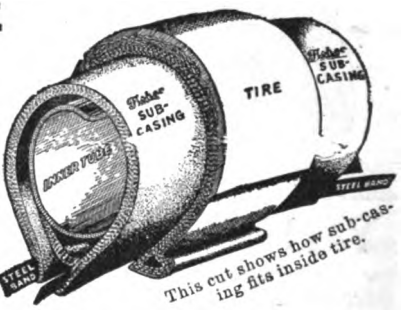
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE LESS TIRES TO BUY

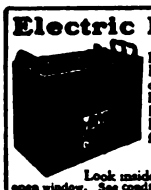
THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.



A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*



FISHER MANUFACTURING CO.

1706 PAYNE AVENUE, :: :: CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.

Electric Row Boat Motor

Make your Row Boat an Electric Launch. Buy a Jewel Detachable Row Boat Motor run by electricity. No odor or dangerous gasoline. Simple, noiseless and powerful. Attaches to any Row Boat and runs on two six volt Batteries. This is our 5th successful season.

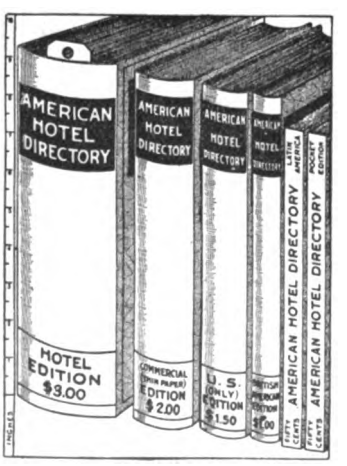
1872 Broadway New York City

THE FIRST 2 BOOKS OF THEIR KIND IN THE WORLD

A Complete Automobile Business Education for $3.50

AUTOMOBILE BUSINESS
By J. H. NEWMARK

The first book in the world that discusses the automobile business from a money making standpoint. Every feature of it is thoroughly discussed from a dealer's view—opportunities that the industry presents today; best auto selling territories; organization; sales; advertising; promotion work; garage; service; accounting systems; and all other departments. 201 pages. Price $2.00 postpaid.



AUTOMOBILE SALESMANSHIP
By J. H. NEWMARK

A complete manual for the man desiring to sell automobiles; how a self propelled vehicle operates; simple definitions a salesman should know; manufacturing procedure in motor car factories—essentials of successful salesmanship; how to secure prospects; selling a car; steps necessary; what constitutes beauty, style, comfort, easy riding, convenience, power, flexibility; economy, durability, safety; how to interest prospects; demonstrations; securing order; woman in the case; trading problem; electric vehicles; trucks; etc. 121 pages. Price $1.50 postpaid.

Address all orders for the above books to

THE MOTOR VEHICLE PUBLISHING CO.
71-73 Murray Street, New York.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table on North and South America, from Bermuda to Hawaii inclusive.

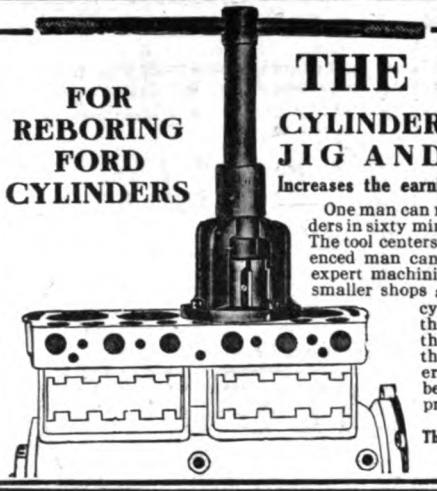
COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.



All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

FOR REBORING FORD CYLINDERS

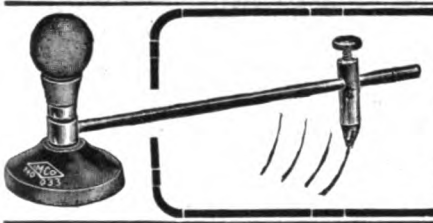
THE DAVIS
CYLINDER REBORING JIG AND REAMER

Increases the earning power of your shop

One man can rebore a set of four cylinders in sixty minutes with this machine. The tool centers itself, and an inexperienced man can do as good a job as an expert machinist. With this tool the smaller shops and garages can rebore cylinders and guarantee the work to be as good as the larger dealers with their expensive machinery. Makes the motor better than new. Write for price and full particulars.

The Hinckley Machine Works
Hinckley, Ill.

THE
BENTON
"THE CASE-HARDENED PLUG"

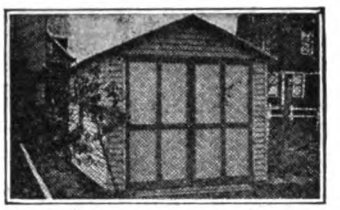


An unbreakable, wound mica insulator quickly cleaned by opening metal-to-metal joint and scraping or washing mica. Joint always gas tight. No deterioration from cleaning. Case-hardened wrench and thread surfaces. Service guaranteed.

Price $1.00

Write for our liberal Agency Proposition and a copy of Booklet shown.

L. F. BENTON CO.,
VERGENNES, VERMONT
New York Office: 116 Nassau Street



No Need to Keep a Stock of Headlight Glasses

This circular glass cutter cuts perfect headlights 2 to 22 in. from plain and sheet glass, any thickness. Saves its cost the first time used. Style No. 033, sample 50c.

Discount to Dealers. Booklet Free.

SMITH & HEMENWAY CO., Inc.
83 Coit Street, Irvington, N. J.

FAIR LIST PRICES FAIR TREATMENT

GOODRICH TRADE MARK TIRES

Start Your Customers Right With

GOODRICH Tubes

A TIRE is no better *than the tube* in it. For after all a *shoe* is but an armor to *protect* the vital part within it—the *tube* that holds the LIFE BREATH of the tire.

It is the duty of dealers to fix this fact in the minds of their customers together with the intense importance of getting the *best tube* to be had.

To help you determine the best tube, we ask you to take in your fingers a GOODRICH BROWN TUBE, and compare it with any other tube.

The very feel of it—its texture, its elasticity, as flexible as a big rubber band for all its tough thickness—tells you the striking difference.

Goodrich Brown Tubes cost more than other tubes, but a dealer should impress upon a customer that *cheapness* in a tube at the *beginning* means *costliness* in the *end*.

Goodrich also has an excellent standard tube at a lower price—THE GRAY TUBE.

Assure your trade that Goodrich tubes—another triumph of Goodrich's forty-eight years experience in rubber compounding—are the best "tubes for him in any case."

'Round and 'Round Table Mountain

On the outskirts of Cape Town, South Africa, there is a strangely shaped mountain, having a top as flat as a table. It is called Table Mountain. This mountain, over 30 miles in circumference at the base, plays a silent part in one of the many demonstrations of the unusual qualities of

TEXACO MOTOR OIL

The following letter tells the story:

Cape Town, March 7th, 1916

The Texas Company
(Export Dept.)
17 Battery Place, New York.

Dear Sir:

We have just had the pleasure of having a conversation with the Superintendent of the City Tramways of Cape Town, who, as you are aware, operate a large bus service around Table Mountain (a distance of 32 miles).

It became recently necessary to do some slight repairs to a truck, and while it was being held the Superintendent decided to take a look at the engine. The carbon was removed after a run of two years and two months, the truck doing a total of 11,000 miles, and in the service required of this vehicle the engine is kept running all the time on account of having to get out of the way of the different trams.

The average amount of carbon found on each of the Pistons was 4.519 grams, a total of 18.076 grams for the four pistons. All bearings were found to be in a most satisfacfory condition and an examination of the cylinder walls, piston and rings denoted their condition to be perfect.

Yours very truly

(signed) D. E. IRWIN.

Texaco Motor Oil will give just as good service in your car as it did in this Cape Town truck.

The next time you buy motor oil buy Texaco. The best way, the safest way, to buy is in one or five gallons cans. You can identify Texaco by its clear, clean color.

No Cranking—Just Riding!

Motoring loses its lure when a woman has to perform the hard labor of cranking.

Where the powerful, invisible, obedient sinews of electricity attend to the cranking, the joys of motoring are multiplied and driving becomes all pleasure.

Electric-cranking of Ford cars attains its highest perfection in the new, but already famous,

STARTING & LIGHTING TWO-UNIT A·B·C SIX-VOLT SYSTEM FOR FORD CARS

Experienced Ford dealers no longer experiment with incompetent Ford starters. They concede, and thousands of A. B. C. owners concede, that this greatest of all Ford accessories conforms more closely to Ford engineering and construction than any other starter in the field.

All over the world, in all weathers and all climates, the A. B. C. starts any Ford and lights any road at pressure of button.

Simple, compact, easiest to install, longest lived. Puts Ford starting in the same class with the highest priced cars.

Weight evenly distributed on both sides of engine by units. No drag or strain on motor from starting or generating. Noiseless in operation. A fibre, leather, and metal belt, moving in a V-type pulley, gives the highest pulling contact. Guaranteed efficient and mechanically correct.

Ford dealers, who have not yet brought to their customers the overwhelming advantages of the A. B. C., should at once fill out and mail the attached coupon, and learn the terms of our generous 1917-1918 dealer proposition. Once an A. B. C. dealer, always one.

A. B. C. Starter Co., Detroit, Mich.

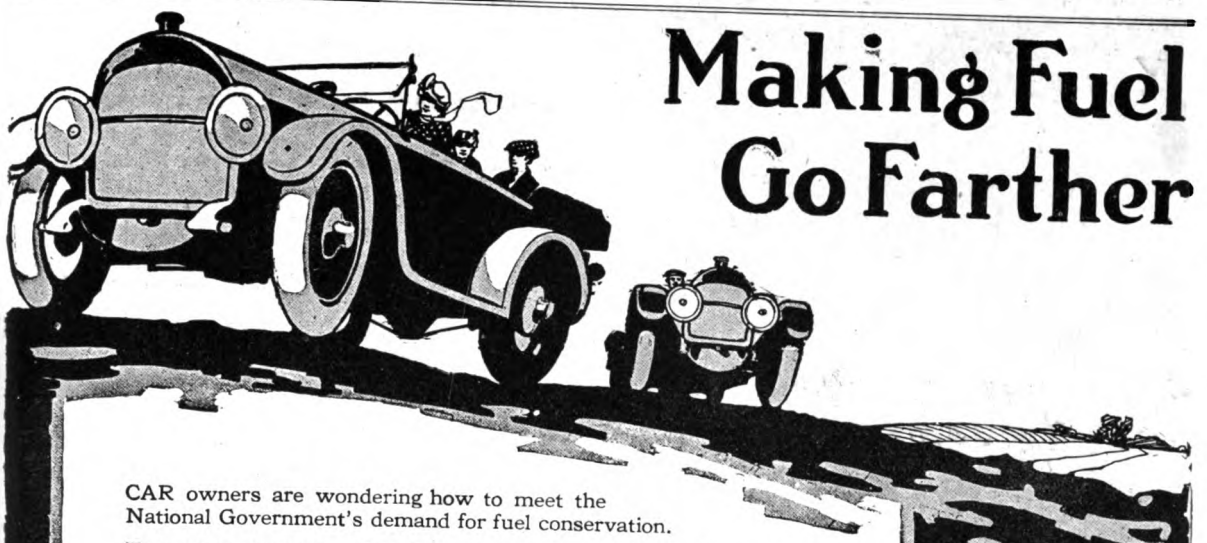
Your Guard Against Motoring Troubles

ACCIDENTS will happen. They cannot be prevented. No one knows the day nor the hour of the day that will bring tack or nail or glass into contact with your tires. But, one can protect oneself from the long delays that those accidents may occasion. And the big helps in emergencies are Firestone Accessories.

Firestone Cementless Tube Patches are excellent examples of how much Firestone quality counts in "first aids." Easiest to apply. Always stay put. Tab on protecting muslin permits quick removal for motorists in a hurry.

The Firestone accessory line includes Hook-On Boots for Clincher or Straight-Side Tires, Lace-On Boots, Blow-Out Patches, Cure-Cut, Cement, Air Pressure Gauges, Tire Tape, Tire Mica, etc.



They embrace every emergency need. They provide first quality "first aid" when tire accidents threaten to delay. Your garage can provide you.

Making Fuel Go Farther

CAR owners are wondering how to meet the National Government's demand for fuel conservation.

Two ways are open. One is to use their cars less. The other and pleasanter way is to make fuel go farther by installing

McQUAY-NORRIS LEAK-PROOF PISTON RINGS

The average owner doesn't realize how much gas is wasted by old piston rings. Because he can't see the leakage, he doesn't think it amounts to anything, but you know it means a lot of lost mileage in a season.

Get your customers to use McQuay-Norris LEAK-PROOF Piston Rings. That's the only way to utilize every particle of power in every drop of fuel. The rings are wonderfully flexible and close-fitting; have absolutely equal bearing at every point, yet with light enough tension not to cause unnecessary friction loss.

Immediate service is the great thing about these rings. Anywhere—any time—you can get exact size rings for any make or model of motor, and thus earn the customer's satisfaction over a quick job. Over 300 jobbing and supply houses carry complete service stocks. Any oversizes, widths or diameters, are always available at the factory.

Get this Booklet—it's ***Free***—"To Have and To Hold Power", the standard handbook on gas engine compression. Every garage and repair man ought to read it. Write Dept. R.

Vesta Searchlights

Absolutely Dependable

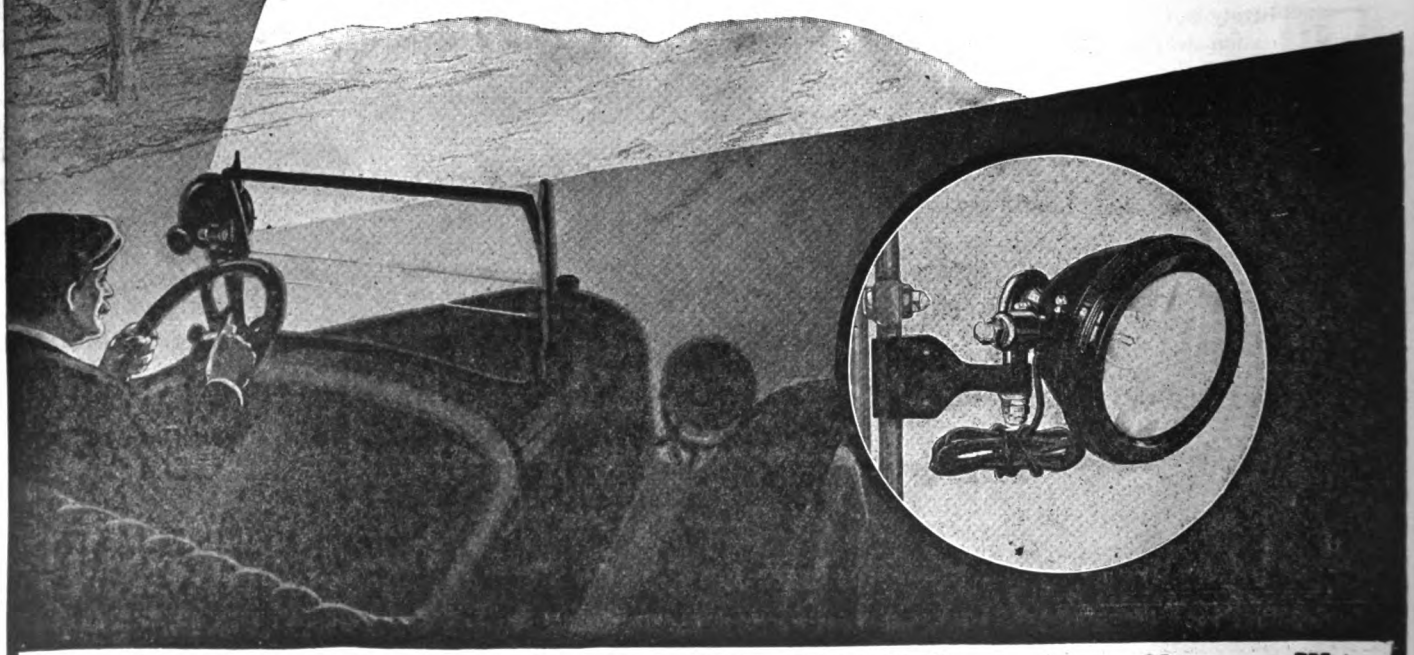
In these days it isn't a case of teaching the motorist the advantages of a Windshield Searchlight.

He knows that.

It's now a case of showing him the best.

That's what he wants and must have.

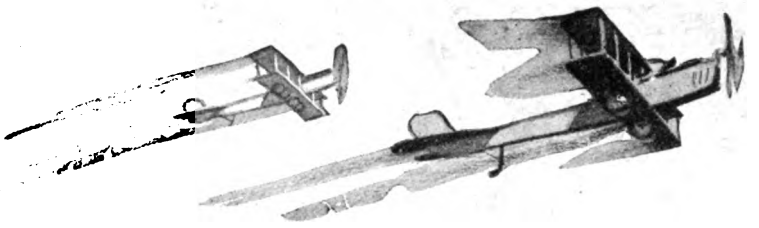
$5.00 to $7.00



Here are a few of the many good things you can show him about the VESTA—a few of the things that make the Vesta absolutely dependable; that will make certain sales and consequent good profits for you:

Cutler-Hammer Switch in handle; machined taper joints; best malleable iron bracket; perfect attachment that fits all makes of cars; five feet of best conductor cord; doors hinged on both sides, can't rattle. New Mazda Nitrogen Bulbs; heavy gauge steel doors and body; German silver handle cap.

In fact, in the Vesta you will find that every essential to convenience and efficiency has been met. A powerful, versatile, sturdy lamp; throws a beam 800 feet; light in weight and easy to manipulate; can't rattle or jolt loose; will turn and remain in any position—it stays put.



And remember the same high quality represented in the Vesta Batteries and other Vesta lighting accessories are embodied in these wonderful Searchlights.

Investigate them—learn more about them. Let us send you prices and complete information. Write today.

Rajah enlists in the U. S. airplane service

Rajah Spark Plugs have enlisted for service in France. They will help fire the big American airplane fleet to victory on the western front.

Before the war Rajah Spark Plugs were standard equipment for our Army and Navy airplanes. They made so good in service that the Government continues their use.

A spark plug dependable enough to safeguard a fighting aviator's life is a pretty safe plug for a car owner to use. Talk up these Rajah records to your customers. It makes it easy to sell the first set. Rajah service will sell the rest. Your jobber can supply terminals for all models and all makes of motor car.

RAJAH *SPARK PLUGS*

RAJAH TERMINALS AND ADAPTERS

are furnished so that Rajah Plugs can be used on any car not equipped with the Rajah type of Clip Terminal. Any size exchanged if desired

Rajah Regular Clip Terminal
Adjustable to any cable. With the extra collar supplied fits any make of plug.

Rajah Thumb Nut Terminal
Adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six, Pullman.

Rajah Ferrule Clip Terminal
With any size ferrule required. Fits any make of plug with the extra collar supplied.

Rajah Packard Terminal
Adapter for Packard 4 and 6 cylinder.

Rajah Stud Termina
Adapter for Buick, Chevrolet, Oldsmobile.

Rajah Ball Terminal
Adapter for Franklin. Special type for Willys-Knight.

An arrangement has been effected whereby the Maxwell Motor Company has leased for a period of five years the properties of the Chalmers Motor Company.

The immediate effect of this transaction is:

1. The Chalmers car will be continued under the Chalmers name for a period of five years.

2. Those distributors or dealers who have been successfully marketing the Chalmers car will continue to do so.

The appraisers of the property and their engineers report the current Chalmers model a good car and the Chalmers plant a wonderful factory.

The first move we have made is to increase the efficiency of the Chalmers organization.

The second move was to place behind the Chalmers car the resources of the Maxwell Motor Company.

This is a business transaction between two automobile companies of probably no more than ordinary interest to the public but important to you if you have thought of buying a Chalmers for these obvious reasons:

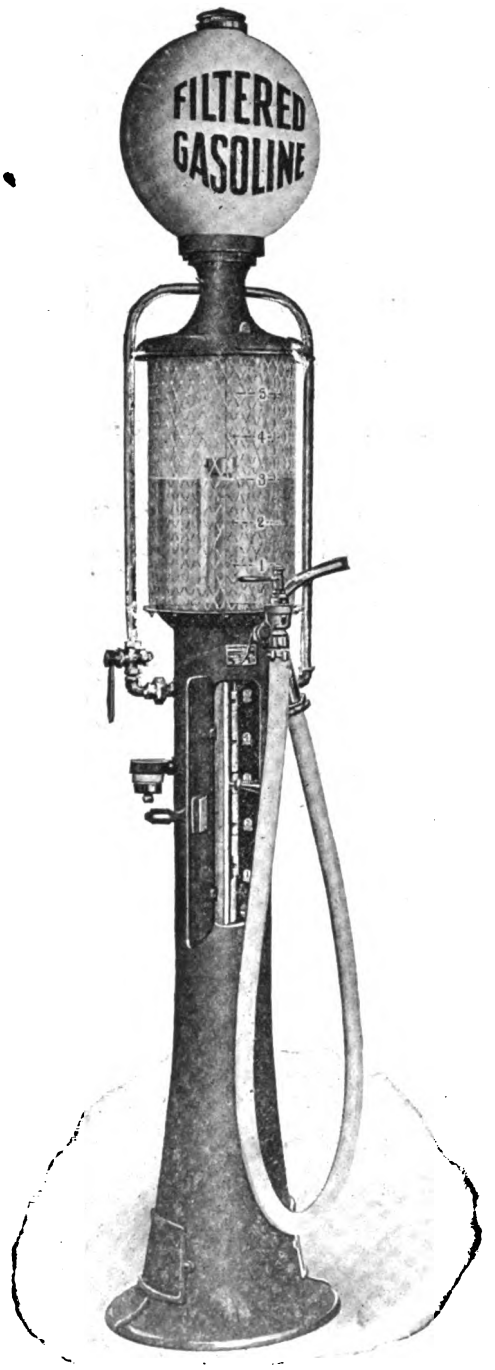
1. You obtain a good car.

2. You obtain a car produced in a magnificently equipped plant.

3. You obtain a car produced by an organization materially strengthened by the addition of able executives.

4. You obtain a car produced by an organization materially strengthened by additional financial resources.

5. You obtain a car from a distributor or dealer who will have the support of this organization.



In this way all three of us prosper in the transaction.

Walter E. Flanders

President and General Manager
MAXWELL MOTOR COMPANY, INC.

CASING HEAD GASOLINE

Here's one grade of gas that most pumps can't measure.

One experience always proves this to the dealer.

They simply can't handle it. Why?

"That stuff's too light for any pump," a dealer will tell you.

But it's not too light, there's no liquid so light, that it can't be handled quickly, accurately and without loss, by the

GUARANTEE VISIBLE PUMP

As an engineer, dealer, garageman, anyone with knowledge of the construction and operation of gasoline or oil pumps, compare the simplicity of the Guarantee Visible with the complexity of any other pump. Ask us to show you.

Then keep in mind this point—*visibility.*

That's what the motoring public demands today.

Write us at once for the pump book. Address Dept. 9

Make Big Money on your "tow-in" jobs with a WEAVER Auto Ambulance

for crippled cars

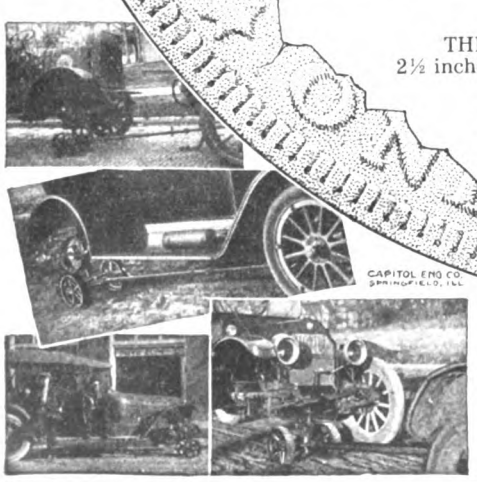
WRITE FOR COMPLETE CATALOG

AT "one dollar per mile", or whatever YOUR basis of charge may be for tow-in services, the Weaver Auto Ambulance will pay for itself in a few trips.

It enables one man to run out and tow in a crippled car in one-fifth the time it would ordinarily require two or three men to do the same work with the improvised methods usually employed.

The strong, rugged construction and the high, broad wheels equipped with roller bearings, make it possible to tow cars over country roads at a rate of 15 to 20 miles per hour. The secure clamping construction eliminates all chance of accident.

A "One-Man" Equipment



Though amply strong, this Ambulance is sufficiently compact and light to enable one man to handle it with ease. When under the front axle, the tongue does the guiding—so it is not necessary to have an operator in the rear car.

For Front or Rear Axle

The Weaver Ambulance is the product of a careful study of the conditions to be contended with in this kind of service. It will attach to either front or rear axle and has a wide range of adjustment to adapt it to any car.

Construction

THE TELESCOPING STEEL TONGUE is adjustable every 2½ inches from 6½ to 11 feet. The axle is 1¼ inches in diameter and extends entirely through the frame, giving ample support for the heaviest loads. The wheels are cast steel, 14 in. in diameter.

You Can't Break These Cast Steel Wheels

One of our favorite demonstrations is to have a customer try to break a wheel with a ten pound sledge.

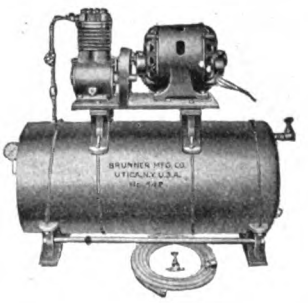
They never fail to recognize
The Brunner Sign which Signifies-
A Service True-which Satisfies-
The Motorists who are Brunner-wise

YES, BRUNNER SERVICE SATISFIES

As the winter months draw near, Mr. Garageman, you should look around you and make sure that every detail of your service is as proficient as it should be—for instance, your compressed air service—is that what it should be? Is it a truly satisfactory service such as Brunner Service?—the one compressed air service that always satisfies.

DON'T WAIT TILL SPRING TO IMPROVE YOUR SERVICE—NOW IS THE TIME TO INSTALL BRUNNER EQUIPMENT

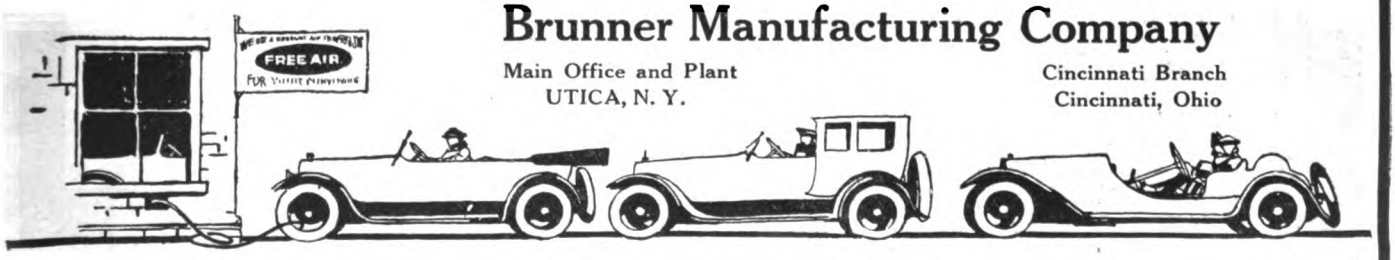


because it would help you over the hard winter months and make you ready for the Spring as well—your regular patrons would appreciate Brunner Service and it would bring to your door this Winter the trade of the Brunnerwise Motorist, which would help some.

INVESTIGATE THE BRUNNER AIR COMPRESSOR

There are seven standard sizes and any possible number of motor and belt driven combinations to suit the garageman's requirements—there are no extravagant promises of impossible performances—but simply the same good substantial business proposition it has always been for the garageman.

There are more Brunner Air Compressors in use in the garages than there are air compressors of any other make—the reason is obvious.



The BRUNNER Air Compressor is the Pioneer of All Garage Air Compressors, Because—

The Brunner has been demonstrating its sterling value in the garage ever since we have had garages—it is and always has been a real garage air compressor, designed and developed in a plant which was planned and built for the exclusive purpose of manufacturing Garage Air Compressors—backed by an organization whose entire time and attention has always been devoted to the building of Garage Air Compressors exclusively.

Write for our No. 14 Catalogue and Handbook on Compressed Air and get the facts.

Let us send you the name of the Brunner Jobber covering your town—he will be glad to recommend and guarantee a Brunner Outfit that will do your work right.

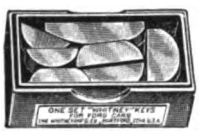
"WHITNEY" KEYS

FOR THE

WOODRUFF SYSTEM

For the benefit of dealers, garages, and repair men, we are prepared to furnish our keys put up in two assortments. Every garage and repair man should keep these on hand. They may be purchased from the leading jobbers or ordered direct from the factory.



Regular Assortment

One hundred keys of the sizes most likely to be required for repair work.

Ford Assortment

One set of keys for the Ford car. These keys are of the special material and special treatment specified by the Ford Motor Company.

THE WHITNEY MFG. CO.

HARTFORD, CONN.

Chains Keys Hand Milling Machines

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

Brictson Pneumatic Tires

Try at Our Expense this wonderful Repair Outfit

Weight 90 lbs. boxed

Stewart Handy Worker "SIX-IN-ONE"

Price Complete $14

Handiest combination of tools you ever saw. Just the thing for the garage, public or private. Wonderful value for the money. If you were to buy separately all of the tools you get with this outfit, and get tools of the same high quality, strength and durability, THEY WOULD COST YOU AT LEAST $25.

A COMPLETE, COMPACT WORK-SHOP

A strong, practical anvil; powerful vise up to 4½ inches, width of jaw 4 inches; a sure-grip steel pipe vise, takes up to 1½ in. pipe; A Corundum grinding wheel 5 inches by 1 inch; a two-speed drill press with 2 drills; a metal cutting wedge and driving mechanism of three speeds—direct, 4 to 1 and 16 to 1—easily regulated by changing handle grip. It operates grinding wheel, buffing wheel, and many other similar tools.

With the STEWART HANDY WORKER you can do car repairing, blacksmith work, home repairing, make plumbing repairs, keep knives and other tools sharp and in good working condition.

OUR SPECIAL TRIAL OFFER

Send for one of these great combination outfits today. Order with this understanding: If you aren't thoroughly satisfied in every way, you can ship it back and we will return every cent you paid out. THOUSANDS HAVE BEEN SENT OUT ON THIS BASIS AND NOT ONE HAS BEEN RETURNED.

Send only $2 with your order, and pay the balance when it arrives. BOOKLET GLADLY MAILED ON REQUEST. But the best way to appreciate this wonderful outfit is to order it, on our special trial offer.

AUTO THERM

HEAT INDICATOR

REGISTERED TRADE MARK

Will Safeguard You Against Overheating

In the new AUTO THERM is solved, at last, the problem of detecting overheating in ADVANCE of damage to your motor.

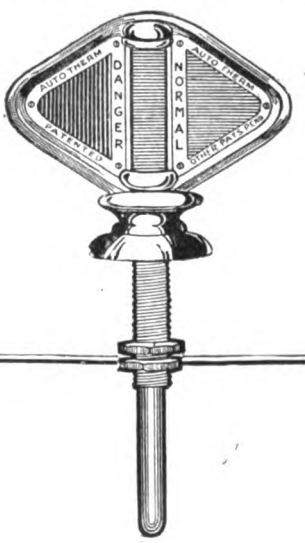
The AUTO THERM works directly in contact with the water in your radiator—NOT THE STEAM RISING FROM IT. By the time steam is generated, the water is boiling and serious harm may be already wrought your engine.

The warning signal of the AUTO THERM is plainly visible, day and NIGHT, from the driver's seat. Instead of a rise of a thin column of liquid, a broad ribbon of color flashes you warning of dangerously rising temperature.

Two transparent colored panels on either side of this "ribbon" maintain a continual color comparison, eliminating all guesswork and the eye-strain called for to read diminutive numerals and letters, as in the old-fashioned type of heat indicator.

A child could hardly fail to notice the signal of the AUTO THERM.

And the AUTO THERM Retails at a *Reasonable* Price:



Standard—For Large Cars, $3.50 List
Junior—For Small Cars, 2.50 List

Also Furnished with Your Favorite Emblem – Fraternal or Patriotic

"NORMA"

"NORMA" BALL BEARINGS

(Patented)

So small a thing as the bearing of the magneto or lighting generator may set the limit to the service capacity of a car or truck. The failure of such a bearing, impairing the ignition or the lighting, may result in condemnation of an otherwise high-class car or truck.

The almost universal standardization of high-grade magnetos and lighting generators on "NORMA" Ball Bearings is proof of the confidence the makers of these accessories have in "NORMA" Quality as a safeguard to themselves and to the makers and owners of cars and trucks.

HOLDFORD BRAKES

SAFETY FIRST

PRACTICAL

POSITIVE

ASSURES YOUR SAFETY

HOLDFORD BRAKES are high-grade external contracting brakes for Ford cars which can be easily and quickly installed to act from the hand lever as emergency brakes, or from the foot pedal as service brakes. Designed in accordance with the best engineering practice; the band and brace are of steel, the toggle crank and bracket are dropped forgings and the lining J-M non-burn. Do not drag when released, no readjustment for wear is necessary and oiling is easy.

HOLDFORD BRAKES save wear and tear and will be attached by the wise owner on his pleasure car, delivery car or truck. They will positively stop a Ford with locked wheels on *any grade, at any speed, with any load.* Not necessary to remove old brakes.

When Ordering State Whether for Hand or Foot.

Uncle Sam Knows the Real Answer

NOT ENOUGH!

Save Leather for Soldiers

To make America's hide supply go as far as possible, hides are being split into five or more thin sheets; but even this saving scheme fails to meet the requirements for soldiers' shoes, harness, equipment, ship upholstery, factory needs, etc., chiefly because too much hide leather is used by the public in places where high grade leather substitutes will serve as well or better.

For instance, the leather upholstery of one average size automobile would make twenty pairs of soldiers' shoes. For years America's largest producers of automobiles have successfully used

DU PONT FABRIKOID
REG U S PAT OFF

Motor Quality

for upholstering their cars. Thousands of owners never even knew their cars were not upholstered in leather, because Fabrikoid looks and feels just like the finest leather and actually wears better than the coated split leather most used for upholstery of automobiles not covered with Fabrikoid.

It is true that some few high priced automobiles are still upholstered in genuine grain leather of good quality.

But the pride of possession of luxurious, expensive leather should now yield to patriotic preference for satisfactory substitutes that will divert this leather to more necessary uses.

Uncle Sam Has Set The Pace

The new U. S. motor trucks and ambulances will be upholstered in leather substitutes.

The upholstery specifications for the new Merchant Marine call for "Craftsman Quality Fabrikoid."

What Uncle Sam has found by experience and tests good enough for the Government's severe requirements should be good enough for every loyal American.

If you are a manufacturer using leather, probably part or all of your requirements can be met by some grade of Fabrikoid.

When buying an automobile prefer Fabrikoid upholstery. Help the manufactuaer conserve leather by patronizing those who use good leather substitutes like Fabrikoid.

Every hide displaced by a good substitute helps supply our armies with shoes, our farms with harness and our factories with belting—it helps win the war.

Manufacturers! Write us your requirements and let us co-operate with you.

Send for samples and booklet.

Steer Warms For Winter Driving

BUSINESS BOOSTERS

Dealers throughout the cold-weather territory have found Steer Warms to be great business boosters. They make winter driving comfortable; make more driving and increase the dealers' sales of supplies and accessories. They are easy to sell and sure to give satisfaction. Whatever else your customers may kick about, they'll give you nothing but praise for Steer Warms.

Keep the Hands Warm In Coldest Weather

On the longest drive, in the coldest weather Steer Warms keep the hands warm; and, besides the comfort of Steer Warms, they ward off "bad colds"; make driving safer by keeping the fingers limber and the grip firmer, and they save money on gloves.

Draw Trade

Steer Warms are nationally advertised and up-to-date autoists are on the lookout for them. Put them in your stock and let people know where to find them. They'll draw trade and help you make sales of other things as well.

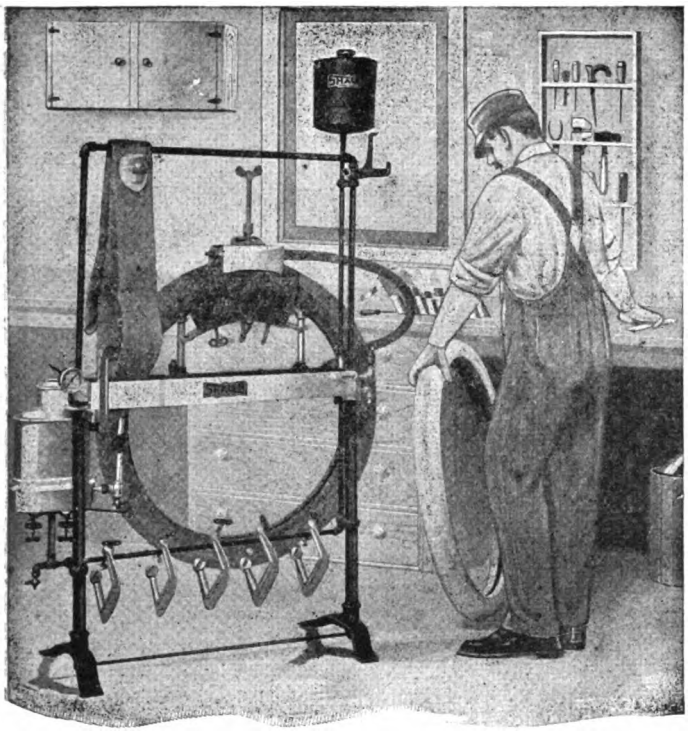
Good Profits

There's a good profit and "big money" in Steer Warms; the retail prices are small and you can sell lots of them. For all gasoline cars, $7.50 the pair (in Canada, $11.00); Special for Ford cars, $5.00 (in Canada, $7.25).

Guaranteed 5 Years

Steer Warms are made of the best material and are absolutely guaranteed in every way; guaranteed against burnout for five years; money refunded if they don't do all we claim for them.

Get the Genuine



Steer Warms are the only hand-warmers in which the heating element is protected, thus insuring uniform heat and unbroken service. Don't experiment with inferior infringements; get the genuine Steer Warms.

We Help You Sell

We furnish to dealers advertising aids and practical sales suggestions. Write for full information and be ready to order in ample time for your winter business.

WALDEN-WORCESTER, INC., WORCESTER, MASS.

FOR REBORING FORD CYLINDERS

THE DAVIS
CYLINDER REBORING JIG AND REAMER

Increases the earning power of your shop

One man can rebore a set of four cylinders in sixty minutes with this machine. The tool centers itself, and an inexperienced man can do as good a job as an expert machinist. With this tool the smaller shops and garages can rebore cylinders and guarantee the work to be as good as the larger dealers with their expensive machinery. Makes the motor better than new. Write for price and full particulars.

LIST PRICE — $20.00

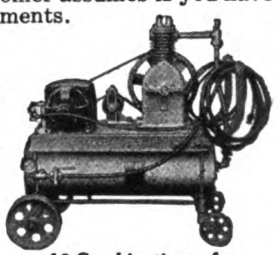
This Screw Plate is very popular among Automobile Accessory Jobbers and Garage Men. It is designed to meet the requirements of the Repair Shop and it does to perfect satisfaction. The O. K. Hammered Dies in this set actually cut easier and much cleaner threads made than with the old style dies. This is entirely due to the extra chip clearance and oiling space provided.

Catalog 8-B tells the whole story.

F. E. Wells & Son Company Division

Greenfield Tap and Die Corporation
Greenfield, Massachusetts

GTD



CURTIS AIR FREE FROM OIL

The Curtis Compressor is the only one designed to prevent flooding the cylinder with more oil than it needs for lubrication. This, because of our controlled-splash oiling system. No excess oil is forced into the air line. **Oil ruins tires**—air free from oil means fewer blowouts and increased mileage all around for your customers, with less tire adjustments to you. Make your place the most popular one in town. An easy and inexpensive way, is to install a Curtis Compressor. The customer assumes if you have the best free air service, you will have the best service in all departments.

Costs No More Than Ordinary Compressors—But Note The Difference

Live garages and service stations are using Curtis Air Compressors. Motorists expect free air service. Why not give them the best and win over new customers by supplying, not only reliable air service, but **Curtis Air—Free From Oil.** A poor air system which shoots oil into the tires, or which is unreliable, drives customers away. Thousands of Curtis Outfits are rendering daily, effective, efficient service all over the country. Your Curtis Compressor can further pay for itself by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools, and many other things. Curtis Compressors are backed by manufacturers who have been specialists in this line for twenty-five years.

10 Combinations of Compressor and Tank Sizes—Any Current

Five Sizes—Tight Pulley Only, or Tight and Loose Pulley

11 Combinations of Compressor and Tank Sizes—Any Current

Makes New Customers—Holds Old Ones

Quickly pays for itself in bringing in new trade and holding the old trade, for it not only is the source of a dependable supply of air when your customers want it, but it also supplies clean, cool air—free from oil. Motorists realize that oil will quickly destroy their inner tubes, and, therefore, look for a station that supplies Curtis Air—Free From Oil.

Curtis Compressors are built to meet the requirements of your business in sizes, arrangements and prices. Send coupon at once for full information and attractive prices. It will pay you to investigate our proposition. *Write us today, or ask your jobber for prices—but insist on a Curtis.*

ANTI-FREEZING SOLUTIONS.

The Cleansing and Preparation of Cooling System for Winter Service.

BY CLIFTON EGERT.

If one will consult any standard dictionary, Webster's, for example, he will find that the word freeze is defined as follows: To become congealed by cold; to be changed from a liquid to a solid state by the abstraction of heat; to be hardened into ice or a like solid body; as water freezes at 32 degrees Fahrenheit. Now during this process of congealing or freezing there occurs an expansion which, although slight, is sufficient to burst any container that is rigid and cannot expand with the congealed fluid.

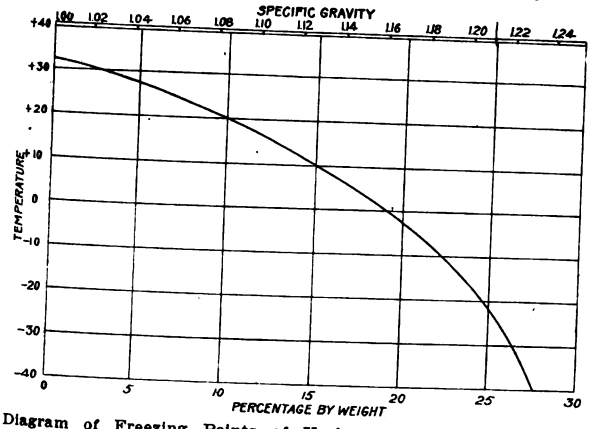

Diagram of Freezing Points of Various Solutions of Calcium Chloride in Water.

Don't Be Caught Napping.

Inasmuch as the water utilized for cooling the automobile engine is susceptible to freezing temperatures which may be expected any day, preparations should be made to repel the attack of Jack Frost. There are three effective methods and these are the use of an anti-freezing solution, draining the circulating system and garaging the machine in a heated building. The last named, however, will require care when the car is left on the street for any great length of time and when the temperature is well below freezing. The emptying of the radiator, etc., is favored by many, but one must be sure that all water is removed. The first named method, the use of an anti-freezing solution, is, perhaps, the best for all around purposes, although there are some who do not favor its use.

Solutions Commonly Used.

The three principal ingredients used for making an anti-freezing solution are calcium chloride, alcohol and glycerine. The calcium chloride is recommended by many car manufacturers and when used care should be taken to purchase none but the chemically pure. The commercial form should be avoided as it contains acid. Crystallized calcium chloride contains about 50 per cent. water of crystallization and dissolves in about half its weight in cold water; consequently eight pounds dissolved in one-half gallon of water will obtain one gallon of the saturated solution. An accompanying chart shows the percentages of calcium chloride and the corresponding specific gravity required to prevent freezing at temperatures ranging from freezing to 40 below zero. This information is also contained in an accompanying table.

Alcohol Solutions Simple.

The alcohol solution is favored by many because it is easily obtained and prepared. An alcohol solution may be made with either wood or denatured alcohol, the latter being alcohol that is made unfit to drink by an admixture of certain substances. The various freezing temperatures of the alcohol solution are shown in an accompanying diagram, also the proportions to be observed in preparing the mixture given in an accompanying table.

Alcohol and glycerine is a combination that is liked by some because of the low boiling point of the latter. The disadvantage of using glycerine is that it attacks the rubber hose of the circulating system, causing the plies of fabric to disintegrate. Another factor mitigating against its use is the cost. Whenever used it generally means renewing the hose in the spring.

Precautions to Observe.

In the use of the calcium chloride, and when employing other than the chemically pure article, one must guard against the action of acid. This can be neutralized by gradually adding ammonia or soda ash and until blue litmus paper no longer turns red when dipped in the solution. Litmus paper indicates if acid be present.

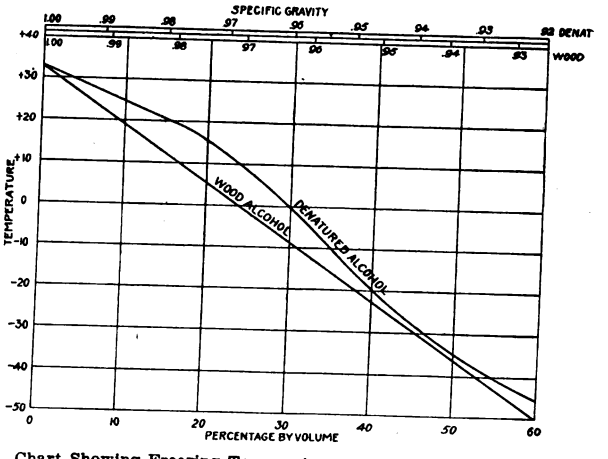

Chart Showing Freezing Temperatures of Alcohol and Water.

Digitized by Google

With the alcohol solution one must expect it to give off an odor when heated and to boil readily when the thermometer registers above the freezing mark or in mild weather. Because of these factors and the tendency of the alcohol to evaporate readily, thus lowering the freezing point of the fluid, many object to the solution. If one employs alcohol it is advisable to purchase and use a hydrometer graduated to read below 1.000. These instruments are sometimes termed pyrometers. They indicate to the user the strength of the solution which should be maintained and according to the requirements of the locality.

Cleansing the Radiator.

It is well to avoid the practice of using any anti-freezing solution until the radiator and other components of the cooling system are inspected for leaks, for the alcohol will escape through openings where water will not pass. It is also important that all "fur," scale or other deposits be displaced from the radiator, matter generally deposited through the use of hard water.

There are several ways to clean the radiator. One is to make a solution of washing soda and water, using as much of the former as the water will take. Drain the radiator and fill with this mixture, then run the engine for some little time. If the water from the radiator is very dirty, is rusty, it may be necessary to give the radiator a second treatment. After rinsing with clean water follow with a 25 per cent. solution of the commercial grade of hydrochloric acid. Flush the radiator with clean water after using the acid solution.

Prepared Solutions.

It is a simple matter to determine when the radiator is clean, as the water will come away fairly clean. Another method of removing rust from the system is to dissolve about half a pound of lye in about five gallons of water. Strain the mixture before placing it in the radiator and run the engine for at least five minutes. As with the other preparations, flush thoroughly with clean water. If one does not care to bother with soda, acid or lye, he can obtain a prepared solution, several of which are marketed. These will clean the system and are, perhaps, more convenient and easier to use than the mixtures described. Any and all leaks should be remedied before using any anti-freezing solution. In conclusion, the writer suggests that the automobilist take steps to avoid the possibility of the circulating system freezing, for by so doing a large repair bill will be averted.

TO COMPETE WITH FORD.

New Overland Car Costing Under $500 to Be Made By Willys-Overland Co.

What has every indication of being the first serious challenge to the Ford car and the Ford Motor Co., is the announcement of the Willys-Overland Co. that it will market a car that will sell for under $500, have electric lighting and starting and a number of features not included in the Ford vehicle.

The new machine, which will be produced in large quantities, has a four-cylinder power plant, will weigh about 1,550 pounds and has a two-speed sliding gearset. The bore and stroke of the engine is 3¼x4 inches, and among the features of the chassis is the frame which combines the cross members and running board supports in one. Even the battery box is utilized to brace the frame instead of hanging from it. A unique spring suspension eliminates the need of shock absorbers.

It is stated that not only is the car unusually comfortable but it will create records for fuel and tire consumption. In appearance and style the car has everything to commend it. The fenders are crowned and merge gracefully with the hood lines at front and with the body at the rear. The top is a one-man design, and the equipment is very complete.

The Willys-Overland Co. is the second largest individual manufacturer of motor vehicles in the world, the Ford being at present the leader. John N. Willys and his engineers are confident that mechanically good as is the Ford car, they have far exceeded it in their present design. Work on the machine was started a long time ago, and those who have seen the car state that it rides as nicely as a heavy vehicle of 130-inch wheelbase. Despite the shortage of labor and material the Willys-Overland Co. is in a position to manufacture and deliver an enormous number of cars. The car will be exhibited at the New York Show.

If the new owner will learn to make use of the throttle when desiring to check the speed of the car, he will save his brakes. Using the brakes instead of the control is a common fault with the new driver.

OVERHAULING THE MOTOR CAR.

Steps Necessary to Prepare the Chassis for Winter Driving.

BY C. P. SHATTUCK, M. E.

Motorists intending to use their machines this winter should give them a systematic inspection and overhaul. The preparation for the cold months should be thorough, but it need not involve any

howing Flywheel with Crankshaft, Connecting Rods and Pistons Removed from Engine. Rods Should Be Adjusted, Carbon Displaced from Pistons and Rings, and Slots in Rings Placed Equidistant.

reat labor or expense, particularly the late model n which the maker has incorporated means for aking up components subject to wear. Machines hat have seen considerable service will require more ttention than those which have been driven a few housand miles. In the latter event it is probable ittle will be necessary other than removing carbon leposits, reseating the valves, making minor adjustments and renewing the supply of lubricants.

What the Owner Can Do.

Some motorists hesitate to undertake the work f placing the chassis in condition for winter service ecause of a lack of knowledge of mechanics. The riter does not advise the novice to attempt the isassembling, adjusting and reassembling of the ore complicated parts, work that is best left to the xperienced, but the owner can accomplish successully the greater part of the work and thereby effect considerable saving in expense.

How to Use the Expert.

As it is possible to call in the expert for adjustments requiring experience one can easily clean and prepare the parts, work that ordinarily costs from 60 cents to a dollar the hour in the repair shops. It is not a difficult matter to arrange with some automobile mechanic to spend a few hours with one each Sunday, for as a rule a repairman is glad of the opportunity to earn a little extra money. Generally these experts will explain the work as it progresses, and the knowledge acquired will prove extremely valuable. Many times an arrangement can be made whereby the expert oversees the work and will make the necessary inspection of the adjustments, etc. This is an excellent plan, as the owner learns to do the work right and avoids the expense occasioned by the novice making errors in the work through ignorance. The writer recommends the method for the simple reason it combines the practical with the technical; that is, when the expert will explain the why and wherefores of each component the owner obtains a schooling not possible under ordinary circumstances.

How to Start the Work.

In the overhaul one must be systematic and this will apply to both the partial and thorough overhaul. The inspection, which precedes any work, should be equally as thorough. The steps to take and progressively, are given in an accompanying table. It is not essential that they should be followed as printed, but can be varied to meet the requirements of design, etc. As may be noted, the phrase, "Remove old lubricant, clean and renew supply," occurs frequently. This is important.

Cleaning the Radiator.

The first step in the work is to make sure that the circulating system is free from rust and deposits. Inasmuch as complete instructions are given elsewhere in this issue for preparing the cooling system for winter, the subject will be dismissed. Wash the body and chassis clean, then remove the lamps, extra tires, accessories, etc., laying these to one side. In a complete overhaul it is well to remove the body, but before displacing it, and particularly if the fuel tank be located in the cowl and numerous connections exist, shut off the fuel supply at the tank. Study all connections and devices attached to the body and which lead to some part of the chassis. Make absolutely sure that all are free before attempting to lift the body from the frame. After

HOW TO PROCEED WITH THE WORK OF THE OVERHAUL.

POWER PLANT.

Clean circulation system.
Drain crankcase.
Clean oiling system.
Remove grease and dirt.
Clean fuel system.
Remove carbon deposits.
Clean pistons and rings.

displacing the body place it on suitable support, and raise the top.

Power Plant Connections.

Before attempting to remove oil, grease and other foreign elements from the power plant, cover the magneto, carburetor, generator, motor starter or

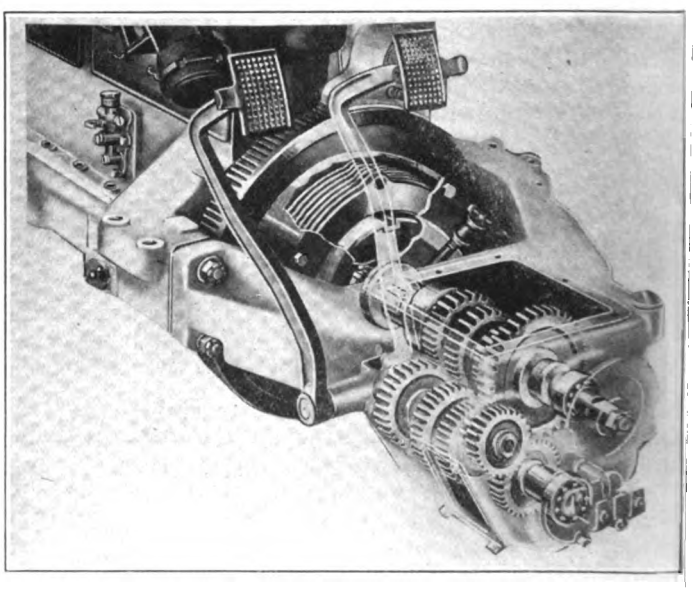
Showing the Cone Type of Clutch, Universal Joint and Components Requiring Inspection and Adjustment in the Overhaul.

timer-distributor with cloths to prevent the cleansing fluid from reaching these members. Inasmuch as gasoline is expensive, use kerosene for cleaning. A stiff brush combined with a little elbow grease will work wonders. As it is an easy matter to displace wires and a difficult task to replace them correctly, study all connections between the power plant and the dash, tagging wires, etc. In marking the spark plug wires start with the cable leading to the first cylinder and attach a tag with the mark No. 1 to the timer or distributor terminal. Leads between the timer-distributor and coil can be similarly marked, and by using tags for each connection and properly numbered, mistakes will be avoided in the replacement of the wires.

Cleaning the Oiling System.

If the motor is not to be overhauled, and only the carbon removed and valves ground, the lubricating system should be emptied of the old oil. Open the petcock under the engine and drain the crankcase. Refill with kerosene and run the engine about a minute but not at high speeds. Drain kerosene and refill with fresh, clean oil. The method of doing this work will depend upon the type of lubricating system. The splash is easily cleaned as the kerosene can be introduced through the breather or other filler opening.

Dismantling the Engine.



The next step is to strip the motor, removing the intake and exhaust manifolds if these be of the detachable type. Displace the spark plugs, inlet and outlet water pipes, etc., and after loosening the nuts securing the cylinders, the last named can be removed, giving access to the pistons and rings. Carbon should be removed from the heads of the pistons, cylinders and grooves of the pistons. Displacing the crankcase will afford access to the main, connecting rod and camshaft bearings and these if worn should be adjusted. Generally the removal of a shim or two will compensate for the wear. The tightness of the bearing will depend upon the type, but this data is usually contained in the instruction book, which should be consulted as the work progresses. If not familiar with the work of taking up bearings obtain the services of the expert. Whenever possible adjust a bearing or so under his supervision.

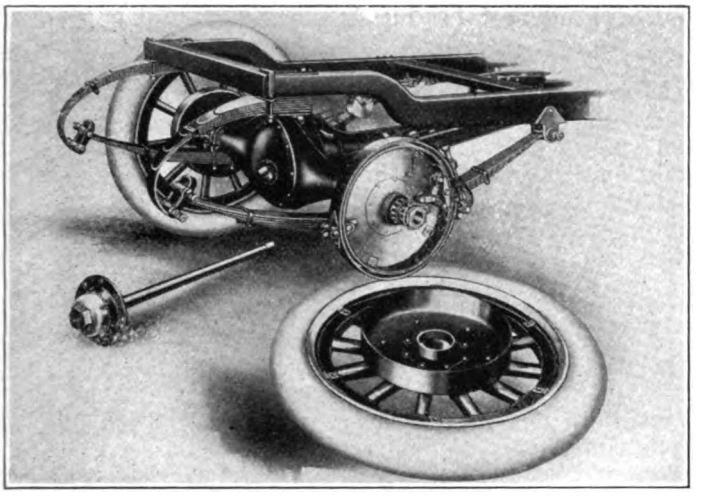
Overhaul the Clutch.

The clutch requires attention particularly if it has been slipping or is harsh in its action. Leather-faced types become dry and can be restored by the use of neatsfoot oil, while the wet plate type of multiple disc should be thoroughly washed with kerosene and the old lubricant replaced with new. After introducing the kerosene declutch and clutch several times to work the fluid between the plates, and it is a good plan to crank the engine with the plates disengaged. This will work out any dirt that may be present between the plates. In renewing the supply of oil it may be that a thinner grade may be recommended by the car maker for cold weather. Inspect and adjust the clutch springs if the clutch does not grip properly, and test the action of the brake or clutch stop. The linkage operating the clutch should be carefully cleaned, adjusted and lubricated.

What the Gearset Will Need.

Coming next to the gearset, remove the lubricant and wash the gears, bearings and shifting forks. Test the shafts for end play and if adjustable eliminate the lost motion. Also test the mesh or alignment of the gears and if faulty correct same. The shifting mechanism may require a slight adjustment, particularly if a gear shifts itself when in service. Examine the dogs of the high-speed gear

Phantom View of Gearset and Showing Bearings and Shifting Mechanism. Gears Should Align and Mesh Easily and Shifting Forks Adjusted. The Clutch Should Be Cleaned and Adjusted and Lubricated if of the Wet Type.



and if badly worn have them trued up. Failure of the high to remain in speed will be revealed by an inspection of the gearset and its linkage. Clean, inspect and lubricate the linkage between the shifting lever and the gearbox.

Remove all lubricants from the rear axle, clean and inspect the gears, particularly the mesh of the pinion and gear, and if there be side or end play, correct same. If roller bearings are utilized care

Digitized by Google

must be taken not to adjust them too snugly else damage will result. The adjusting of the mesh of the pinion and gear requires experience, and it is suggested that the expert be called in to do this work, unless, of course, one is entirely familiar with it.

While on the rear axle look over the universal

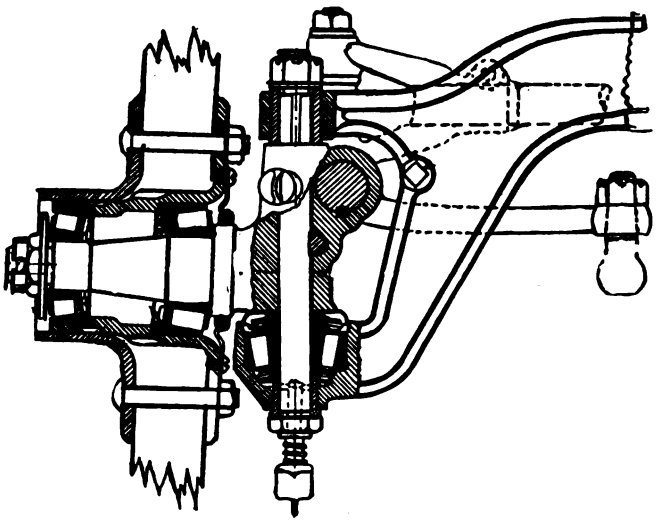
Illustrating Full Floating Type of Axle with Shaft and Wheel Removed to Show Bearings and Brake Adjusting Mechanism. In the Overhaul of the Rear Axle Should Be Included the Cleaning and Lubrication of Springs.

joints. These are frequently neglected until badly worn. They are a most important part of the power transmission system and, despite the educational work conducted by the manufacturer, owners will neglect these joints. Clean the joints and if worn take them to the expert for restoration of the parts. Use the lubricant recommended by the maker of the joint.

Torque Arms and Radius Rods.

The torque arms and radius rods require attention and these should first be cleaned, then tested for play or lost motion. With some types it is a simple matter to restore worn parts, while others are more difficult. If the car has been run a large number of miles, and particularly if the mixture has been slightly rich, one is likely to experience muffler trouble. This member ought to be cleaned thoroughly, for with some types the openings fill readily, setting up a considerable back pressure which not only cuts down the energy of the engine but contributes to hard starting. Sometimes the muffler can be cleaned by tapping with a wooden mallet. The deposits will be removed by the exhaust when the engine is started.

Brake Overhaul Important.



The writer could discourse for some time on the subject of brakes, one of the most important components of the machine. In overhauling the brakes it is best to entirely disassemble the mechanism and the linkage. By so doing all rusty and worn parts are easily noted and not only is the work of restoration made easy but it insures proper lubrication previous to the reassembly. It may be that the linings require replacing or the levers, cams and studs are so badly worn as to interfere with transmitting the proper leverage. Very often the linings are blamed for failures of the brakes to hold when the worn members in the linkage practically make it impossible to obtain the correct leverage. The brake part of the overhaul requires extreme care, particularly the adjustment, for any friction between the lining and brake drums cuts down power and decreases fuel efficiency. A simple test of the brakes is to stop the car after a short run and place the hands on the drums. If warm, it indicates friction which should be eliminated. Right here the writer desires to emphasize a point frequently overlooked by the repairman and that is worn bearings may be responsible for faulty brake action. For this reason the bearings should be adjusted before tackling the brake members.

Do Not Slight Steering Gear.

The overhaul of the steering gear is most important and no part of the work should be slighted. End play of the steering column can be eliminated and lost motion in the wheel corrected by remeshing the gears, bringing a new section in mesh or by renewing worn bushings with new. Repack the gears with grease or oil as directed by the maker. Play in the drag link can usually be removed by adjusting the position of the plug in relation to the ball end of the arms, but extreme wear of the linkage of the tierod, yokes, etc., will require new bushings and bolts. These parts should be well lubricated and where boots are used these packed with grease.

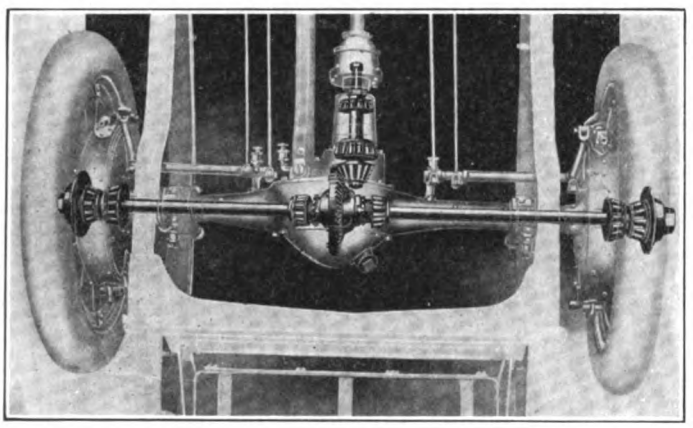
Adjustment of Bearings.

The bearings of the front wheels should be cleaned, lubricated and adjusted, and if of the ball, race and cone type and worn, replace with new. Never use one or more new balls with old. After completing this work test the wheels of the car for alignment and any error existing can usually be corrected by lengthening or shortening the tierod. Observe the gather of the front wheels and correct if too much or too little. It is a good plan to test

Showing a Longitudinal Sectional View of Roller Type Front Wheel Bearings and Components Used in Adjusting. Roller Bearings Must Be Adjusted Carefully Else Damage Will Result.

the alignment of the wheels at least once a month, as wheels out of true quickly destroy tires.

Clean and Lubricate Springs.



The springs should either be entirely disassembled or the leaves spread apart for cleaning and lubrication. A mixture of graphite and oil, forming a thick paste, is excellent for springs, and the same material can be successfully employed on the tire rims, which should first be cleaned. Worn spring bolts and hangers should be replaced with new when

Digitized by Google

considerable play exists, and all spring clips set up snug. The rivets of the frame and its cross members should be inspected and the nuts and bolts retaining the fender irons and running boards gone over with the wrench, as one or more loose parts may be the cause of that annoying squeak.

Checking Valve and Ignition Timing.

After any car has been in service for some time it is advisable to remove carbon deposits, reseat the valves and check the timing of the valves. This work can be performed by the owner, and as the flywheel of the engine is generally marked it is not a difficult matter to adjust the valves so as to obtain maximum efficiency from the power plant. Irrespective of the type of ignition system employed, whether it be the battery, timer and coil, the timer-distributor or magneto, the components of the system should be cleaned, adjusted and lubricated. The contact points of the breaker mechanism of the magneto and of the late types of battery ignition, must be clean and true to obtain good results, and the gap should conform to the dimension given by the maker. It is equally important that the gap

Phantom View Illustrating Rear Wheel, Differential and Pinion Shaft Bearings, Components Requiring Careful Cleaning and Adjusting. It Is a Good Plan to Clean Differential Case and Refill with Fresh Lubricant.

of the spark plugs does not exceed that specified and that each plug of the set have the same gap. Guesswork in the shape of dimes, cards, etc., should be avoided. Use a gauge if results are desired.

Lighting and Starting System.

Relative to the starting and lighting system the writer goes on record as opposed to the owner attempting to do other than strictly follow the directions of the maker. The average lighting and starting system includes the ignition, and to correct other than minor troubles is inviting trouble and expense. The methods of controlling the output of the generator vary and when these be at fault they should not be tampered with by the owner but by the service station expert or a repairman who has had factory instruction. The writer's contention is borne out by an investigation of the subject, and as a rule the owner is more likely to add to his troubles than to remedy the original one. The starting and lighting equipment is not as yet perfect and until it is more foolproof owners will avoid the possibility of trouble if they do not tamper with their equipment.

Care of the Battery.

Inasmuch as the slight or thorough overhaul will take a few days at least, it will afford an excellent opportunity to send the storage battery to the service station or expert for a careful inspection. It may be that the plates are slightly sulphated and require a long, slow charge, or that other slight repairs may be necessary. It is much better to do this than have the battery give you trouble some cold night when starting is not easy.

Cleaning the Carburetor.

After the overhaul comes the testing out on the road, but before trying out it is best to clean the fuel system. If the fuel filter be attached to the tank, empty and clean the former. Disconnect the fuel line from the tank to the carburetor and use compressed air to clean it. As to the carburetor, clean the float chamber, also the spraying nozzle, for the last-named is becoming a general offender. Tiny particles of dirt lodge in the nozzle and when they do the engine balks like a mule. If you clean the carburetor, do it thoroughly. And inasmuch as water will congeal in freezing weather, make it a practice to empty the filter and draw a little fuel from the float chamber at least once a week. If water gets into the float chamber and freezes it will afford one a very interesting time starting the engine.

Tools and Equipment.

No suggestions are given herein as to the tools required in the work of the overhaul. Ordinarily those accompanying the car supplemented by a few others will serve all practical purposes. If an arrangement be made with a repairman to assist in the work he will supply the special tools required, and it is advisable to mention this when obtaining his services. Overhauling one's car, either partially or wholly, not only eliminates a big repair bill, but affords the motorist experience that will be invaluable on the road.

Cause of Tread Wear.

Excessive tread wear can in almost every instance be traced to improper alignment of wheels, says the Goodyear Tire & Rubber Co. There are many minor accidents that force a wheel out of line. The car may be driven diagonally against the curb, or one wheel drop into a large rut with the opposite wheel unaffected, an axle, steering rod or knuckle may be bent or the demountable rims may be applied crooked—any of these produce abnormal tread wear, for they cause the tire to undergo a diagonal grind as it passes over the road surface. This grind wears off a tread just as surely as if it were applied to an emery wheel.

It is a wise procedure to check these points just as soon as premature tread wear begins to show. The cause is usually found in a few moments when searched for properly.

Gasoline Exports Increase.

One of the reasons for the high cost of fuel in this country is seen in the figures for gasoline exported during the seven months ending in June. During that period we shipped abroad 241,986,595 gallons, which compares with 198,147,553 for the same period in 1916.

SOLVING THE GARAGE PROBLEM.

How High Cost of Storing Car in Big City Is Avoided by Novel Plan.

BY C. S. PERRY.

Automobilists who move to New York City, particularly the class of salaried men or those wage earners who have incomes from $25 to $50 a week, are confronted by what is to them a serious problem when it comes to finding a place to store their machines. There are hundreds of garages on the

A Sample of the Individual Garage Where the Owner Can Tinker to His Heart's Content.

island of Manhattan, and it is not a lack of accommodations that bothers the out-of-town motorist locating in New York but the prices.

Law of Supply and Demand.

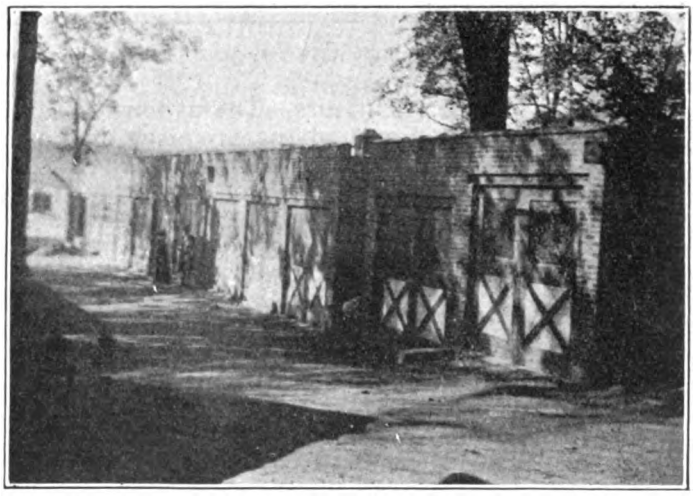
It costs from $35 to $75 and more to garage a motor car in New York. This seems to be an exorbitant price to the man who is used to small cities and places where $10 the month for live storage is considered a high charge. And in some cities live storage can be obtained for $5 the month. The reasons why prices are high in New York are numerous. In the first place sites for garages are not easily obtained, owing to restrictions; secondly, land comes high, and the garageman figures that he must obtain a good return on his investment to make a reasonable profit. What is, perhaps, the most reasonable explanation is that given by a garageman to the writer. Said the garageman, "My spaces are always occupied and any vacancies are in demand, so why should I not get my price?"

How Prices Affect Trade.

It is estimated by a conservative agent of pleasure cars that thousands of machines could be sold annually in New York to the salaried class referred to if there could be arranged garage spaces and at reasonable prices. Because there is a lack of space sales are lost to the trade. It is not the first cost of a machine that is figured by the prospect, it is the cost of garaging and maintenance. And those who figure these things become discouraged when they reckon that it will cost nearly the price of a popular make of car to garage it for one year.

How Problem Is Solved.

Among the efforts made to solve the garage problem for the motorist of moderate means is that of the individual garage which appears to have been successfully worked out by a couple of enterprising young men familiar with the requirements of the owner-motorist. These young men have leased a large tract of land in the vicinity of the Polo Grounds, the home of the noted Giants of the National Baseball League, and have erected approximately 60 individual garages on a plot of ground about 155x175 feet. As may be noted from the accompanying illustration there is ample space between the rows of buildings for one to handle a car, and room is a feature that attracts the woman motorist of which there are a large number at this place.



Fireproof Construction and Roomy.

The garages are of heavy sheet metal, of the angle frame type; that is, the roof and wind loads are carried on rolled steel trusses, columns, purlins, etc. The wooden doors are covered with metal, have wire glass panels affording plenty of light, and head and floor bolts hold the doors open when desired. Yale locks are used throughout. The windows are of wire glass and can be swung outward, and ventilators are included. Cement floors and good drainage are among the features. All buildings are electrically lighted and have sockets for plugging in a trouble or inspection lamp. There is ample room for a workbench, supplies and lockers, and a cement washstand near the entrance provides means for keeping the cars clean. Gasoline is sold at a reasonable profit as are supplies and equipment.

At the time this article was written consideration was being given to heating at a slight extra cost. All of these conveniences are obtained for $12 the month, and it is interesting to note that at least 40 per cent. of the tenants are new owners; that is, they are garaging their first motor car. The company operating the garages own another large group operated on a similar plan.

Another Garage Village.

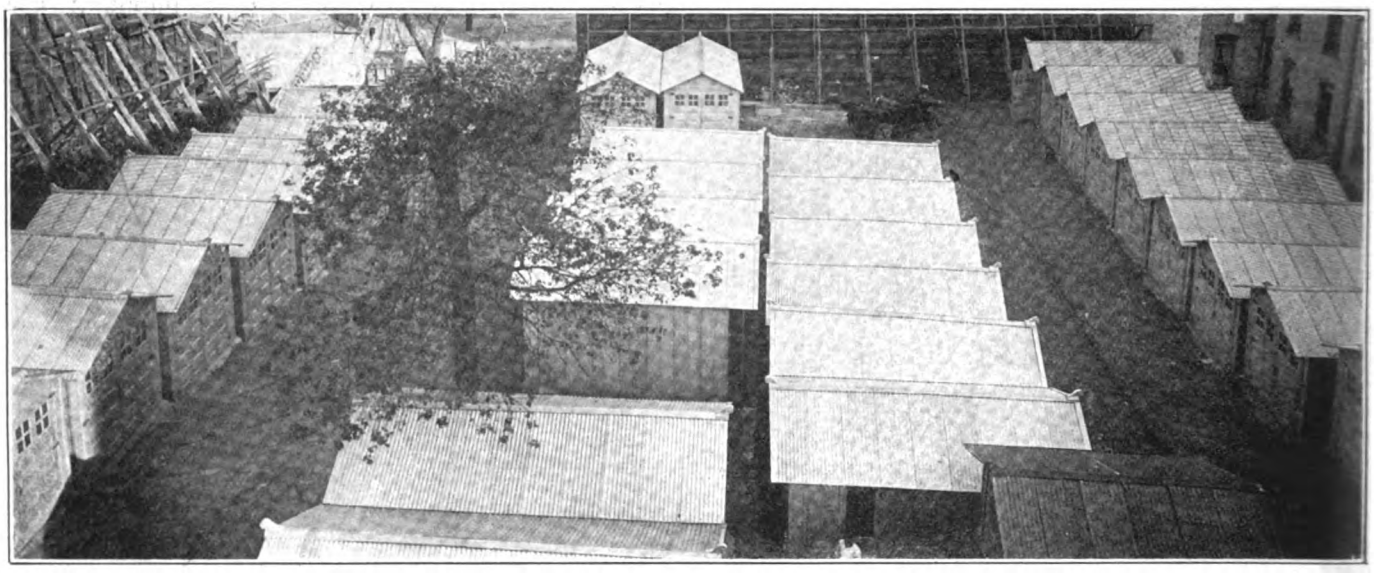
At the foot of a hill leading from Riverside Drive to the Hudson River, and well up town, is what is termed the Garage Village, so named because the

Some of the Individual Brick Garages of the Garage Colony. These Are Heated and Have Every Convenience.

75 or more garages are arranged much in the same manner as cottages in a country village. The rows of individual buildings run east and west or at right angles to the river, and standing at the entrance of each garage one obtains a splendid view of the Jersey shore and Hudson River.

Although but slightly over two years old the vil-

Digitized by Google



lage has grown steadily, and new structures are constantly in the process of building. These buildings represent different types; that is, different material. The first were of cement but these were followed with metal and now brick rules favorite.

Rentals Vary.

When the writer obtained the data for this article the buildings rented from $12 to $20 the month. The conveniences included running water, cement and drained floors, electricity, toilet, washroom, telephone, air compressor, etc. The brick structures are heated, and the services of an expert mechanic are available during the day. Fuel is sold at almost cost price, and supplies, etc., are carried by the proprietors of the garages. The dimensions vary, some being 10x16, 10x18 and 10x20. The space between each row is ample, being 30 feet. There is plenty of room to enter and leave.

Many Women Occupants.

It is interesting to note the number of the fair sex who are tenants, and who care for their cars. While the garages appeal particularly to the private owner, there are a number of cars garaged by owners who employ chauffeurs. These, however, are not allowed to loiter around the premises, nor are outsiders encouraged to visit the place. The cases cited demonstrate the possibilities for the man of moderate means obtaining space at a reasonable figure, but unfortunately the new building laws discourage the development of the individual and colony plan of garages. This is to be regretted for there are thousands of persons in New York who would invest in a machine were it not for the high cost of garaging. It is one of the penalties for living in the leading city of the country. But it is particularly hard on the automobilist who comes to New York from a place where garage rentals are reasonable.

Illustrating Some of the Individual Garages Located Near the Polo Grounds, New York. These Obtain Modern Conveniences at Reasonable Prices for the Owner of Moderate Means.

Points on Auto Insurance.

In discussing the different clauses in insurance policies, Charles C. Missall, automobile insurance specialist, says that "property damage coverage provides indemnity for the policyholder against loss by reason of his legal liability for the damage to or destruction up to the limit of $1,000 of any property on account of any accident due to the maintenance or use of the assured's automobile (excluding in any case the resultant loss of use of property so damaged or destroyed)."

Now, that clause "excluding the resultant loss of use of property so damaged or destroyed" means that while the insurance company will pay under the conditions of the policy for the actual damages caused by the assured's car the company will not pay for expenses incurred by the other party, for the hiring or renting of other vehicles, etc., while the damage to his property is undergoing repairs. For example: A physician's automobile is damaged by the assured's car to such an extent that while repairs are being made he is compelled to use a taxicab to make his professional calls in and includes that expense in his claim; that expense will not be assumed by the insurance company unless the property damage coverage is extended to include the resultant loss of use of the property so damaged or destroyed, by an additional charge of 25 per cent. of the property damaged premium.

Taking in consideration that the majority of automobiles are used for business purposes, it is advisable to provide for "loss of use" when taking property damage protection.

Draining the Cooling System.

Those owners who make it a practice to run the water from the radiator to avoid the possibility of freezing, will do well to make sure that every drop is removed. While the modern car is easily and effectively drained, there are some machines having pipes which are lower than the drain cocks. It is a good plan to study the system and make sure that it can be perfectly drained. This rule is more applicable to old models than the late ones.

Motor Cars Thick in Iowa.

The automobile business in Iowa is flourishing, a condition due to the fact that the farmers have had a successful season. There are 262,772 motor vehicles registered in the State, according to the figures given out by the Secretary of State.

Allot Space for New York Show.

At the regular October meeting of the National Automobile Chamber of Commerce, held in New York City, more than 100 automobile manufacturers discussed the new three per cent. tax on the industry imposed by the War Revenue Bill which became effective October 4. It being the intention of Congress in placing this tax that it be paid by the buyer of the car, it was the sense of the meeting that the amount of the tax should be added as a separate war item on each car and truck sold.

It was voted to subscribe $50,000 of the organization's funds in the second issue of the Liberty Loan, and also to carry bonds for employees of the association.

R. H. Collins, president of the Cadillac Motor Car Company, was elected a director to fill the vacancy caused by the resignation of Wilfred C. Leland, who has entered the aeronautical industry. There were reports from committees on traffic, good roads, commercial vehicle, and patents.

New members elected include the Barley Motor Car Co., Kalamazoo, Mich.; Elgin Motor Car Co., Chicago, Ill.; Republic Motor Truck Co., Alma, Mich.; G. A. Schacht Motor Truck Co., Cincinnati, O., and Stegeman Motor Car Co., Milwaukee, Wis.

New divisions of the chamber were voted upon, to be known as the passenger car division and motor truck division, to be headed by Vice-Presidents H. H. Rice for the passenger cars and Windsor T. White for the trucks. Charles Clifton presided at the meetings of the directors and members, which were attended by most of the presidents or executives of the leading companies of the industry.

S. A. Miles, the show manager, stated that with the addition of non-members who have applied, the number of car exhibitors will be greater than ever before, while the demand for the display of accessories and parts exceeds all previous records. The Motor and Accessory Manufacturers have applications to allot space to about one hundred of its members, and when the final allotment of accessory space is made the total will reach close to three hundred for each show.

The following makes as members of the National Automobile Chamber of Commerce were served at the first drawing for both shows: Gasoline—Abbott, Allen, Apperson, Auburn, Austin, Briscoe, Buick, Cadillac, Case, Chalmers, Chandler, Chevrolet, Cole, Columbia, Crow, Davis, Detroiter, Dodge, Dorris, Dort, Elgin, Elkhart, Empire, Fiat, Franklin, Grant, Glide, Hackett, Hal, Haynes, Hudson, Hupp, Interstate, Jackson, Jordan, King, Kissel, Kline, Lewis, Lexington, Liberty, Marion-Handley, Marmon, Maxwell, McFarlan, Mercer, Mitchell, Moline, Monroe, Moon, Nash, National, Oakland, Olds, Overland, Owen, Packard, Paige, Paterson, Peerless, Pierce-Arrow, Premier, Regal, Reo, Roamer, Saxon, Scripps, Standard, Stearns, Stephens, Studebaker, Stutz, Velie, Westcott, Willys and Winton; Electrics —Anderson, Baker, Milburn, Ohio and Wood. The Glide, Dorris, Hackett and Stephens will be shown at Chicago only, while the Kline will be exhibited at New York only.

Space was allotted to the following concerns, not members of the N. A. C. C.: American, Harroun, Monitor, and Stanley (steam). The American will exhibit at the New York show only, while the others will be at both shows. Allotment to other non-members will be made.

The number of exhibitors for both cars and accessories is greater than for any previous show and all the space on the four floors of Grand Central Palace and the Chicago exhibition buildings will be filled to overflowing. The New York show will be held the week of January 5 to 12, and the Chicago show from January 26 to February 2.

How Fords Have Multiplied.

Figures dealing with the Ford car are always of interest to owners. The annual report of the Ford Motor Co. for the fiscal year ending July 31, 1917, shows an increase of $26,754,560 in total assets and a reduction of $7,420,381 in the amount of cash on hand and in the banks. The total business transacted during the year is between $350,000,000 and $400,000,000 as compared with a gross business of $206,867,347 for the preceding year. The company produced 785,432 cars as against 533,291 for 1916. The schedule for 1918 calls for 900,000 machines and the company is now producing 2,700 a day and anticipates a production of 3,000 daily. The record number of cars for a single day during the year just closed was 3,310.

The production figures for the past 14 years are of interest and show how the Fords have multiplied. The figures follow:

Year	Cars Made and Sold	Increase or Decrease	Daily Average
1917	785,432	+ 251,511	2,618
1916	539,921	+ 255,708	1,816
1915	308,213	+ 59,906	1,027
1914	248,307	+ 83,855	827
1913	164,452	+ 95,908	545
1912	68,544	+ 30,078	228
1911	34,466	+ 15,802	115
1910	18,664	+ 8,057	62
1909	10,607	+ 3,209	35
1908	6,398	— 2,025	21
1907	8,423	+ 6,284	28
1906	1,599	— 96	5
1905	1,695	— 13	5
1903-4	1,708		

The Ford company has also changed its dealer policies and in place of making the usual one-year contract, as has always been done in the past, it is now making contracts with agencies which stipulate the yearly allotments but which may be terminated at any time.

Solves Shipping Problems.

A Louisville, Ky., automobile manufacturer has evolved a plan whereby freight congestion does not worry him. After the cars are completed and tested the demountable wheels and rims are displaced, flange wheels fitted and the cars sent to their destination under their own power in trains of 25 to 50 over the railroad rights of way. This presents possibilities of an interesting character.

Do not allow oily waste or greasy rags to accumulate about the garage. They are likely to create trouble in the way of fire and through spontaneous combustion. Sawdust soaked with oil will act in the same way. Either burn the rags or keep them in a can made for them.

FORECAST OF MOTOR FASHIONS.

What the Fair Sex Will Wear When Motoring—New Garments Simple in Style.

BY MRS. A. SHERMAN HITCHCOCK.

There are three things which the motor woman should strictly observe when buying clothing to wear in the car: practicability, serviceability an attractiveness. Time was when it was impossible to combine the three in motor raiment, but, since motoring has become an established manner of locomotion, all the noted designers and manufacturers have turned their attention to achieving something

The Kaptain Kid Motor Glove for Women. It Comes in Tan, Gray and Black, Is Soft and Pliable and Is Easily Folded.

in the sartorial line for women motorists that will be becoming and attractive, as well as protective. That they have succeeded admirably is clearly evidenced by the many extremely practical and decidedly modish garments built for motor wear.

One-Piece Dress Popular.

For general motoring during the colder season, the one-piece dress is deservedly very popular, Serge, Kashmere Kloth, Roshanara Crepe, Nanken, Velutina and the jersey cloths are the best materials for the motor frock, varied, of course, by those of silk—and there is nothing better and more modish than these attractive and durable frocks. There was a time, not so very long ago, when I should have hesitated to call silk or satin durable for motoring, but times have changed decidedly in this particular, and now that the Government has requisitioned such vast quantities of wool, and we are dependent to a large extent upon other materials, the manufacturers of silks have turned their attention to producing a product of durability and serviceability and the results show that they have succeeded in "doing their bit" in a most satisfying manner.

Frocks Plainly Made.

The new "slenderizing" Pussy Willow satin, the Satin Faced Poplins, Khaki-Kool, Indestructible Voile and Indestructible Crepe are ideal materials. Frocks are plainly made and show little trimming, a little hand embroidery or beading, or buttons, being about the only elaboration. Very straight and very narrow are the majority of frocks and the decided round neck and long sleeve are effectively used on motor frocks. An attempt to put newness into the popular sraight line is being introduced by an arrangement of back looped or side drapery which changes the slim outline to the bustle silhouette but it is too early yet to predict its success or failure, although I am very doubtful if women will take kindly to such an innovation.

Coats Are Simple in Style.

There is really no especial style that is followed in motor coats, to the exclusion of all others. Some of the new fall and winter models are so simple that they become distinctive by their very simplicity, while others are as dressy as it is possible for the expert to fashion them, without wholly transgressing the laws governing motor raiment.

The motor coats are to be long and fairly loose, and reach almost, if not entirely, to the hem of the gown. The heavy fur coats will do duty when upon the road and especially a little later, and are indispensable for winter touring. The Pontine coats are also garments of utility, but the cloth coats are most conspicuous at this season, and the Velours, Pom Poms, Bolivias, Broadcloths, Tweeds, Burellas and Duvatyns in the handsomest of plain colors, will prevail with the best dressed motorists. In many of the coats the figure or waistline is outlined by the introduction of panels, shields, surplice crossings and bolero effects. White Worumbo wools in the most lovely of quality is one of the newest and best-liked ideas for smart motor coats for city wear. They make up in garments of decidedly chic appearance, and the best part of these wools is that they can be cleaned with the greatest satisfaction and look perfectly new after each cleaning.

Sleeve Styles Change.

There are decided reminiscences of the dolman effect to be seen on some of the most attractive wraps for motoring. Sleeves that start almost at the hem of the garment and ripple their way to the shoulder line are among the newest models, and the

Illustrating Latest Motoring Fashion: At Left, Motoring Coat of Wool, a Smart Model of Worumbo Polly in New Furlough Red. Center, A Squirrel Fur and Moon-glo Satin by J. C. Stratton Co. Right, Goldflex, a New and Durable, Warm, Light Material.

arm size is a perfectly huge opening in the majority of these designs. This makes the wrap one of perfect comfort, and especially when the sweater is worn underneath. Kimono sleeves, sling sleeves, cape sleeves, and dolman sleeves are some of the designations that bring to the mind's eye the class

Digitized by Google

of arm coverings that are seen on advance models, as well as the regulation coat sleeve, which is always in good taste and in the mode.

Linings Are Artistic.

The linings of coats are so artistic and unusual that to see them is to long for them, and one motor woman expressed her delight to me in the following words: "The lining in my new motor coat is so beautiful that I really want to turn the coat inside out and wear the lining where it may be seen." The lining in question was a wonderful design in the Pussy Willow Silk of a most unusually realistic rose in its natural lovely shades of pink, against a dark blue background. These Pussy Willows, as well as the Zodiac Pussy Willows, and the Indestructible Crepe, are the favorite coat and fur linings for the season. The color combinations in these fabrics are as unusual as the designs and combined in striking and artistic blendings.

Rainproof Garments.

The motor wardrobe should contain at least one Raynster. These garments combine smartness and utility, and give ample protection from wind and rain. They come in Repps, Cashmeres, Tweeds, Fancy Mixtures, Honeycomb Weaves and many others.

There is more variety than usual this fall in the sweaters, and many attractive designs are shown. The pull-on sweater continues its popularity and especially adapts itself to the slender figure. The long, loose coat sweater, shaped much like a man's overcoat and supplied with numerous patch pockets, is a decidedly comfortable and practical garment. Angora and Shetland sweaters are particularly well liked, and there are also the silk, fibre and the silk or wool jersey.

Favor Turbans.

When it comes to headgear, the motor woman laughs the weather to scorn. The turbans which sit well over the head and hug the head closely are the most approved type of hat for motoring. A veil can be easily adjusted over this style of hat, and makes it so secure that the strongest winds cannot dislodge it. The turbans are very high-crowned this season and there is very little trimming. There are some lovely motor hats of the softest velour in charming colors in the mushroom style, and little shirred toques of velvet, fur, and the very fashionable Roshanara Crepe. Some of the motor hats take on a very military air and when this is not too obvious it is very smart. Smart motor hats are also made of bure and duvetyn, while there are very many felt hats; felt, however, is apt to be just a little heavy for motor wear, and velvet, while always attractive, possesses the same objection. Lightness of weight is one of the chief requisites in motoring millinery.

No Change in Veil Styles.

Veils have not changed much from those exploited for the summer wear. The chief requisite for motoring—and especially for touring—is a thick, heavy veil, that will keep out the dust and protect the face from the biting winds. The veils of chiffon cloth are always to be recommended for utility. The Po-Lo and the Koo-Koo are two stunning new veils which come in a vast number of lovely colorings.

Gauntlet Gloves Popular.

Gloves of buckskin, mocha and capeskin come for the motor woman, and are equipped with long gauntlets, in some cases extending nearly to the elbow. Some of the best gloves brought to my notice are the Kaptain Kid, Pirate, Sportif, and Air Pilot, all gloves made of the finest quality and many equipped with double weight knit lining which may be taken out and washed. The Kaptain Kid, shown herewith, comes in tan and gray, with or without the knit lining and is a splendid glove, being very smart and attractive on the hand and also most comfortable and very durable.

Shoes Now Lined.

The shoemaker also recognizes the requirements of the motor-lover. High-laced boots for motor

Illustrating Latest Motoring Fashions: At Left, the Palmer Model in Green Velour with Trimmings of Mole. Center, The La Jerz Blue Militaire Frock Ornamented in Chinese Embroidery. Right, Gray Blue Burella Cloth Trimmed in Military Style.

wear come with linings of fleece-down, fine cotton, flannel and silk flannel. The regulation motor boot, with its fur lining, which is a really splendid accessory to the motor wardrobe, is high in popularity. These boots, however, are intended to be slipped on over the kid shoe or slipper, while the new lined boot, mentioned above, fits directly to the foot, affording much warmth and comfort.

The very newest is the Pettibockers. They are really a bloomer made of the Vanity Fair silk, with which nearly all motor women are familiar. The Pettibockers are considerably fuller than the average bloomer, which really gives them the appearance of a skirt. At the bottom they are equipped with a wide frill and underneath the frill is a rubber band which makes them close around the ankle, thus offering protection from cold and wind. They may be had in nearly all the standard colors as well as pink and white. They have been designed wholly for the use of the motorist. The Vanity Fair silk garments wear wonderfully and are always delightful to wear. They may be laundered very easily and present an appearance exactly like new after repeated washings.

Breakage of bulbs is frequently caused by vibration. The filament is more or less susceptible to shocks, particularly when cold, and unless the lamps be braced they are likely to communicate the shock to the bulbs. Any blacksmith can make and fit a brace and the job will not be expensive.

HEADLIGHTS LAWS DISAGREE.

Lack of Uniformity Emphasizes the Need of a National, Universal Law.

The subject of headlight regulation; that is, the elimination of glare, is of interest to the motorists throughout the country. In their endeavor to formulate laws to prevent blinding of an approaching driver or pedestrian by the brilliant light, the legislators have enacted laws which make it practically impossible for any automobile manufacturer to comply with them; that is, without utilizing devices invented and marketed to prevent glaring.

The manufacturers recently requested the National Automobile Chamber of Commerce to digest the regulations relating to headlights in force or those to become effective on January 1 so that they could use equipment meeting all requirements.

An analysis of the laws compiled by the National Automobile Chamber of Commerce, and which is presented herewith, shows a marked need of having enacted a national law that will not only replace the conflicting State laws but will be universal. In analyzing the laws it will be noted that a number of States have adopted the suggestion of the S. A. E. and stipulate that the beam of the reflected light from the headlights shall not rise over 42 inches above the level of the surface of the road on which the car stands, unless the lamps are equipped with lenses or other non-glaring devices. Others require a dimming device.

The distances the light shall be visible ahead and at 42 inches from the surface of the road also vary. There is also a difference of opinion as to what constitutes the proper use of the spot light. These differences are given in the digest herewith.

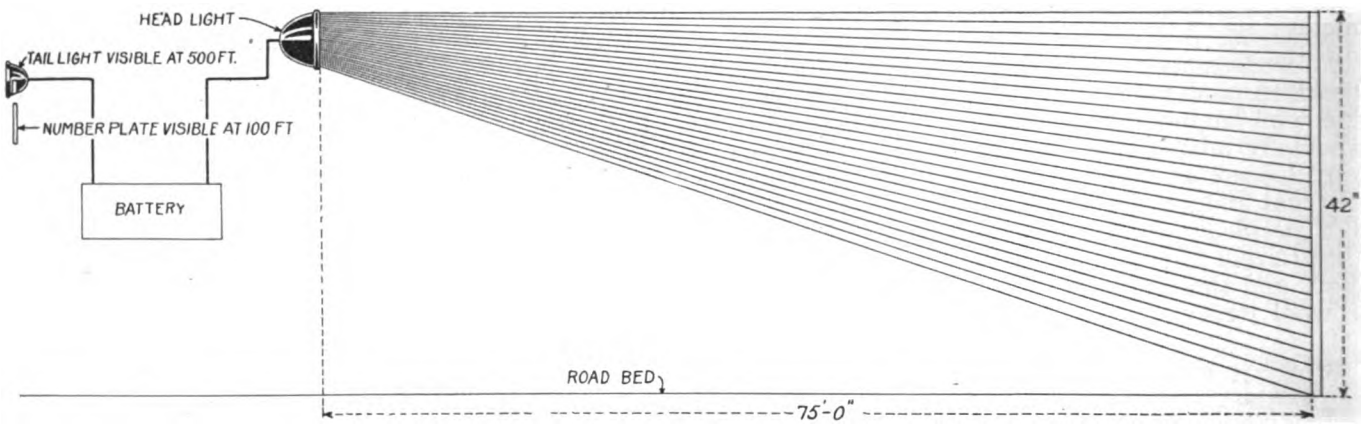

Diagram Illustrating the Regulation of Beams of Headlights in the Majority of States. The Sketch Suggests a Method of Testing the Lamps.

Front Lights.

Number—One or more—In Michigan, Nebraska, Virginia, West Virginia, Wisconsin, Wyoming.

Two or more—In Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Florida, Delaware, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Minnesota, Montana, Mississippi, Missouri, Nevada, New Hampshire, New Mexico, New Jersey, New York, North Carolina, North Dakota, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, Wisconsin.

Color.

White—In Arizona, Arkansas, Delaware, Colorado, District of Columbia, Georgia, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Montana, Mississippi, Nebraska, Nevada, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wyoming, Wisconsin.

White, amber or yellow—California, Denver (Colorado).

Not specified—In other States.

Position.

One on either side—In District of Columbia, North Dakota, Montana, Washington.

Visibility.

Reasonable distance in direction toward which vehicle is proceeding—In Arizona, Georgia, Nebraska, Nevada, Wisconsin.

Visible at least 100 feet—In Virginia.

Visible at least 200 feet—In Arkansas, Connecticut, Delaware, District of Columbia, Florida, Idaho, Illinois, Indiana, Kentucky, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Montana, New Hampshire, New York, Ohio, Oregon, Pennsylvania, Rhode Island, Vermont, Washington.

Visible at least 250 feet—New Jersey, Utah.

Visible at least 300 feet—Denver (Colorado), Kansas.

Visible at least 500 feet—California, Iowa, Missouri, Texas, Wyoming.

Illumination.

Sufficient to reveal any person, vehicle or substantial object on the road 150 feet ahead—In California, Connecticut, Denver (Colorado), Indiana, Massachusetts, Missouri, Utah.

200 feet ahead—In Louisiana.

250 feet ahead—In New York.

10 feet to side of road 10 feet ahead of lamps—In California, Connecticut, Massachusetts, New York, Utah.

Candlepower.

Gas lights must not exceed 21 candlepower—In Delaware.

Electric lights must not exceed 24 candlepower—In Delaware.

Any light must not exceed 30 candlepower—In Maryland.

Not exceed 36 candlepower—In Missouri.

Beam of Light.

Parallel, focalized rays, from lamp of more than 4 candlepower, gathered and projected by a reflec-

Digitized by Google

tor, lens or other device, must not rise more than 42 inches above level surface of road on which vehicle stands, under all conditions of load, at a distance of 75 feet or more ahead of lamps—In California, Connecticut, Denver (Colorado), Iowa, Maine, Missouri, Nebraska, Nevada, New Jersey, New York, North Carolina, North Dakota, Ohio, Oregon, Utah, Vermont, Washington.

50 feet ahead—In Massachusetts.

4 feet above level of road—In Florida, Texas.

Dimming Devices.

Headlights must be dimmed or shaded, or rays diffused to prevent glare, by some coating or other device—In Delaware, Florida, Chicago (Illinois), Indiana, Kansas, Maine, Michigan, Missouri, Nevada, New Hampshire, New Jersey, Ohio, Oregon, South Dakota, Texas, Wyoming.

Dimming Device Controlled.—Dimming devices must be capable of being operated at will of driver—In Illinois and Michigan.

Must not be capable of being operated from driver's seat if lamp can project direct rays more than 4½ feet above road—In New Jersey.

Devices Approved.—Headlights, dimming devices, lenses, etc., must be approved—In New Jersey and New Hampshire by Commissioner of Motor Vehicles; in Chicago by Board of Motor Vehicle Light Inspection; in District of Columbia by Commissioners of District.

Regulations Delegated.—Headlight regulations must or may be promulgated—In Maine by Public Utilities Commission; in Rhode Island by State Board of Public Roads.

Inspection Tag.—Manufacturer, distributor or wholesaler of automobiles may affix a tag upon lighting equipment showing same has been inspected and approved—In Chicago.

Spot Light or Searchlight.

Position.—Must be mounted on left side—In Delaware.

Deflection of Beam.—Must be deflected so beam will not rise more than 42 inches above road—In California, Denver (Colorado), Connecticut, Iowa, New York, North Carolina, North Dakota, Ohio, Oregon, Utah, Vermont, Washington.

More than 4 feet above road—In Florida, Texas.

Dimmers.—Must be equipped with dimming device—In District of Columbia, Indiana, Kansas, Michigan, Nevada, New Hampshire, South Dakota, Wyoming.

Use of Spot Light.—Must not be used as permanent headlight or for driving—In Delaware, Maine, New Jersey.

Light must not be thrown in face of approaching driver—In Connecticut, Iowa, Kansas, Maine, Michigan, Nevada, New Hampshire, Ohio, Vermont, Washington.

Must be used only in emergency and for rounding turns—In Wyoming.

Only for reading signs and house numbers—In New Jersey.

Only in emergency in cities and towns—In Missouri.

Only in accidents, reading signs and numbers and examining edge of road—In Delaware.

Only when car is stationary, in reverse or at slow speed—In Maine.

Must be directed down—In Missouri.

Must be projected directly upon road not exceeding 10 feet ahead of car—In Delaware.

Not exceeding 30 feet—In Nebraska, North Dakota, Utah.

Not exceeding 50 feet—In Indiana, Ohio.

Not exceeding 30 feet when approaching other vehicles—In Connecticut, Vermont.

Not exceeding 60 feet when approaching other vehicles—In Ohio.

Sale Prohibited.—Must not sell, offer for sale or have in possession with intent to sell, any vehicle equipped with lighting device of over 4 candlepower with reflector, unless same complies with special lighting law—In Denver, Chicago, Washington (State).

Rear Lights.

Number.—One—In all States.

Position.—Left side—In District of Columbia (not specified in others).

Color.—Red—In most States (not specified in some).

Visibility.—Red light must be visible from rear not less than 200 feet—In Rhode Island.

Not less than 300 feet—In Colorado.

Not less than 500 feet—In California, Missouri, Texas.

Visibity of Number (on license plate).—Not less than 50 feet—In Alabama, California, Iowa, North Carolina, New Hampshire, New Jersey, New York, Vermont, Wyoming.

Not less than 60 feet—In Connecticut, Rhode Island, Washington.

Not less than 100 feet—In Idaho, Indiana, Montana, Nebraska.

Not less than 150 feet—In Illinois.

Independent.—Must be independent of other lights and capable of being lighted or extinguished only when vehicle is stationary—In Indiana.

New Plan to Foil Thieves.

It is not unlikely that the automobile thief of the future will arm himself with a large magnifying glass instead of the pliers and jimmy, for a new method of catching the purloiner of motor cars has been tried out and proven a success. It consists of each owner placing private identification marks on the different components of the machine. If the car be stolen and even broken up and the parts scattered, it is possible for the owner to aid the authorities in identifying the parts by means of the private marks. This results in the detection of the thief. The system worked out nicely in Detroit, where a Ford car was traced through a number of hands to the junk pile by means of marks known to the owner only. A conviction was easily secured of the guilty parties. So if one sees a party examining a radiator, magneto, carburetor or other component of a car with a magnifying glass, says Automobile Topics, it may be assumed that the vehicle is protected by identification marks.

New Massachusetts Registration Marks.

Massachusetts has established new registration figures which reflects the prosperous condition of the country and the increasing demand for automobiles. The number of vehicles registered in July and August was seven times greater than the increase for the first half of 1917 showed over all of 1916. The figures show that the increase in the two months mentioned was 15,451 passenger cars and 2,051 commercial vehicles. Up to September 1 there were 136,238 vehicles registered.

Automobile Dealer and Repairer

A Magazine of condensed and compact information for busy readers.

Member of the Audit Bureau of Circulations.

Member of the Associated Business Papers.

PUBLISHED THE MIDDLE OF EACH MONTH BY

THE MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, New York

Telephone, {7377 / 7378} Barclay — Post Office Box 654

CHICAGO OFFICE, 608 SOUTH DEARBORN STREET

Entered as second-class matter at the Post Office in New York City.

M. T. RICHARDSON, President and Treasurer — F. R. WHITTEN, Secretary

F. R. WHITTEN, Advertising Manager

F. M. DAMPMAN, Eastern Representative — H. F. LUDINGTON, Western Representative

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Foreign Subscriptions ..... $1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK OCTOBER, 1917.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

LARGE INCREASE IN ACCIDENTS.

The Police Department of New York has kept a careful record of the street car and automobile accidents in the city for the past year, as it always does. It appears that in the month of August, 1916, 559 people in this city were struck by automobiles. In the month of August, 1917, 716 people were struck by automobiles. During the same period in 1916 171 people were struck by motor trucks, and in August, 1917, 236 people were struck by motor trucks.

The above shows a large increase in accidents by motor vehicles. This may be in some degree accounted for by the increased use of automobiles and trucks, and, to some extent, of course, by the more or less reckless acts of the pedestrians themselves. Familiarity with motor vehicles, of course, naturally induces less exercise of care than ordinarily is shown. People take more chances than they used to, with the result that a great number of them are injured. Drivers themselves exercise less care than they used to, probably. They push ahead, sometimes, in crowded streets, where they ought not to, taking it for granted that the pedestrian will skip out of the way—but he doesn't always do it.

In an automobile trip through the White Mountains this summer, over the excellent but crooked New Hampshire roads, the writer could not fail to note the numerous instances of more or less reckless, or at least careless, driving. Curves are numerous on this route, and the driver of the car in which the writer rode never failed to sound his horn on approaching a curve, but in not a single instance during this trip was this precaution taken by cars which were met; and some of them were guilty of cutting corners, with the result of several close shaves, during a ride of several hours.

THE NEW LIBERTY LOAN.

We wish to make a personal appeal to every reader of this magazine with reference to the second Liberty Loan.

Subscriptions for this new loan will close October 27 and we hope that any of our subscribers, who have not already purchased a Liberty Bond, will surely do so before the closing date.

These bonds bear interest at the rate of four per cent. per annum, and they are also convertible into any later issue which may be brought out by the Government during the present war, at a higher rate of interest, thus making an ideal investment for your savings.

It is the patriotic duty of every loyal American citizen, without regard to his political opinions, to "Do his bit" by taking as large a block of these bonds as his financial circumstances will permit. Enormous expenses will be involved in the prosecution of the great war. Remember that the nation's need is your opportunity. If you cannot fight, your money can. You can buy a Liberty Bond from any bank, trust company or reputable brokerage house in the United States. Banks have made arrangements by which these bonds can be purchased on the easiest possible terms, even to the extent of only paying $1.00 down.

There are only a few days more in which to fulfill your patriotic duty in this matter. Buy a Liberty Bond!

MOTOR TRUCKS AND DEALERS.

Despite the fact that an enlargement of capacity of nearly 800,000 freight cars has been added without purchasing new equipment, the freight car shortage still continues. This has been largely due to the withdrawing of cars and equipment for government use in moving supplies for the army camps and to the seaboard for shipment abroad. That the transportation problem is becoming more complex is admitted by those who have made a careful study of conditions. The only relief available is the motor truck or commercial car for haulage in short as well as long distances. The commercial car industry has anticipated the present conditions and is well prepared for the emergency. It is now up to the dealer to study local transportation conditions and to show the manufacturer and merchant how trucks can be profitably and economically operated. The present and future affords the established dealer a great opportunity. Those contemplating the taking over of an agency for commercial cars cannot choose a more appropriate time.

OVERHAULING THE CAR FOR WINTER.

This is the season of the year when the thoughtful motorist will consider the preparing of his car for fall and winter service. After continuous service the average machine will require more or less attention to place it in first-class condition. The work may not involve other than the removal of carbon, the grinding in of the valves and minor adjustments. On the other hand, the overhaul may be very thor-

Digitized by Google

ough. General instructions for accomplishing the work are given in this issue and include suggestions for the new owner. Those desiring detailed advice as to how best accomplish the work, the adjustment or overhaul of any particular component, should address the editor of the technical department. Any and all questions will be answered promptly.

AUTOMOBILES AND THE NEW TAX BILL.

Most of our readers undoubtedly have been waiting to see what Congress would do in the way of levying a tax upon automobiles.

The new War Tax Bill as it came from the hands of the Conference Committee places a tax of three per cent. upon all automobiles, automobile trucks, automobile wagons and motorcycles. Manufacturers of motor vehicles are permitted to deduct an amount equivalent to five per cent. of the amount paid for the tires, including inner tubes.

Practically all automobiles, if this measure becomes a law, will hereafter cost $30 on every thousand dollars in excess of what they cost before, because the car manufacturer must either pass along the exact amount of the tax to the purchaser or raise the price to a point which will cover the tax.

The increase in the cost of material has already made it necessary for some manufacturers to raise prices, and others doubtless in due time will follow suit. So that whether the manufacturer demands the exact amount of the tax or not, he will get it in his new schedule of prices.

WINTER EQUIPMENT.

October opens the fall and winter season and there is every reason to believe that the dealer, garageman and repairman stocking suitable equipment and supplies will enjoy unusually good business. The selection of the stock requires careful consideration as well as a study of the requirements of the prospective customers. There are always certain standard supplies and equipment which are always in demand and salable, but the progressive dealer will study the merits of the new devices brought out and thus anticipate the wants of his customers. Advance information of those articles which make for comfort and convenience as well as economy in motoring, is contained in this number and should be well studied by the dealer, repairman and garageman.

CREDIT WHERE CREDIT IS DUE.

A concern which does a large and successful mail order business—all done by advertising—has been trying to figure out the percentage of results from advertisements in different publications. An elaborate series of experiments has demonstrated that it is possible to trace less than fifty per cent. of sales made to any given medium. This concern has adopted the plan of multiplying all traceable inquiries by two, as giving to each publication the fairest credit for results obtained.

NON-GLARING LIGHT DEVICES.

The attempt of the legislators of the various States to safeguard the users of the highways by enacting laws to control the use of headlights and spotlights on motor vehicles has resulted in a conglomeration of laws which work a decided hardship to the car manufacturer, to say nothing about the owner. What is legal in one State is illegal in another. Devices recognized in one State are taboo in another. Under these conditions it is impossible for the automobile manufacturer to produce or equip his product with a non-glaring device that will conform to the laws of every State. The case illustrates and forcibly too the need of government regulation, of the enactment of a universal law or laws.

TROUBLE DEPARTMENT.

Owing to an unusual number of letters from readers desiring information as to the care, maintenance and repair of their machines, a number of replies have been held over until the November issue. Relative to the Trouble Department, we suggest that readers wishing an answer by mail so state in their letters. When this is done a reply will be made on the same day the letter is received. Once again we would request that when information is desired as to a certain component of the car, a magneto or generator, for example, that the make, model and year be given.

WASTING THE FUEL SUPPLY.

Economy of gasoline does not mean restricting the intelligent use of motor vehicles, but rather the stopping of the various leaks. If the fuel wasted through leaking and flooding carburetors, by passing out unburned in the exhaust, or by use of too rich a mixture, and by operating the engine when the car is idle, could be measured the figures would be amazing. There is no doubt but what millions of gallons of gasoline are wasted in the manner above described. Let us all begin to practice as well as preach fuel economy.

A NEW FEATURE.

A new feature presented to our readers in this issue is an article on motoring apparel for the woman who motors. It is compiled by a well-known writer, is well illustrated, and gives advance information as to what is to be worn this winter. We will appreciate an expression from our readers as to the desirability of making these articles a permanent feature.

INSPECT YOUR INSURANCE POLICIES.

A correspondent of The New York Times sounds a note of warning to all who are carrying automobile theft insurance. He says if a car is stolen by a chauffeur, or other employe, no insurance can be collected. Very few car owners are aware, probably, that their policies contain an exemption clause of this character.

Makes Driving Safe.

Two measures for making driving safe have been adopted by Hull, Mass., which is nearby to Nantasket Beach. At one point where there is a dangerous right angle turn with a telephone pole that has caused many accidents the authorities have painted the pole white from top to bottom. At another point where the traffic officer was not always easily seen because of being placed in a shadow, there has been placed a searchlight for signalling.

CUSTOM MADE BODIES.

Why the Made to Order Enclosed Body is Increasing in Favor.

DESIGNED BY R. G. WILLIAMS.

Despite the fact that the manufacturer of the stock body offers many beautiful designs with richly upholstered interiors, there is an increasing demand for the custom made body. The custom made body is favored by those whose pocketbooks permit for the reason the designer can incorporate in it the personal ideas of the customer. It is not an easy matter to please the particular discriminating motorist, particularly when it comes to the arrangement of the height and depth of the seats, etc. Then again there is the back cushion to be considered and its fit to the customer is an important factor.

Details of Design.

Probably the most popular type of body is the town or enclosed design which is offered in many types. One of the difficulties in designing a body of this character is the treatment of the driver's seat and its entrance. The tendency is to set the driver distinctly apart from the passengers, yet at the same time the flowing lines of the entire design, from radiator to the rear spring, should not be broken to any great extent. The solving of the driver's seat is not an easy one and very frequently the result of the designer's work is, at the best, a compromise.

Comfort is Considered.

Considerable more attention is being paid toward providing the driver with comfort, and the latest practice is to line the under side of the carpet in driver's compartment with asbestos so as to exclude the heat in mild weather. The tendency toward protecting the driver from the weather is also more noticeable than formerly.

Weight Is Undesirable.

The enclosed body designer is making noticeable progress toward a lighter construction, and the old, heavy type of limousine which is death to tires is no longer favored. Fuel economy is desired even by those of means.

The enclosed design shown on the opposite page is of the limousine type, and has several advantages over the stock construction. The design is for attachment to a 1917 Studebaker six-cylinder chassis which has a wheelbase of 122 inches. One of the advantages of the design is that the front and rear fenders and hood do not have to be altered to conform to the flowing lines.

Construction Is Cheaper.

The body is considerably lighter than the stock design of similar type and the framing construction is cheaper. Inasmuch as it is what is termed a straight side body the framing can be mortised and formed together in much faster time than the construction including the curved sides. While the roof is practically flat the straight line effect is relieved by the graceful curves at the sides, front and rear, the last named being particularly attractive and pleasing to the eye. The elimination of bending roof bows should make this design an economical one to produce.

Seating Arrangements.

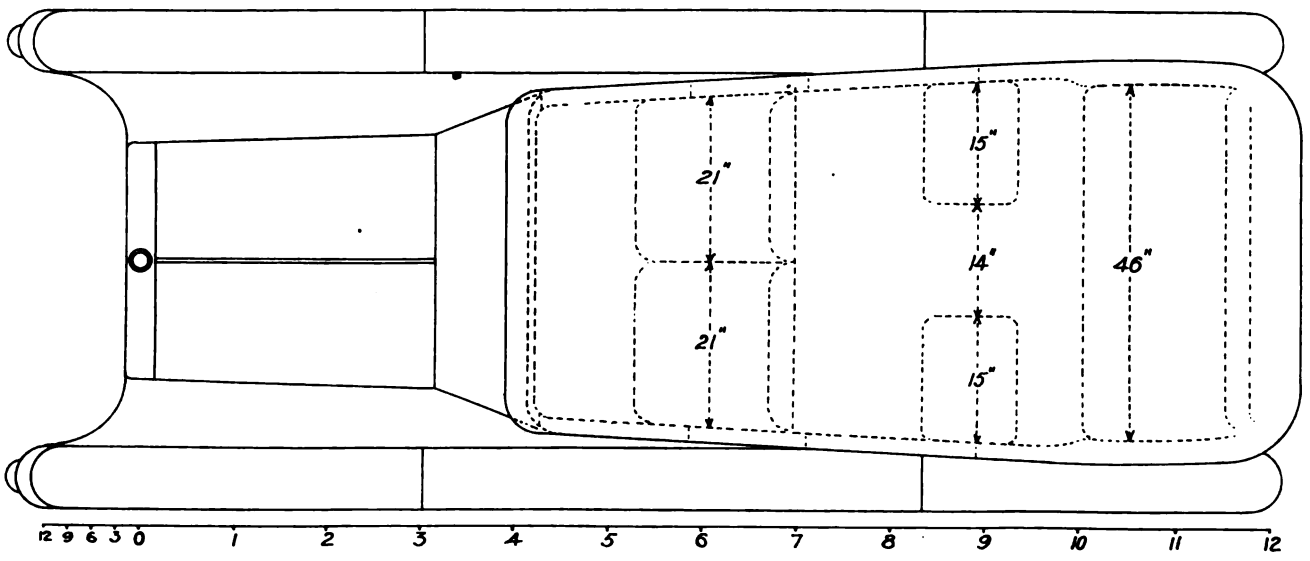
The seating arrangement has been carefully worked out and provides comfort with plenty of room for the passengers. There is ample space between the back of the front seat and the front of the rear seat, and even the use of the auxiliary seats does not inconvenience the occupants of the rear seats as is evident from the dimensions given.

Ed. Note:—Complete details including working draft can be obtained by addressing R. G. Williams, care the editor of the Automobile Dealer and Repairer.

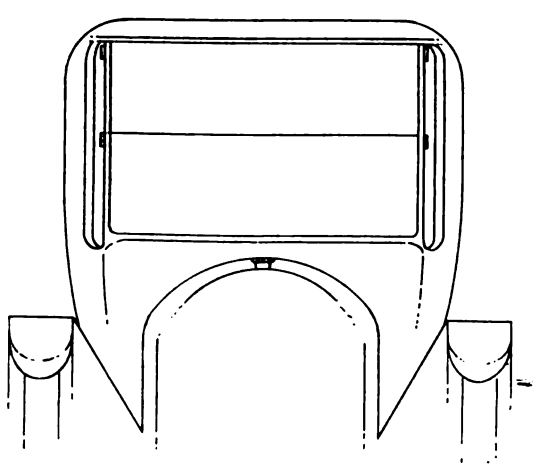
Autos Increasing in Hawaii.

So rapid has been the development of the automobile service in the Hawaiian Islands, with the addition of many new machines upon each island, that two large reinforced concrete garages and display rooms are being built in Honolulu. One is for the Von Ham-Young Co., and will cost about $52,000. This building will be 290 feet long, and will form practically the keystone of what is now known as "Automobile Row." Another extensive garage is being erected and will form practically the keystone of what is now known as Garage Co.

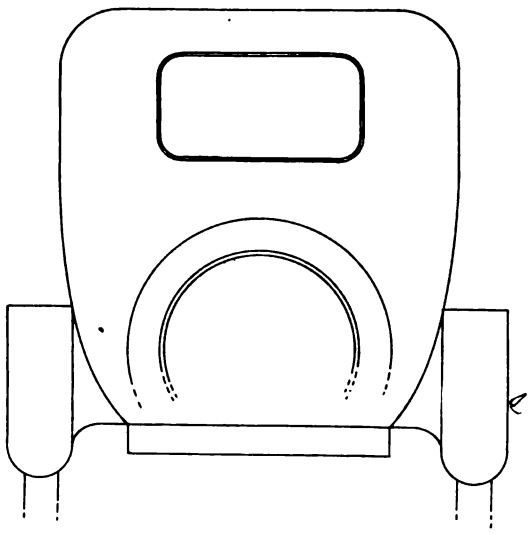
There are now registered in Honolulu (which includes the island of Oahu) 3,540 automobiles and 500 motorcycles. In Hilo, and including the island of Hawaii, there are 1,500 registered automobiles and 22 motorcycles. At Wailuku and throughout the island of Maui there are 700 registered automobiles and 20 motorcycles. On the island of Kauai are 600 registered automobiles and 30 registered motorcycles.



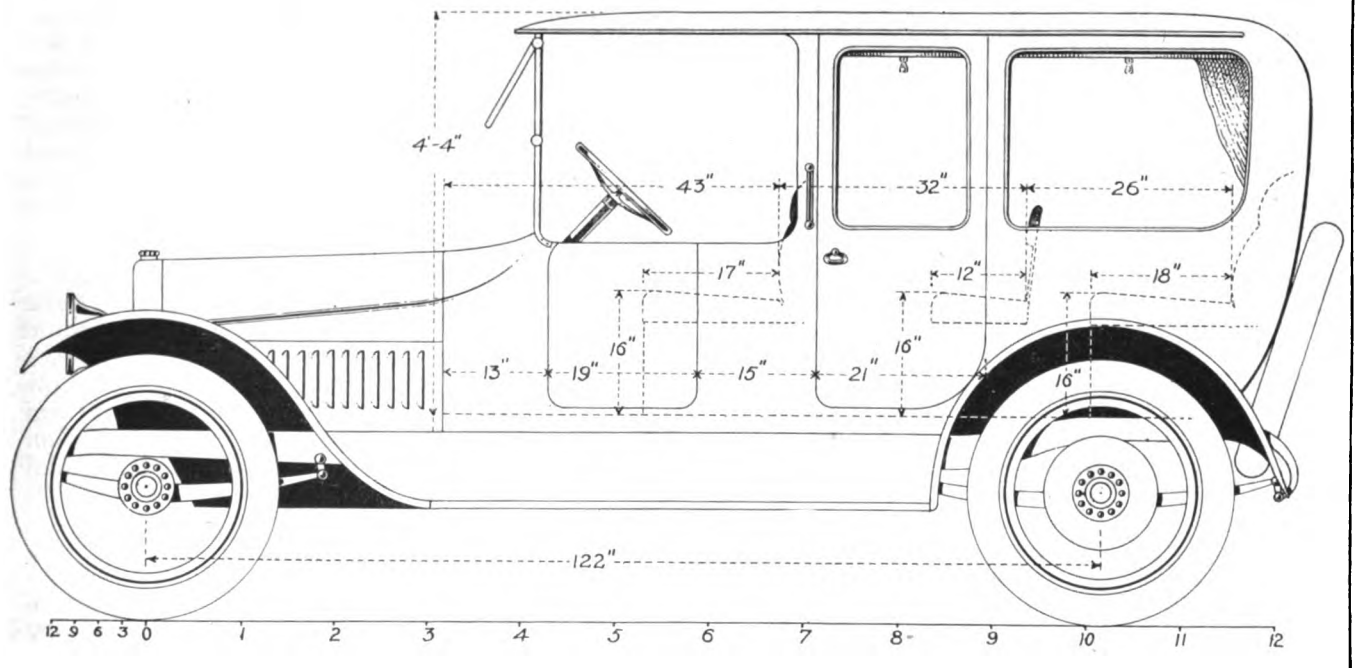
In Honolulu a corps of traffic policemen is maintained, embracing many of the former patrolmen, who have been transferred to the traffic squad. These are stationed at the intersections of streets in the business section from 8 a. m. to 6 p. m. There is also a motorcycle squad whose duties are to regulate traffic in the outer sections, and which has been instrumental in running down auto thieves. In Hilo there are no traffic police, but because the city has no street car tracks the highway intersections are provided with "silent policemen" or ornamental posts surmounted by electric globes, and motor cars always keep to the right of them.



The Territory of Hawaii has 850 miles of main public roads suitable for auto travel. The mileage was recently ascertained during a tour throughout the islands by a pilot car party which studied the roads and places of interest to visit on a ten weeks' tour. Scarcely an island hamlet or a fishing village in Hawaii is so small or remote that it is not accessible to autos.



Service stations are found throughout the territory, and there is not a small steamship landing or a village where an auto for hire cannot be found or obtained in a short time by a telephone call. The price also is so low as to astonish strangers. The territory has been inoculated with the "good roads" virus, and there are now in course of construction or to be constructed on the islands roads for which sums aggregating $2,500,000 have been appropriated during this year.



In installing new water pipes, rubber hose, do not tighten excessively at first. This will not stop any minute leak except temporarily and the rubber walls of the hose are apt to become broken. Tighten gradually and the leak will be cured.

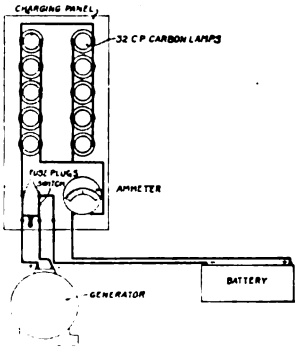
Illustrating and Giving Dimensions of Limousine Type of Town Car Body Mounted on 1917 Six-Cylinder Studebaker Chassis.

Digitized by Google

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.



Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2220 Charging Storage Battery.

From L. R. Hall, Michigan.—Can I charge a battery with a direct current generator, 32 volts, 11 to 35 amperes, and would you wire it up the same as shown in the drawing in the last issue? If not, please supply a drawing showing how to wire it.

Reply. — In charging storage batteries with a direct current there are several matters to be carefully considered. One should be careful to connect according to polarity, also to charge according to the directions of the maker of the battery. The chief point to be considered is the reducing of the charging current or rate to that required by the battery. This is accomplished under the conditions you refer to by placing resistance in the circuit. This resistance regulates the amperage of the current allowed to flow through the battery. It should be borne in mind that the internal resistance of a battery is very low and if it were coupled directly into a circuit without the interposition of additional resistance an excessive amount of current would flow through the battery and injure the plates. By using a bank of carbon lamps as shown herewith you can create the desired resistance. Standard carbon lamps of the voltage of the circuit are used. The resistance of a 32-candlepower carbon lamp on a 110-volt circuit is such that about one ampere of current will flow. Two 16-candlepower lamps may be used instead. It should be borne in mind that when the voltage is doubled the amperage is cut in half, therefore a 32-candlepower carbon lamp on a 220-volt circuit will pass but half an ampere. By varying the number of lamps in the bank the charging rate may be increased or decreased as desired and required by the battery maker. These facts should be understood before attempting the work. While battery charging is possible under the conditions named we believe that it will be more satisfactory to have the battery charged by an expert, particularly if the plates be sulphated and require special charging. Charging by the method suggested requires care, to say nothing of the work and expense involved in preparation for the work.

Utilizing Bank of Lamps for Resistance in Charging Storage Batteries.

2221 Several Questions.

From A. L. Scott, New York.—1—When does the patent on the sleeve valve engine expire? 2—After the expiration of the patent would the expense of manufacturing the engine be so great as to prevent it from being universally adopted? 3—How much more internal friction has a sleeve valve motor than an ordinary poppet valve engine?

Reply.—1—This information can be obtained at the United States Patent Office. 2—No. 3—The friction is that of the sleeves.

2222 Another Case of Oil Trouble.

From Henry Lobeck, Missouri.—I have a 1916 Maxwell. The spark plugs, particularly the one in the third cylinder, fouls easily. It seems to be the oil working up. I am obliged to clean the plugs every 10 miles at times. I was told to put in patent piston rings and had it done but it did not cure the trouble. I was also told that it would take 100 miles running before the new rings would work to a fit. Have run the car 1,000 miles since putting in the rings but the plugs still foul. Can you tell me how to remedy it? Too much oil is the cause but I do not notice any improvement when the oil supply is low. And is there not danger in running with too little oil?

Reply.—If the new rings were properly fitted and have been run in, they should eliminate the trouble provided, however, that the cylinder is not scored or worn. Under the conditions mentioned we would suggest that you have an expert examine the cylinder at fault and it is very likely he will discover that the cylinder is out or that the rings were not properly fitted. The use of a heavier oil will help but a change in lubricant should not be made without consulting the agent or maker of the car. There is danger in operating with an insufficient supply of oil. Follow the instructions and keep the oil level as recommended.

2223 Is Losing Power.

From Lamar Van Syckel, New Jersey.—I have a 1917 Dodge Sedan car, bought the first of May; been run 1800 miles, at first without any trouble; could get it down to three miles per hour on high, in fact so low would not register; but of late, when below seven miles jerks. At the garage today they told me that two of the cylinders had no compression in them, on account of carbon being in them, and that I had to have them ground. I was also told it was on account of two of the spark plugs being defective; someone else told me that. I put in two new ones, and cleaned the other two, but with the results stated above. Can you advise me what the trouble is and how it can be remedied? I think they often tell you in the garage that it is carbon when it is not. When I removed the spark plugs I found

Digitized by Google

very little carbon. If I do not have the carbon removed and valves ground, would it do any harm to my car, or ruin the valves? I wish you would give me this information at once, thanking you in advance for same.

Reply.—The cause of your being unable to operate the car at low speeds, to throttle the engine down, can be due to mixture or to failure of the valves to seat properly or a combination of these troubles. It is a simple matter to determine whether or not the valves are seating by cranking the car by hand and noting the resistance. Of course, the better method would be to use a pressure gauge. If you find the compression poor it is advisable to have the valves reground as it is poor economy to run the car in this condition for any great length of time. The valves will not be ruined by operating the engine but it may result in a more expensive repair bill in that it may be necessary to reface the valves and their seats. To have the valves ground does not necessarily mean a large bill of expense.

2224 **Engine Overheats.**

From Henry Trolio, Mississippi.—Am driving a 1916 Velie model 22 and would like a little information on the following, if possible: With the engine idling it makes a noise as if the oil in the crank case was at a hard boil. With car running 25 or more miles per hour makes a knocking noise as if a loose bearing. With car running between 30 and 40 miles per hour for four or five miles, the water in radiator boils. Oil leaks past piston rings and out around the spark plugs. Using Mobiloil A Oil. Cylinders are not scored. What I have done to remedy the above without any success: Cleaned out carbon, ground valves, adjusted pushrods, tightened up all connecting rod and crank shaft bearings, put in new "Inland" piston rings, new set of timing gears, new connecting rod wrist pins, new inlet and outlet hose on radiator. And also a Hoosier Sub-carburetor, which I thought would help to keep the engine cool. Car has automatic spark control. Car has been run about 1,000 miles since new piston rings were put in. Spark control and carburetor are adjusted right. What is the probable cause of the noise, and what makes the water boil? Regarding the oil leaking, is Mobiloil A Oil a heavy enough oil for this motor? Could a slight play (¼ of an inch, about) back and forward of the crank shaft be the cause of the noise? My repair man says it shouldn't, as all motors are supposed to have this much play in the shaft. The play is not up and down, but from end to end. Any information will be appreciated.

Reply.—The noise referred to may be due to the compression escaping from the crankcase or to the air intake of the carburetor. It is difficult to state without inspecting the engine what is the exact cause. The fact that oil leaks past the rings would indicate crankcase compression. The knocking may be due to a number of causes, but if the bearings and other components of the engine are in good operating condition, the trouble is either due to incorrect timing of the spark or to an alteration of the timing of the engine. You state new timing gears were installed. The fact that the water boils indicates timing trouble as well as ignition and possibly mixture and circulation trouble. You should use the kind and grade recommended by the maker. The play in the crankshaft is too great as stated by the repairman. We would suggest that you check up the valve and ignition timing and look over the circulating system.

2225 **Wants Wiring Plan.**

From George Cottingham, Pennsylvania.—Please supply me with a wiring diagram of the 1914 Paige car. The system is a Gray & Davis. I have trouble with my lights going out when the car is running. I also have a magneto on the car.

Reply.—We have no record of the diagram mentioned. It can be obtained from the maker of the car or the manufacturer of the system, Gray & Davis, Inc., Boston, Mass. It would appear that you have some form of a short circuit. The manufacturer of the system supplies a very comprehensive instruction book which should be of service in locating the trouble.

2226 **Carburetor Hard to Adjust.**

From J. B. Keeron, Michigan.—I have a model 56 Overland which starts hard. I have to pump on the accelerator to keep the engine going and until it warms up. If I set the carburetor so that it starts easy, then the mixture is too rich for running. The carburetor is a model L Schebler. I have attached an extra heating pipe, taking heat from the exhaust to the bottom of the carburetor. I also have an extra thimble on the manifold just above the carburetor as a fuel saver. Is there anything I can do to remedy the trouble? The car has been run but 1,000 miles. Engine was overhauled last winter. Car will run fine then suddenly the engine will miss. It will pick up and run all right. If it does not it will stop. Do you think a new carburetor would remedy the trouble?

Reply.—The trouble mentioned is not uncommon. A mixture obtaining satisfactory results when the engine is warmed up and at operating speeds can be slightly thin or weak for starting speeds. Because of the difficulty experienced in vaporizing the fuel, carburetor manufacturers make use of a strangling valve or choker which enriches the mixture for starting. The valve either cuts down the supply of air or increases the amount of fuel. You might install a form of butterfly valve in the heating pipe and close to the carburetor. By closing the valve you would obtain a richer mixture than formerly. The fitting of such a valve should not be difficult. The carburetor mentioned is not an easy one to adjust; that is, to obtain a satisfactory starting mixture and one at higher and operating speeds.

2227 **Has Puzzling Knock.**

From C. T. Peirce, Virginia.—I have a 1916 Ford that I have been using since August, 1916. It gave me no trouble until June of this year. Since that time it has developed a knock, but only when I advance my spark. Sometimes it is very much worse than other times. I have had an experienced workman to take my engine out and go over every bearing, adjusting them perfectly; also put new wrist-pins in. I inspected the work before closing the engine; everything fits perfectly, as far as we can learn; but still the knock is as bad as ever. My timer rod is not bent just as it has always been. When I retard entirely up, the motor runs perfectly, without a knock, but of course don't develop any power, and heats up. I have been using a Ford for

Digitized by Google

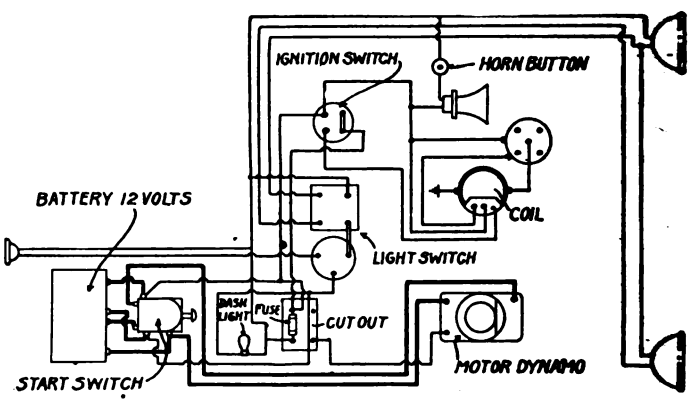
about six years, and thought I knew something about them, but this has me stumped. I hope I have made this clear enough for you to help me.

Reply.—Your knock may be due to too early a spark or to mixture. The fact the knock ceases when the spark is retarded indicates too much advance is being utilized. If the timer is that which came with the car and the linkage has not been altered, you should be able to advance the spark as far now as formerly. Has the timing of the engine been changed in the overhaul; that is, have the position of the gears been changed? We would suggest that you check up the timing and make sure that no change has been made, also check the valve timing. As to the mixture, if it is homogeneous; that is, burns rapidly, flame propagation is more rapid. On the other hand, if you have been using a thin mixture, which burns slowly, you would be able to advance the spark much more than with a quick burning mixture.

2228 **It's the Same Old Story.**

From H. I. Woodward, Vermont.—I have a one-cylinder 2 cycle jump spark motor on a railroad track car, equipped with a Schebler carburetor and National magneto. Car is started by pushing it along. All the parts are strictly new and motor is in fine condition, but to start it is a day's job, and a run of at least half a mile. When motor is once started it goes on one cycle for perhaps a mile or two, and then runs fine as it warms up. It is quite evident that the mixture is not right, but on this particular carburetor there is no air adjustment that I can locate. It is primed through a pet cock on cylinder. There seems to be the best kind of a spark and gap on plug is not quite the thickness of a dime. I understand all marine engines are inclined to start hard, but this seems to be an exceptionally hard one. What can you advise me to do?

Reply.—The trouble experienced with your two-cycle motor is due to mixture and is a common fault with the two-cycle engine. If you will start it with a rich mixture and gradually cut it down as the engine warms up you should overcome your trouble. There should be an air valve on the carburetor. If not, increase the amount of fuel by opening the needle valve. Your trouble in starting will doubtless increase with cold weather, and it may take patience to start the engine on a cold day. If you are to operate the engine in cold weather it is advisable to run a pipe or flexible tubing from the air intake of the carburetor to the top or side of the cylinder or exhaust pipe. This heat will assist in vaporizing the fuel but will not help in starting.



2229 **Some Gear Ratio Questions.**

From Harry H. Brown, Virginia.—Will you kindly advise me where I can purchase sheet asbestos suitable for lining the inside of the hood of my Buick car? On this car the exhaust pipe as it leaves the cylinders is very close to the hood and when the pipe gets hot it blisters the paint. If you can suggest a solution of this problem, please do so. Kindly advise me how the gear ratio of a car can be ascertained other than by counting the teeth in the differential gears. What is the gear ratio on the following cars: Buick C 36, D 55 and 1917 models Marmon and Mercer roadsters? Please advise if car manufacturers change the gear ratios on cars for different sections of the country, say for instance, a city as level as Washington, D. C., or one that is very hilly. If a car can travel at a rate of 38 to 40 miles per hour on the second on the level, how fast should it be in the high gear? This applies to a three-speed gearset. Does the use of ground cork in a gearbox do any harm?

Reply.—Asbestos suitable for the work can be obtained at any wholesale or large retail dealer in paper. Many automobile supply houses carry it in stock and of varying thicknesses. It is best for the purpose you mention. The gear ratio can be determined by methods other than by counting the teeth of the gears. It can be ascertained from the agent or manufacturer and by rotating the crankshaft one complete turn and noting the number of revolutions made by the driving wheel which should, of course, be jacked up. The last named method is not relaible, particularly if the car has seen considerable service as the wear of the gears, universal joints, etc., will prevent accurate measurements being made. The better way is to count the teeth or obtain the data from the maker of the car. The final gear ratios of the Buick C 36 and D 55 are 3½ to 1 and 3¾ to 1. The gear ratio of the Mercer roadster is 3 22/100 to 1, that of the Marmon is 3 69/100 to 1. Insofar as we know ratios are not arranged as you suggest. As to the speed of a car that travels so many miles per hour on the second, its speed on the high gear would depend upon the final ratio, etc. We do not advise the use of ground cork in the gearcase.

2230 **Due to Differential Action.**

From Henry F. Brunker, Michigan.—I have a 1915 four-cylinder Mitchell. In tearing out the wires I got into a nice mess. Will appreciate your sending me a wiring plan as I cannot get the starter to work. I had the rear wheels off to have the spokes reset and when I put them back I found one wheel would turn one way and the other in the opposite direction. I did not touch the differential. There seems to be a loose gear or something.

Wiring Diagram of Starting and Lighting System of 1914 Four-Cylinder Mitchell Car.

Reply.—The wiring plan of the car mentioned is shown herewith. If you experience any trouble in replacing the wires it is best to consult the expert of the service station of the maker of the lighting and starting system unless the car agent has a man who is thoroughly familiar with the system. Relative to the wheels rotating in opposite directions we assume you mean when both wheels are jacked

Digitized by Google

free of the ground. If such be the case your wheels will act in this manner and it is due to the principle of the differential gears, not to a loose gear as you imagine.

2231 **Yoke Bushings Worn.**

From J. E. Elder, Georgia.—I have a 1916 model D 45 Buick, and there is a little looseness or play at ends of driving yoke, and I think new bushings are needed. I want you to instruct me just how to proceed to put in these bushings with the least trouble. If the yoke has to be taken off, tell me just how to go at it, and greatly oblige. I wouldn't do without the Automobile Dealer and Repairer for anything.

Reply.—To renew the bushings in the model referred to take out the pins on which the yoke swivels. The universal shaft slides out of joint. The yoke does not have to be removed. The bushings can be secured from the nearest agency, and in putting these in it may be possible that some reaming may have to be done to obtain the desired fit. This is not always necessary but is probable. The job is not a difficult one and you should be able to complete it successfully.

2232 **Bothered with Rusty Water.**

From S. M. Rankin, Pennsylvania.—I have a six-cylinder Apperson car and the water in the radiator and engine passages is rusty. It has been in this condition continuously. Changing the water only helps for a short time. What is the proper remedy?

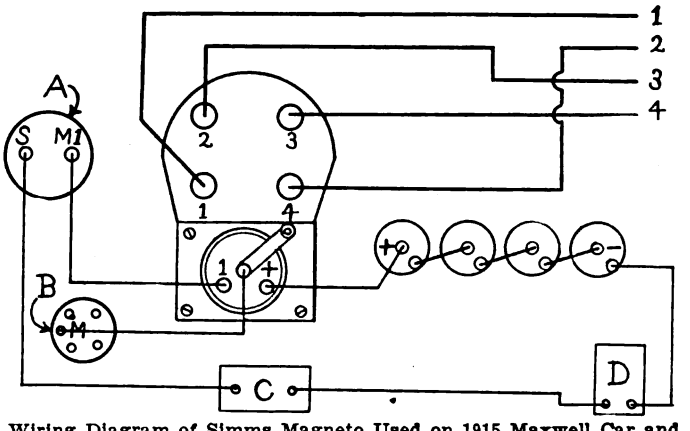
Reply.—The continued deposits of rust is evidently due to the use of a water containing iron. The average city water has more or less mineral deposits and these are deposited in the cells of the radiator and water passages of the engine. Try cleaning the cooling system with a solution of common washing soda and water using as much soda as the water will dissolve. Follow this, after washing out with clean water, with a 25 per cent. solution of commercial hydrochloric acid. Wash thoroughly after using the acid. If one treatment fails to remove the rust, use the second. After removing the rust and scale use rain water in the radiator.

2233 **Wants to Rebore Cylinders.**

From H. C. Shafer, Kansas.—I have a 32 Hupp and am thinking of having the cylinders rebored and over sized pistons put in. Please tell me if it is advisable and practical.

Reply.—The reboring of the cylinders is practical and will require the use of oversize pistons and rings. The prices for the work vary according to locality. It is advisable if the cylinders are badly worn and, provided of course, that the condition of the other components of the car warrants the expenditure. This is a question best determined by the owner.

2234 **Vibratory Type Is Best.**



From George McKnight, West Virginia.—I wish to put in a battery charging outfit to handle at least two 12-volt batteries or their equivalent from 110 volt alternating current. Will appreciate your advising me as to the maker of such apparatus and whether you would suggest a rectifier or a generator set.

Reply.—We believe you will obtain more satisfactory and economical results by utilizing a vibratory type. The Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., produce apparatus of this description and will supply complete details, prices, etc. Address the automobile department of the company when writing.

2235 **Maxwell Wiring Plan.**

From J. D. G., Rhode Island.—Will you publish a wiring diagram of the 1915 Maxwell car? It has a true high-tension Simms magneto but the ignition circuits are mixed with the lighting circuits.

Reply.—In the wiring diagram presented herewith A represents the type D coil, B the lighting switch, C the starter switch and D the fuse block.

Wiring Diagram of Simms Magneto Used on 1915 Maxwell Car and Showing Connections with Switches.

The wiring plan of the magneto and firing order is also included. It is important in rewiring or making any adjustments that the positive and negative connections be not reversed.

2236 **Fuel Line Is Clogged.**

From Frank E. Whittlesey, California.—I am having trouble with my engine stopping at intervals as if out of fuel. I was two hours travelling 2¼ miles recently. Had nine gallons of gasoline in the tank. Pipe from tank to carburetor is clean and there is a free flow of gas to the carburetor. This has got my goat. It happened a week ago and I haven't used my car since. What's the matter?

Reply.—Your trouble is doubtless due to a clogged spraying nozzle of the carburetor. The opening of this device is very fine, so much so, that it is termed a needle valve. When tiny particles of dirt or other foreign elements are in the fuel there is a possibility that the particle will be drawn up into the nozzle, choking it. This may be for a brief period and again the dirt may so clog the nozzle that the engine will not start. Clean the nozzle thoroughly and empty all fuel from the float chamber. But best of all strain carefully all fuel placed in the tank and open the filter line occasionally. The trouble mentioned is a common one and can occur when the fuel is strained with new cars. It is also advisable to clean the fuel line from tank to carburetor, also inspect the needle valve controlling supply to the float chamber.

2237 **Experiences Oil Trouble.**

From H. W. Slawson, Nebraska.—I am going to ask your advice concerning my Ford, which has been the source of considerable expense. If the front

Digitized by Google

cylinder in same had been designed to act as an oil pump, it could not have been improved upon, for it was just that from the very first, and when the car had covered about 1,000 miles or a little better, a slight tapping became noticeable only at a certain speed, about 15 miles per hour. Mechanics failed to diagnose the trouble, and when the car had been run about 4,000 miles, and had had three overhaulings trying to locate the knock, we finally decided it must be a piston in the rear cylinder, for by placing one end of a stick about the middle of a cylinder and your ear to the other end, when engine was running, it sounded like a riveting machine working over-time. The front cylinder in the meantime had made such progress that it cost me about as much for lubricating oil as gas, and I could not drive over 25 to 35 miles without cleaning the plug. Feeling that a new engine should not develop piston trouble in the first 1,000 miles, the agent took the matter up with the Ford assembly branch at Omaha. They advised shipping motor to them for inspection, which was done, and in due time it came back, also a bill for four .31 oversize pistons, a new crankshaft, timing gear, etc. When I wrote asking them what they found to be the cause of the trouble, they replied that the crankshaft was worn out of round, but made no mention as to why it was necessary to put in the largest oversize pistons. Since receiving the motor back it has been run about 1,200 miles, but now there are three cylinders that pump oil, and one cylinder has very weak compression. I had valves ground and carbon removed, thinking perhaps a pitted valve was the cause of the weak compression, but valves and springs are all right. The compression must escape past rings. A mechanic who cleaned my car recommends the Inland one-piece ring. This car was unloaded and set up one day and delivered to me the next, and never has been abused or overheated. Will you kindly advise me your opinion as to the probability of leak-proof rings overcoming my trouble, and if this ring I mention, the Inland. one-piece spiral cut, would be as good as any, and would one at the top of each piston be sufficient, or a full set necessary.

Reply.—The fact that the oil works past the rings and pistons indicates probable cylinder defects, that the walls are either scored or the cylinders worn oval or out of true. This can be determined by measuring the cylinders with an instrument designed for this purpose and it will require the services of one familiar with the work to obtain results. Using leak-proof rings will improve the compression and eliminate to a certain extent the passage of oil past the pistons, but one must not expect the rings to overcome the trouble created by faulty cylinders or pistons. It would be advisable to use a complete set of rings on each piston. If the cylinders are not too badly out of true it is possible that by using the rings mentioned and treating the pistons that the trouble may be overcome. The treatment consists of beveling the skirt or lower edge of piston walls and ring grooves and drilling holes of 1/32-inch in diameter from the beveled or chamfered edges. This method is held to be of value in that the surplus oil on the cylinder walls is subjected to a scraping action, and as the lubricant gathers it is forced through the drilled holes and back into the crankcase. There are several methods but the principles are similar.

2238 **Carburetor Information.**

From Adam Miller, Ohio.—Kindly give me the name and address of the maker of the Federal Zephyr carburetor.

Reply.—The carburetor referred to is manufactured by the Federal Brass Works, 362 Twombley avenue, Detroit, Mich.

2239 **Another Charging Question.**

From B. E. Harrington, Maryland.—Will you be so kind as to tell us how we can charge automobile storage batteries from a Fairbanks-Morse outfit, dynamo rated at 9 k.w. and operates at a voltage which supplies the lamps with 30 volts? It is a multi-polar, compound wound machine.

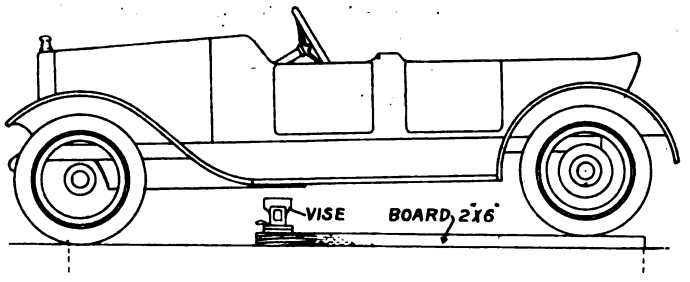
Reply.—A diagram for charging with a bank of lamps for resistance was printed in the August issue on page 56, also in this issue. Complete directions are given for estimating the proper amount of resistance and rate or flow of charging current.

2240 **Won't Remain in High.**

From Albert L. Mowry, Colorado.—I have a 1917 light weight Chandler Six. It has been run about 11,000 miles. It is continually slipping out of the high gear. I cannot see anything the matter with the gears. Sometimes it will run for miles without slipping, other times about 30 or 40 yards. I will be pleased to know just what is the matter with it. I have had it at the local garage but they could not find anything the matter with it.

Reply.—With the selective type of gearset the high is supposed to lock in position automatically. The movement of the gear with its clutch into engagement with the clutch of the constant mesh gear is accomplished by a shifting fork. This fork is attached to a rod called the shifting rod and this rod is provided with what is termed rod locks. When the gearshift lever is moved to the high position the shifting rod actuates a shifting fork and the fork in turn moves the gear with the clutch forward into engagement with the clutch of the constant mesh gear. The tendency of the clutches, called jaw clutches, to disengage is overcome by the shifting rod lock. After considerable wear the lock may not hold, allowing it to jump out of position, or again it may require adjusting. Remove all lubricant from the parts mentioned, and throw the gear into high. Next test for play of the rod and fork, also see if there be undue movement, back and forth, of the high gear. Adjust shifting rod locks above referred to.

Ford Rear Axle Trouble.



From S. C. Brier, Kansas.—After reading the article by F. H. Shultz of Kansas, in the August issue, I have decided to give my experience. I have had lots of experience along the line mentioned by Mr. Shultz. I find the best way is to remove the wheels and bearings, wash out the differentials with gasoline, having first taken out all of the old grease. Next take small handfuls of waste and insert it in each side of the axle housing, pushing it in with a screwdriver. Insert one or two felt washers and replace the bearings and wheels. Mr. Shultz will not experience any more trouble. His trouble is that he is keeping too much grease in the gearcase. The felt washers will not wear out as the roller

Digitized by Google

bearing cages do not turn. The felt washers should fit snug on the axle. I trust this information will be of value to other motorists experiencing similar trouble.

A Question of Law.

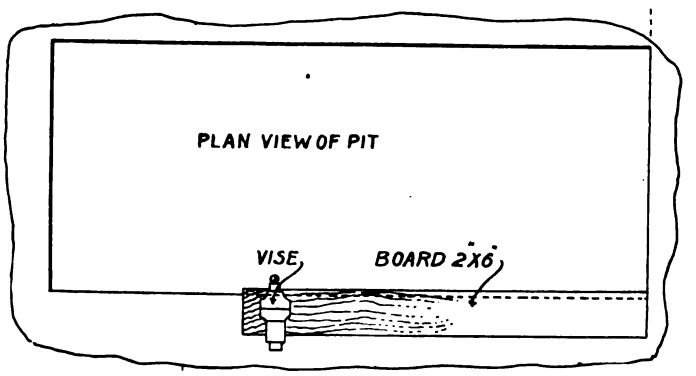
From Murphy Smith, Pennsylvania.—Would like to have some information on automobiles passing other conveyances of any kind from the rear. There seems to be a lot of different opinions. Some say the party wishing to pass does so at his own risk, takes all responsibility when he dies. Others claim he has the same right as when coming toward each other. This is for roads not wide enough for three

Suggestion of Reader for Retaining Vise at Pit.

machines to pass at once. Will outline what happened to myself. Was overtaking two horses being led by the heads, and sounded my horn when about two hundred feet away. Was not going over 15 miles per hour at this time. The man leading the horses gave no sign of hearing, but a boy behind the team ran around to the front after looking back. The horses were taking up all of the road from the center to the right. I horned again for passing, this time less than 50 feet behind, got no sign of recognition, so decided to pass, as there was nothing then in sight for at least 200 feet coming my way. A machine was nearly that far ahead going the same way. I had slowed down to 10 or 12 miles per hour by this time. When I was about even with the horses a motorcycle showed up from the opposite direction between my automobile and the one about 200 feet ahead of me. I was giving the horses lots of room. Before I could get back to the right side of the road, ahead of the horses, the motorcycle ran into me head on. The rider received a broken leg and some small cuts and bruises, a wrecked motorcycle and I lost a radiator. Later I asked the rider how fast he was going and he told me about 26 miles per hour. Did I have the right to pass or not?

Answer.—From your statement of the facts leading up to the collision, we would have no hesitancy in saying that the man on the motorcycle was at fault and could not recover for the consequences of the accident. You had a perfect right to pass the horses provided in doing so you exercised reasonable care. The mere fact that you were passing the horses and were on the left hand side of the road would not give the motorcycle the right to run into you. Even if the horses were not there and you were on the left hand side of the road, the motorcyclist would have to use his utmost endeavors to avoid a collision, but in such a case sentiment would be against you, because the rules of the road require you to drive on the right hand side of the road when not passing other vehicles going in the same direction. There is no such rule that one man passing another on the road does so at his own risk. Such a proposition would be ridiculous. The law requires every one on the road to exercise due care for the rights of the other travelers and in closely contested disputes leaves the ultimate decision as a question of fact to be decided by a jury, or if there is no jury, by the judge.

Assuming that the facts you state are true, we have no doubt but that you could recover for the loss of your radiator.



Plowing With a Motor Car.

From M. T. R., New Rochelle, N. Y.—My attention has been called to an article in your September number on plowing by the use of motor cars, and it was stated that by this method a speed of six miles an hour could be maintained. In fact, the article says that 12 miles an hour was accomplished for a period while the experiment was tried. The writer knows a little something about farming, having been born on a farm, and followed oxen for plowing. The man who follows a plow, even drawn by oxen, day after day for several days, is going to be about as tired as he wants to be. It seems to me ridiculous to assert that anybody could follow a plow being dragged by a motor car at the rate of six miles an hour. It takes a mighty good walker to get over the ground at a gait of four miles an hour for several successive hours, though it might be done perhaps faster for a mile or two. Six miles an hour is practically running for any man, and no man can run behind a plow all day long and guide it properly at any such speed. The experiment referred to may have been tried as stated, but it certainly would not be practicable to plow for any length of time in any such way as this.

I should be glad to hear from other readers on this question.

Handy Vise Kink for Pit Work.

In taking up bearings and performing work on the engine with the car over the pit, one frequently

Plan View of Vise and Board and Showing Location at Pit.

has to crawl out to do some work that requires the services of the vise. A repairman, and a reader of the Automobile Dealer and Repairer, sends the following suggestion for holding a vise in place on the edge of the pit and the plan is a most excellent one.

The vise is secured to a 2x6 piece of wood and is laid parallel and flush with the sides of the pit as shown in the plan view. The car is rolled over the pit, and the rear wheel rests on the board carrying the vise. The weight of the machine is sufficient to hold the plank in place. With this arrangement the workman can save considerable time to say nothing of having a vise handy for pit work.

Digitized by Google

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.

Objection to it has been made, on the part of those having cars and other things to sell, that a recital of the more or less fatal accidents in these columns is likely to discourage people from buying automobiles.

This view of the matter is, of course, rank nonsense. The place where an automobile accident might interfere with the sale of cars would be in the neighborhood where the accident occurred, and perhaps within the radius of the influence of the local paper in which the affair would be reported. What we see affects us far more than what we read about. The particulars of every such accident are printed in one or more newspapers. The publicity given in the Automobile Dealer and Repairer would reach people far removed from the scene. Manifestly, the fewer accidents there are the less they become an obstacle to sales. This department, by familiarizing its readers with a great variety of accidents, and their causes, enables them to be on their guard against similar accidents. In this way, by reducing the number of accidents, it is a distinct help to every car manufacturer in the country.

The object is to encourage our readers to be careful and avoid acoidents which may lead to mutilation or death. We have every reason to believe that this department has not only averted many serious accidents but probably has saved a good many lives since it was inaugurated. Manifestly, the fewer accidents, the less danger of frightening people who are on the point of buying cars.

Acoidents happen on railroads—lots of them—people are maimed and killed, but nobody stops riding on a railroad in consequence.

People are run over in the streets every day by automobiles, and yet nobody stays at home and refuses to walk in the streets because of the liability of injury in this way. Accidents of one kind and another are happening in all sorts of ways in all walks of life. If we can instil into the average individual a greater degree of caution than he has been in the habit of practising, manifestly the percentage of accidents will be reduced.

A number of the accidents described herewith are said to have been due to the failure of the brakes to grip properly. There is no excuse for faulty brake action. If owners would test their brakes, and by this is meant the emergency as well as the service, it would reduce the number of accidents due to this trouble. The usual number of inexcusable accidents, collisions between trains and automobiles at railroad crossings, are reported. These accidents could be avoided by exercising caution. Skidding continues to be the fruitful cause of accidents.

Cigar Causes Accident.—Two women were severely injured near Baltimore, Maryland, when the driver of a car turned his head to throw away a cigar. The machine jumped the curb when the driver lost control.

Entire Family Killed.—A farmer, his family of four, and a young girl were killed near Williams, California, when the driver of the machine drove directly in front of an express train. The fuel set afire by the collision burned the driver to a crisp.

Man and Wife Killed.—A man and his wife were instantly killed near Dixon, Colorado, when the man attempted to cross ahead of a train at a crossing. The view of the crossing is unobstructed, it is said, and can be seen for nearly a mile in either direction.

Two Dead as Result of Skidding.—The too sudden an application of the emergency brakes caused a car to skid and overturn near Red Bank, New Jersey. Two men were killed.

Careless Driving.—Five persons were injured when a motor car struck a tree near East Stroudsburg, Pennsylvania. The driver of the machine turned his head to speak to a passenger in the rear seats.

Brakes Failed to Hold.—Five persons were injured near Gettysburg, Pennsylvania, when a big touring car crashed into a stalled motor truck. The brakes of the passenger vehicle failed to hold.

Insect Causes Accident.—An unusual accident occurred near Jersey Shore, Pennsylvania, when the driver of a machine loaded with passengers attempted to kill an insect with his foot. The bug was annoying the occupants of the car, but in his endeavor to destroy the insect he lost control. The car went up and over a bank and on its side. The passengers escaped with severe bruises.

Driver Sleeps at Wheel.—A 19-year-old boy fell asleep while making a return trip and after a long drive. He was awakened by the crash of his car turning turtle and pinning him underneath. Several bad cuts, which will lay the careless driver up for some time, resulted from the untimely nap.

Forgot His Emergency Brake.—A driver of a car at Battle Creek, Michigan, and two passengers were badly cut by flying glass when the machine met a street car in a head-on collision. The driver became rattled and forgot he had brakes other than the service members.

Tried to Cross Railroad Tracks.—In an attempt to cross the railroad tracks ahead of the approaching train, eight persons were killed near Saybrook. Connecticut. According to reports the driver tried to cross, or beat out the engine. The engineer slowed down but it is stated the accident could not be averted. The crossing is held to be a dangerous one.

Brakes Failed to Hold.—The failure of both the service and emergency brakes to hold plunged a car over a 40 foot embankment near Le Roy, New York. resulting in the death of two of its passengers and the injury of nine others. The driver in turning the car lost control as the brakes failed to hold.

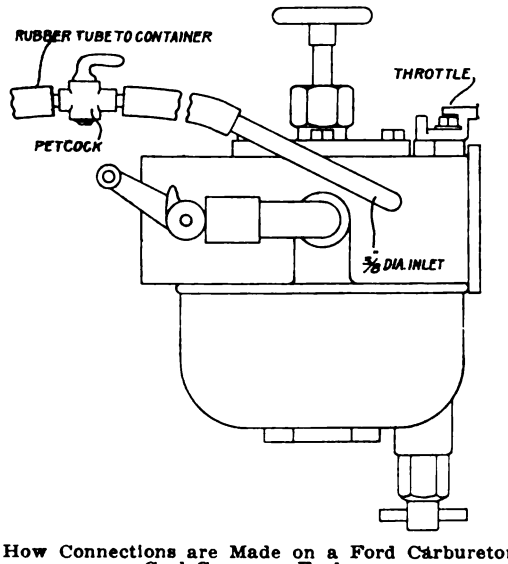
Stops Car on Track.—The stopping of a car on the railroad track, and failure to note the approach of a train, resulted in the death of four persons near Bellows Falls, Vermont. The driver stopped the machine which was hit by a freight train while the automobilists waited for another train to pass.

Car Slides Down Hill.—While attempting to make a change of gears on a hill, a machine near Singac. New York, got beyond the control of the driver and ran backward until it overturned in a ditch. The brakes failed to hold. One person was killed.

Stooped to Pick Up Glasses, Kills Pedestrian.—A driver near Elberon, New Jersey, stooped to pick up his glasses and lost control of the car which struck a pedestrian who later died of his injuries.

Inexperience Causes Accident.—Inexperience in operating a machine resulted in the driver receiving a broken leg and another passenger being badly cut at Binghamton, New York. The driver successfully passed a team but failed to make a proper turn and crashed into a tree.

Tires Have Gone Up.



The list price of automobile tires has been advanced by the majority of the manufacturers. In some cases the raise in price has been moderate. Inasmuch as the dealer was advised of the raise before it went into effect, the majority were well stocked and gave their customers the benefit of the old price.

Digitized by Google

COAL GAS AS A FUEL.

Three Hundred Cubic Feet Equivalent to a Gallon of Gasoline.

More or less comment is being made in the daily press as to the use of coal gas as a fuel for motor cars in England. The use of a substitute fuel has been necessary, for gasoline last April sold for 68 cents the gallon in England and to-day is 90 cents inclusive of tax. There is nothing new in the use

Showing How Connections are Made on a Ford Carburetor Using Coal Gas as a Fuel.

of coal gas as a fuel; in fact, it is stated that as early as 1896 coal gas was tried out with success. To-day there are numerous concerns engaged in supplying coal gas and the containers.

Storing the Supply.

The containers utilized for storing the gas vary in capacity, are flexible, and are usually mounted on the top of the commercial vehicle, which type of cars utilize the fuel. The container is made up of two layers of cotton fabric with an interposed layer of pure rubber. The last named is applied to the foundation in successive coatings, each about as thick as a cigarette paper, during the passage of the foundation through the steam heated machine. Pressure and heat is held to prevent pores and to impart a waterproof surface to the exterior. The most common type of container or bag is an inverted D. A strip, on the side with eyelets, provides means for securing the bag to the top of roof of the vehicle.

Capacity of Containers.

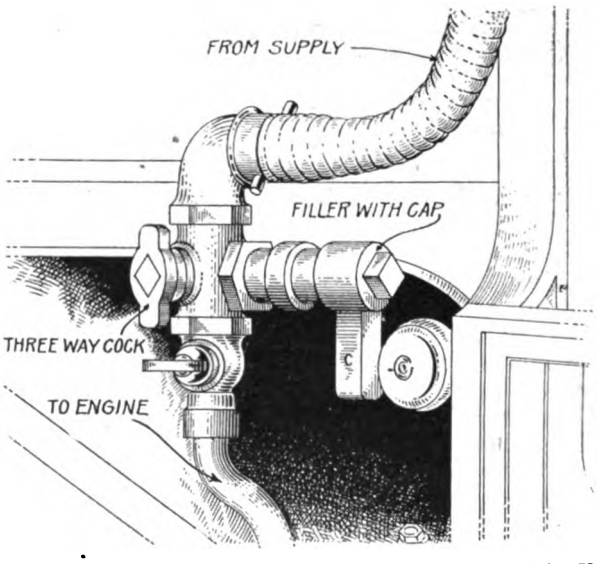
The capacity of the containers range from 290 to 500 cubic feet, and the feed pipe is generally a one-inch perforated hose, with open mouth lying with the bag, and this pipe is vulcanized in.

Gasoline or special carburetors are used, but the ordinary carburetor and manifold can be utilized with a slight alteration and the gasoline supply can still be available in case the coal gas gives out.

How Gas is Supplied.

In some instances the gas is introduced through a tube inserted beneath the choke tube of the carburetor, with the tube end so treated as to slightly flatten it and decrease the orifice of the tube. This enables the tube to be brought up closer against the jet and more central with the choke tube. The control of the fuel supply is by a stop tap, but objection is made to this method in that there is a loss of gas if the driver does not close the tap when the engine is stopped. The gas escapes because it is lighter than air and rises.

Gas Fuel vs. Gasoline.



It is held by those who have made a study of the fuel that it is not so efficient as gasoline as the majority of users of coal gas use too rich a mixture, too much fuel in proportion to the air supply. Then again there is trouble if the gas nozzle be not properly set in the choke tube and only when partially inserted the power is apt to be poor. The area of the nozzle seems to vary about .0065 to .0075 square inch for each horsepower of the engine.

How Connections Are Made.

The feed pipe is carried down the front left side stanchion to the dashboard, and brought to a point convenient to the driver of the car, as shown by an accompanying illustration. The fittings to engine and dashboard may be gathered from our illustrations. Upon the dash is a three-way cock to which is attached the armoured hose connection to the gas bag, the engine feed pipe, and a short section of horizontal barrel running towards the edge of the dash respectively. This last-named length forms the connection for charging up. When attached to the main and the cock is moved a free passage for the gas from the main to the container is afforded, communication with the engine being cut off. When the bag is filled another turn of the cock cuts off the connection between the charging end and the gas bag. To obviate escape of gas by the inadvertent movement of the gas-cock, the charging pipe is sealed with a cap.

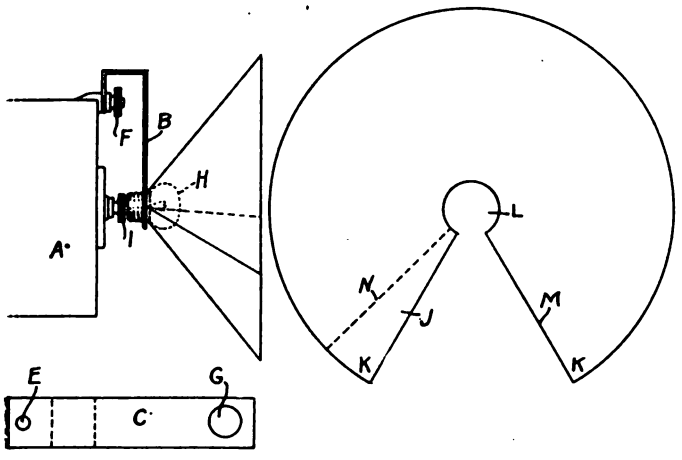
Fittings Are Simple.

The engine fittings are simple—½ inch barrel with elbow joints—all fittings are standard gas barrel, joints and unions—is run from the three-way cock to the motor, the intake manifold being tapped

Illustrating Gas Connection on an English Motor Vehicle Using Coal Gas as a Fuel.

back of the carburetor, so as to bring the gas feed as near as possible to the inlet valves. Between the dash and the intake manifold a valve is introduced, this being connected up to the ordinary carburetor throttle operated by the accelerator pedal. Thus control of the gas and air is secured. By the arrangement adopted it is possible to run the

Digitized by Google



vehicle on either coal gas or gasoline, and to switch over from one fuel to the other as desired without making the slightest adjustment beyond a turn of the gas tap on the dash to prevent the gasoline vapor entering the gas bag and to obviate any mixture of the two gases.

Costs Compared with Gasoline.

A slight leakage is said to take place despite the care taken in constructing the bags. Three hundred cubic feet of coal gas is said to be the equivalent of one gallon of gasoline, and as the gas costs about 48 cents the 1,000 feet this works out to about 14.4 cents to obtain the same results as would be secured were one gallon of gasoline used. The introduction of gas is, of course, due entirely to the war. It is stated that the exhaust is objectionable, that the police object to it and that the army authorities will have nothing to do with coal gas as a fuel.

Home Made Trouble Lamp.

Dry cells are not serviceable for ignition when they read below approximately eight amperes. Generally the cells are thrown away or used on a bell circuit. Use can be made of these cells by making the attachment shown in the accompanying illus-

Illustrating Method of Making a Trouble Lamp and Utilizing Dry Cell for Source of Current Supply.

tration, and the lamp when completed can be utilized as a trouble lamp or for general lighting purposes.

The connections or holder for the bulb are made by taking a half-inch strip of 1/16-inch thick copper and bending it to the shape shown at B. This part is illustrated at C which has two holes, E and G, these being utilized for attachment to the battery terminal at F and to pass the screw part of bulb H through. The fit of the bulb should be snug.

The reflector is shown at J, and is made of a piece of bright tin. It is cut to a circle four inches in diameter, and two inches in circumference is measured off at K K and cut to the shape as shown. The diameter of the opening at L is one-half inch. The reflector is then made by bending the metal into shape and soldering the edge M to the dotted line N. When use of the light is desired the part B is swung until a contact is made at I. A represents the dry cell.

To Use Taxes for Roads.

A system of State roads in Illinois, embracing 4,000 miles, and all hard-surfaced, is to be built exclusively by the proceeds of taxation on automobiles, according to a project to be submitted to the voters of that State next November.

The most interesting feature of the project is the method of raising the money for the work. It is proposed to issue bonds which will be paid off from the proceeds of automobile taxation exclusively. Prolonged study of the use of improved roads has convinced the State officials that such a State-wide system of highways will be used so extensively by automobiles and trucks that the cost of the improvements should be borne by the owners of such vehicles. At present the license fee for cars ranges from $3 for 10-horsepower or less to $10 for 50-horsepower. Next year the taxes will be increased so that the limits will be $4.50 to $20, and in 1920 they will be increased to $6 and $25. The present motorcycle fee of $2 will be increased to $3 in 1918 and $4 in 1920. The fee for electric vehicles up to twenty tons capacity is now $5; this will be increased to $10 next year and $12 in 1920. Electric vehicles of over two tons pay double these fees except in 1920, when the license will be $25.

It is proposed to begin issuing bonds in 1920, putting out $10,000,000 in that year, and to make a similar issue annually until the total bonded indebtedness is $60,000,000. It is proposed to let the first contract in 1920. In that year it is estimated that the license fees will amount to $4,800,000. The State officials estimate that in 1944 the fees will amount to $6,000,000, and both principal and interest will have been paid. The interest rate which is proposed for the bonds is 3½ per cent.

New Books Received.

Acknowledgment is made of the following books and house publications.

How to Run and Install Gasoline Engines. By C. Von Culin. The Norman W. Henley Publishing Co., New York City. This book deals with both the two and four-cycle engines and is very comprehensive in its treatment of the subject. The retail price is 25 cents.

Legal Points for Automobile Owners. By Leslie Childs. J. S. Ogilvie Publishing Co., New York City. This publication gives briefly and precisely the information an automobilist should know, particularly his liability under various circumstances. The book sells for 50 cents.

The Ford Motor Car and Truck and Tractor Attachments. By Harold P. Manly. Frederick J. Drake Co., Chicago. Deals with the construction, operation and care of these vehicles.

Automobile Records and Diary. William Garrison Reed, 108 Water Street, Boston. A neat, cloth bound, pocket size book for entering the records of trips made in the motor car. Pages are supplied for cost data, etc. Room is afforded for entering data as to size of fuses, bulbs, etc., used on the machine. The diary proper can be removed when filled and replaced with a new one. The retail price is one dollar.

Drill Chips. September issue of house organ of Cleveland Twist Drill Co. Contains interesting information as to the use of drills in munitions, etc.

The trouble experienced by some owners in removing spark plugs, a condition referred to by the repairman as frozen, can be avoided by the use of a mixture of graphite and oil. Make a thick paste and smear it on the threads of the plug.

Digitized by Google

FUEL CONDENSATION.

Suggestion for Overcoming Troubles Due to Use of Heavy Fuel.

The deposition of fuel particles, commonly referred to as fuel condensation, on the walls of the intake manifold is more prevalent than formerly when the gasoline was more volatile and more easily vaporized. The mising, fluttering and overloading when starting the engine from cold are symptoms with which the average motorist is familiar, particularly the owner of a car that is several years

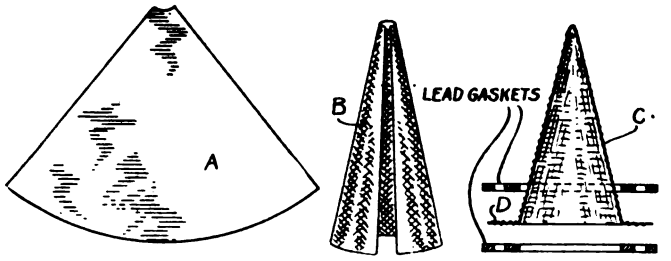


Fig. 1—Preventing Fuel Deposition: A, Pattern for Gauze; B, Cone Rolled to Shape; C, Cone and Flange; D, the Flange.

old and not equipped with a strangling device and means for utilizing the heat of the exhaust. The missing and fluttering disappears after the engine warms up and when the throttle is opened, and cannot be ascribed to the size of or the adjustment of the jets.

Gauze Pulverizes Fuel.

The cure for this trouble, says The Autocar, is the fitting of one or more cones of fine brass gauze No. 80 mesh in some cases, and No. 60 in others. The No. 80 is held to be more effective where it can be used. The cone of gauze, where only one is used, should not be placed, if this can be avoided, in a straight intake manifold, as the wire forming the gauze tends to restrict the area of the passage and results in loss of power at high speeds. It is better that the cone should project into some open space, such as the intake passage in an enbloc cast engine, or in the junction of a Y shaped manifold. In the latter case, however, the stem of the branch must be very short, and the flange quite near to the junction of the arms, as shown in an accompanying drawing.

Two Cones Required.

Where the Y has a long stem it is not possible to fit the cone without throttling the mixture supply, and in a case of this kind it is adviseable to fit two cones, one at each end of the Y branch, with the apexes of the cones projecting into the cylinder casting. Inside the casting there is usually an irregular shaped space from which lead a pair of intake passages directly to the two inlet valves, so that the mixture which passes through the gauze can get away in every direction with ease.

Making the Pattern.

For the benefit of those who have suffered from the trouble mentioned, and who wish to experiment with one or more cones of gauze, a series or illustrations are given herewith showing how the cone should be formed and fitted. It is preferable, in the first place, to cut a paper pattern which, when opened out, will take a form shown at Fig. 1-A. The exact shape and area of the correct pattern will depend upon the diameter of the intake flange to which the cone is to be fitted, and also upon the length the cone is to be made. The cone should be as long as possible, within reasonable limits, and at a point about one inch from its base of the same diameter as the interior of the intake pipe flange.

Shaping the Cone.

After the pattern has been cut, it may be marked off on the gauze to be used. The edges of the latter, after it has been cut out, must be cleaned with fine emery cloth to a width of about a quarter of an inch. These edges should then be "tinned," preparatory to soldering them together after the gauze has been bent over to a cone shape with the edges overlapping to the extent of about three-sixteenths of an inch or slightly less, as shown at Fig. 1-B.

It will probably be found that the apex of the cone cannot be brought easily to a point, but if the cone be made longer than necessary as regards the distance from the apex to the point where the diameter is the same as the flange hole, the top can be cut off to form the correct length of cone plus a quarter of an inch, and this extra quarter of an inch split, turned in, and the pieces soldered together, forming a slightly flat apex.

Forming the Flange.

The extra inch at the base is intended to be split up with a pair of scissors and turned over so as to form a flange, as indicated at Fig. 1-D. At opposite side sufficient of this flange is cut out to allow for the flange bolts of the intake pipe, and one of these clippings should include the lap joint, so far as it is bent over. The flange of this cone will then be of irregular shape, but it should not be trimmed up until it has been secured in position.

The next requirement is a lead gasket, or preferably two of these, shaped to fit the flange of the intake pipe or cylinder casting; that is to say, with a large hole in the center of the same diameter as the hole in the intake passage and two small holes at each side for the flange bolts. If now one of these lead washers be placed at each side of the cone flange, the latter will bed into them when bolted up

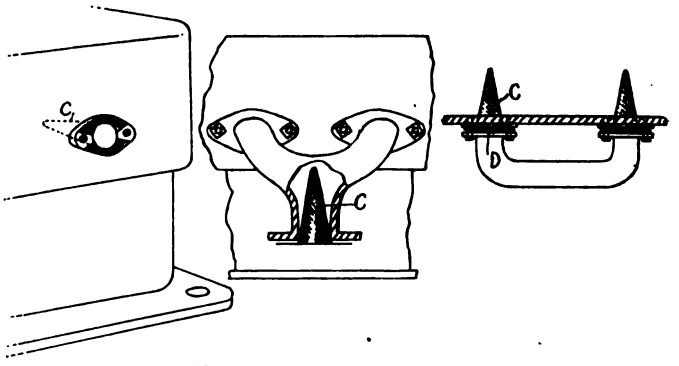

Fig. 2—Preventing Fuel Depositation: C, Cone in Enbloc Casting; Same in Y Type of Intake Manifold; D, Showing Assembly Used with Y Type.

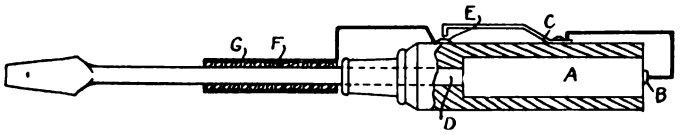
tightly in position, so forming an airtight joint and also a good conductor of heat from the cylinder casting to the intake pipe—a very desirable thing with heavy grade fuels, as vaporization is assisted when the intake pipe is heated.

When the cone, washers and intake pipe have been bolted up tightly, the flange of the cone may be trimmed off neatly. There should be little need to explain the purpose of the cone, but it may be said that when the partially atomized fuel passes through the cone it must be broken up into much



Digitized by Google

smaller units, especially as it approaches the inner surface of the cone diagonally.

The fitting of a cone is said to have completely stopped the misfiring and fluttering referred to, and further than this, in several cases it has resulted in a marked increase of power and improvement in fuel consumption. It should be mentioned that the gauze requires cleaning occasionally, as the mesh becomes choked with dust and carbon, and that after two or three thousand miles running it tends to disintegrate and should be renewed.

A Magnetic Screwdriver.

A reader contributes the following method of making a magnetic screwdriver, and states that it can be utilized to advantage in starting very

Illustrating Method of Making Magnetic Screwdriver by Using an Ordinary Flashlight.

small screws and for picking up small particles of metal. The work is accomplished by boring a hole in the handle of the screwdriver and attaching an ordinary vest pocket type of flashlight. A wire is soldered to the terminal B and connected to the contact part C, it being soldered.

The other end of the battery comes in contact with the metal part of the screwdriver D. A small screw or nail E is driven into the handle, a wire soldered to same, and it is connected with the coil F. This coil is protected by a rubber tube. The end of the wire in the coil is soldered to the screwdriver at H. The tool is operated by pressing the spring C, the latter making contact with E. It is stated that this will magnetize the blade of the tool.

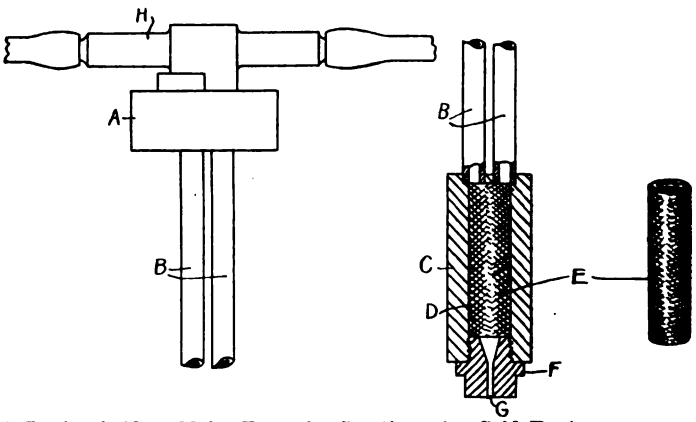
"The Quieterion."

As a rule a house organ is a vehicle for creating interest in the product of the manufacturer who pays the expenses of the publication to see the name of his goods in print. The really interesting items generally wind up with some reference to the article made by the manufacturer, and as they say in the movies, "It lacks the punch." Not so with "Quieterion," a monthly publication issued by the Hyatt Roller Bearing Co., Detroit, maker of the Hyatt quiet bearings. Perhaps the editor calls his publication a house organ because he is modest. As a matter of fact it is the best, brightest and most interesting little book that has come to our attention for some time. It will interest every reader, and the only criticism we make is that one is apt to neglect his work until he has read the book from cover to cover. We quote a couple of excerpts to show the "punch" referred to. "That Willys-Overland agent in Paris, Texas, named 'Briscoe Dodge Chandler,' ought to go into partnership with 'A. Ford Carr,' of Chicago. And yet there are those who say there is nothing in a name." Another worth digesting by the employee is, "If your job, even with all its troubles, isn't a Constant State of Happiness, then, for Goodness Sake, change the job." And last but not least we must give the editor credit for not filling his publication with references to the products of the concern employing him. A copy of "The Quieterion" is well worth writing for.

MAKES STARTING ENGINE EASY.

A device for making easy the starting of an engine when cold, and providing the proper amount of mixture when the engine is running very slowly or idling, has been brought out by an English inventor. The device is made to be screwed into a two-gallon fuel can or other similar container.

How Device Is Made.



The lettered drawing shows the plan of the device. The threaded cap A below the T-piece is similar to those used on fuel and oil cans; that is to say, it is a large cap. From the cap depend two small brass tubes, B, each having a bore of about ⅛-inch, and secured to the lower end of these is a brass casting C drilled to about ⅜-inch diameter. The cylindrical space D is filled with tight roll of fine gauze E, and the gauze is held in place and the lower end of the casting closed by a screwed plug F.

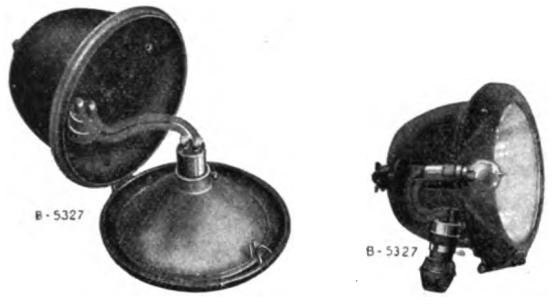
Control of Fuel.

A small hole G is drilled through the plug, and this hole obtains in effect a jet or limiting orifice, controlling the amount of fuel which can pass from the container. Formed with the cap is a T-head piece drilled at each side so as to communicate with one of the small pipes in the interior of the container. These pipes have a similar bore, but do not communicate with each other except through the brass cylinder at the bottom. One forms the air inlet to the starter and the other forms the mixture outlet, the mixture being carried from one branch of the T-piece, to a nipple screwed into the intake pipe of the engine, by means of a flexible connection, rubber tubing for example.

Operation of Device.

When the throttle of the main carburetor is closed, the suction of the engine takes effect upon the column of fuel standing normally in the two vertical

A Device Said to Make Easy the Starting of a Cold Engine and to Improve Idling and Operation at Low Speeds.



tubes; thus a very rich mixture is provided for the first two or three explosions, after which a suitable slow-running mixture is formed by the suction of the engine drawing air through the closely packed gauze which, in turn, is kept saturated by the fuel finding entry through the gauged hole in the screwed plug. With each fitting it is proposed to supply three sizes of plug, so that the only adjustment necessary when the device is being adjusted is to try first one and then another of the optional plug sizes until the best results are obtained.

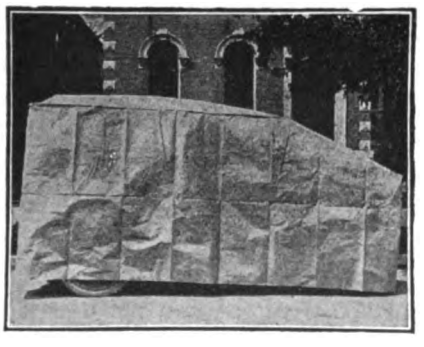
USEFUL WINTER EQUIPMENT.

What the Manufacturer Is Providing for the Comfort of the Mortorist.

With the approach of November the old and experienced motorist formulates plans for placing his car in first class condition and for equipping it with



The New Corcoran Side Electric Lamp Can Be Used as a Trouble Lamp.

those devices which make driving a comfort and a pleasure in cold weather. Motoring during the winter is becoming more and more popular each year and the number of owners who store their machines during the winter months is gradually decreasing. There is, as there always will be, certain localities where the use of the automobile is somewhat restricted by climatic conditions but even in these places the car is employed during the greater part of the year.

Improvements in Equipment.

The manufacturer of equipment, and by equipment is meant the hundreds of devices that lighten the labors of the owner, has made wonderful progress during the past year or so in developing his product. The invention of different types of heating apparatus has made possible the heating of the private garage at a minimum cost of upkeep and labor. No longer does the motorist have to struggle with a cold engine for in addition to the garage heating equipment there are numerous devices for starting the engine from cold. The driver today is not obliged to face the discomfort endured by the motorist ten years ago for with the

The Kennedy Auto Storage Cover Is Heavy and Durable and Will Keep Out Dust, Etc.

numerous types of winter enclosures, car heaters, etc., one can drive on the coldest day with absolute comfort.

Despite the shock of the war and scarcity of material there is offered the motorist a large number of new accessories and equipment. These range from devices designed to lighten the work of the owner who cares for his own machine to a heating apparatus operated by the exhaust of the engine.

Freeze-Proof, a Ready Prepared Anti-Freezing Mixture Easily Used and Having High Boiling Point.

For those who store their cars during the winter, and who wish to protect the finish, upholstery, tires, etc., there is offered the Kennedy auto storage cover shown herewith. These are constructed of a very heavy, tough, durable paper which will resist the action of moisture and keep out dust, etc. The covers are made in standard sizes, will fit any automobile and are very reasonable in price. They are manufactured by the Kennedy Car Liner & Bag Co., Shelbyville, Ind.

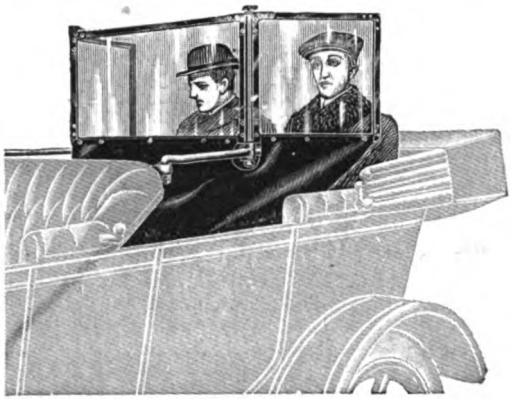
Novel Combination Lamp.

A novel and practical lamp, one that can be utilized for a trouble or inspection light as well as for a side member, has been brought out by the Corcoran Lamp Co., Cincinnati, Ohio. As may be

Cylinder Head for Ford Car Providing Greater Water Space and Preventing Overheating.

noted by the accompanying illustrations the reflector, instead of being secured in the body, is attached to the door which is hinged at the bottom. When the door is opened it carries the bulb and reflector with it. By raising or lowering the door, the light can be directed downward at any angle desired. This permits use of the lamp for inspecting the engine, tires, etc. There is no rattle as the connection between the door and reflector is solid, and the bulb is always in focus. The lamp is 4¾ inches in diameter and can be used on a three, six or nine-volt circuit. The body is black enameled. The lamp is

The Fire Gun Fire Extinguisher, a Sturdy, Compact Design and Having a Protected Nozzle.



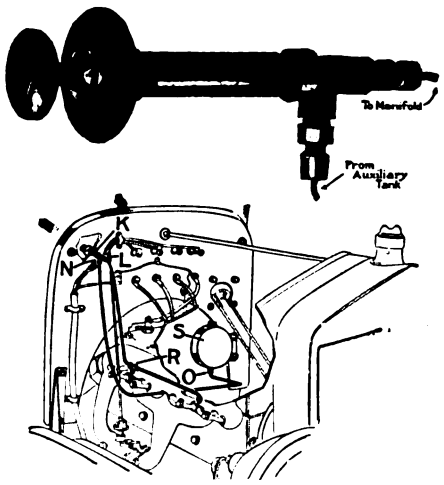
adapted to dry cells, a three-volt equipment operating it with two candlepower lamps. Four candlepower bulbs are used on a battery circuit.

Freeze-Proof Prevents Freezing.

With the approach of cold comes the need of use of an anti-freezing solution in the cooling system of the car. The practical preparation is one that

Digitized by Google

does not injure the rubber, is free from electrolytic action and rust, and does not lower the boiling point of the water. S. C. Johnson & Son, Racine, Wis., is marketing a preparation called Freeze-Proof, and as the name implies it prevents freezing of the water



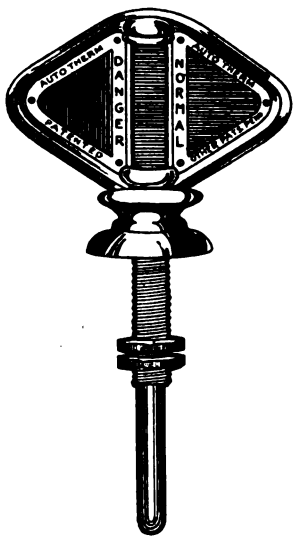
The "J. H." Tonneau Windshield Affords the Convenience of the Open Car with the Comforts of the Enclosed Vehicle.

and is harmless. The boiling point of the solution is from 235 to 250 degrees Fahrenheit, and when it is considered that water boils at 212 it will be seen that the solution can be utilized in mild weather. The preparation is easily used, being poured into the radiator where it dissolves. The solution can be so used as to prevent freezing at very low temperatures. One application is held to be sufficient for the winter as its efficiency is not affected by heating.

New Ford Cylinder Head.

A new cylinder head for the Ford car and which is said to resemble to a great extent the cylinder head of the Hudson car has been brought out by the Green Engineering Co., 48 St. Clair Street, Dayton, Ohio. The head is constructed with an extra large water jacket holding about half a gallon more of cooling fluid than the Ford design, and this water jacket entirely surrounds the spark plug openings, a method increasing the efficiency of the spark plugs. Another feature is that the greater part of the combustion chamber is directly over the valve while the inside of the head is perfectly smooth. The new

The Imperial Primer Is Improved by Use of a Special Tank for Storing a Highly Volatile Fuel for Priming.



head is adapted to the use of the standard S. A. E. spark plugs and can be installed easily and quickly as there are no special connections, etc.

The Fire Gun.

That it is good insurance to equip the car and garage with a fire extinguisher has been frequently demonstrated. The Fire Gun Mfg. Co., Inc., 17 Battery Place, New York City, is marketing the Fire Gun Fluid Extinguisher which discharges a liquid which when striking the heat, vaporizes into a heavy gas which forms a blanket and extinguishes the flames. The device or container is a positive double acting pump having a capacity of 1¼ quarts. It is held that the contents can be very quickly discharged, that the container is so sturdily made that it will withstand severe abuse, and the nozzle is protected from injury by flanges. The extinguisher comes in two sizes, 1¼ and 1¾-quart capacity, and both can be easily and quickly recharged after use. The extinguisher comes complete with bracket. It is non-freezing and has been approved by the National Board of Fire Underwriters, etc.

"J. H." Tonneau Windshield.

Those who prefer the conveniences of the open touring car with none of its discomforts will find the "J. H." Tonneau windshield of interest. This invention completely protects the occupant or occu-

The Auto Therm Indicates to Driver by Means of Wide Ribbon of Color the Temperature of Water.

pants of the rear seat from wind and back draughts, and one of the several commendable features of the construction is that the glass panels can be arranged or placed as desired. The mounting of the shield is such that it can be easily and quickly swung and folded. As may be noted by the accompanying illustration the shield includes a form of boot or robe-like cover which thoroughly protects the passengers. The "J. H." Tonneau windshield not only affords protection but is easily installed. It is marketed by the "J. H." Tonneau Windshield Co., 1777 Broadway, New York.

New Priming Method.

The use of a highly volatile fuel makes starting a cold engine easy and to permit use of the fuel th Imperial Brass Mfg. Co., 12 West Harrison Street, Chicago, Ill., has brought out an improvement to its well known priming device. It consists of an auxiliary tank located as shown at P in the illustration, and this is employed to carry the supply of high test gasoline. Formerly the main fuel supply line was tapped to obtain the fuel. The new method is a big improvement in that it permits of the use of the highly volatile fuel for starting an engine

Digitized by Google

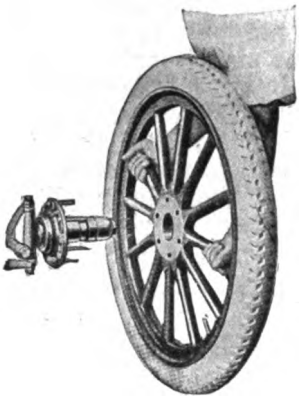
in cold weather. The pump and connections of the primer are practically the same. The device sprays fuel into the intake manifold and is made for all types of cars.

Heating Indicating Device.

The temperature of the cooling fluid in the radiator indicates whether the engine is operating efficiently as well as denotes overheating and too low a temperature. The H. & M. Mfg. Co., 16 Mulberry Street, Newark, N. J., has brought out a device termed the Auto Therm, a heat indicator which operates directly in contact with the water in the radiator, and when the temperature of the fluid rises above normal a danger signal is flashed by means of a broad ribbon of colored fluid contained within the device. The Auto Therm is attached to the radiator cap, is easily and quickly installed, and is made for all standard cars. It also comes supplied with fraternal or patriotic emblems at an additional cost.

The Utility Heater.

The Hill Pump Valve Co., Archer Avenue, Chicago, Ill., maker of the well known Utility heaters for motor cars, has brought out a greatly improved



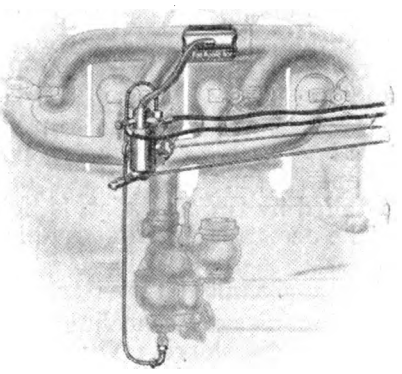
The Utility Heater Provides Comfort in Cold Weather and a Design Is Now Made for the Front Compartment.

design for the coming season. The same principle as formerly, that of using the heat of the exhaust, is employed, but a new exhaust pipe has been added and which fits several different sizes of pipes. The company is also marketing a new design called the Utlity Jr., protected heater, a type made especially for providing comfort for the driver and which is located in the front compartment. This design can also be used in the rear of the Ford, Chevrolet, Maxwell, etc. The heater differs from the Utility in that it is 17 inches long instead of 29. The same workmanship and material are included. The heater includes a foot rail which radiates the heat which can be regulated as desired by a valve.

Demountable Wheel and Carrier.

The changing of a tire in cold weather is not an agreeable task. This is made easy when the car is equipped with demountable wheels. The J. P. Gorham, Co., 47 West 42d Street, New York City, is marketing a demountable wheel for Ford cars called the Anthony that has several commendable features. It permits of making a tire change by removing six nuts, slipping off the wheel, and replacing it with the spare member with its tire. This can be done in a few minutes. The old wheels are utilized and none of the Ford parts are changed. New flange segments

The Anthony Demountable Wheels and Wheel Carrier.



are installed, and the outfit includes four wheel changes, an extra wheel, spare wheel carrier and wrench. The carrier locks the extra member, preventing theft of the shoe.

Vitalizer Heats Fuel.

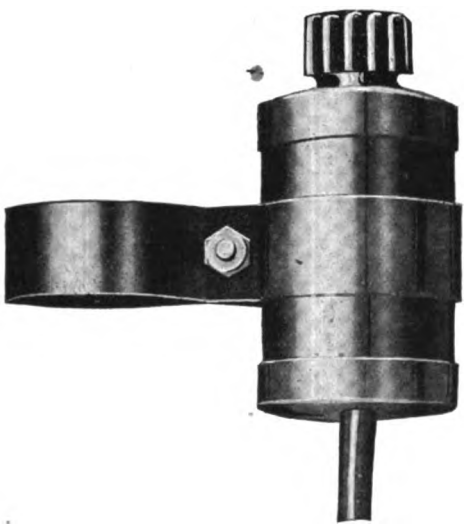
It is a well known fact that in cold weather the fuel will vaporize much more quickly if heat is utilized. This makes starting a cold engine an easy matter. The American Spring Tire Co., 30 West Lake Street, Chicago, Ill., has brought out what is termed the Perfection Five-in-One Vitalizer which can be installed on any engine. It combines an electric heater, primer, accelerator and decarbonizer, and the temperature of the fuel is quickly raised by the electric heater which is controlled by a switch. Not only does the device make starting easy but it is claimed that greater mileage and increased power are secured.

Bill Spark Retarder.

The Bill Mfg. Co., La Porte, Ind., is marketing an automatic spark retarder which avoids the possibility of a backfire through an advanced spark. The operation of the device is simple. When the starting crank is engaged the spark is automatically retarded, but after starting and disengagement of the

The Vitalizer Combines a Number of Useful Devices Including Means for Electrically Heating the Fuel for Starting.

starting crank, the spark is advanced to that position obtained by the original setting of the spark lever on the quadrant of the wheel.



Digitized by Google

Copley Primer.

The Copley primer marketed by the Bay State Pump Co., 100 Purchase Street, Boston, Mass., differs from the usual primer in that use is made of the principle of a small stream of air travelling at high velocity to pulverize the fuel. The fuel is taken from the main supply line and the pulverizing action occurs in the intake manifold. This action is continuous until the pull knob controlling the device is released. It is claimed that the success of the primer does not depend upon the carburetor; in fact, it is stated that the primer will supply the engine with fuel without the carburetor.

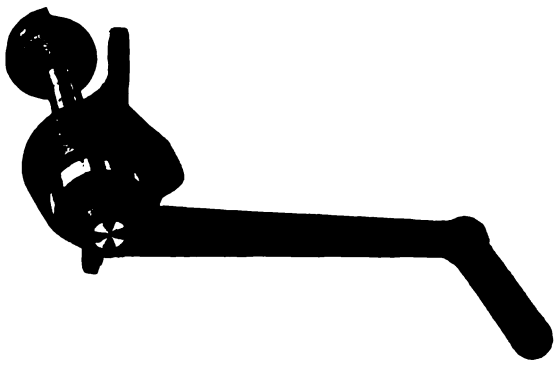
Lite-A-Ford.

Made by the Hastings Mfg. Co., Hastings, Mich., and distributed by the Zinke Co., 1323 Michigan Avenue, Chicago, Ill., the Lite-A-Ford for providing the maximum of light from the headlights will interest Ford owners. By turning a knurled knob any variation of light may be obtained. The dimming feature is secured by a series of resistance coils, but at low engine speeds when the maximum light is desired, the light is made brilliant through the use

The Lite-A-Ford, a Combination Dimming Device and Voltage Regulator at Low Engine Speeds.

of the device. The Lite-A-Ford serves a dual purpose and both are exceedingly useful.

Kickless Crank.



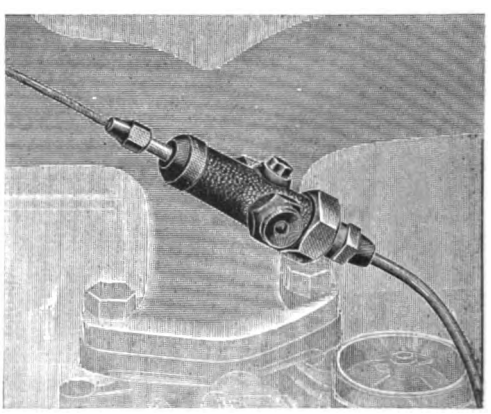
A new device which avoids the possibility of accident when cranking the engine by hand is being marketed by the Carson Mfg. Co., Richmond, Va. It is termed the Kickless Crank and is sold under a forfeit of $100 if the user is injured by it. The construction is simple, has very few parts and these are of hardened steel. The device can be easily and quickly installed by the motorist, is light, and nicely finished. The design is patented and is made for the Ford car.

Celluloid Cleanser.

After continuous service celluloid windows, etc., become dim and discolored. The Celluloid Cleanser Co., 6 Michigan Boulevard, Chicago, Ill., is marketing the C-E-Z celluloid cleanser which is a chemical preparation that is said to restore celluloid. The company is also making Glassocar for treating the glass of the windshield and windows. It is held to prevent frosting of the glass as well as to provide a clear vision in rain, snow, etc.

French Using Alcohol.

According to advices received from France, experience has demonstrated that when alcohol is used in the ratio of three parts to one of gasoline, a very satisfactory mixture is obtained, one that affords flexibility and makes starting a cold engine as easy



The Carson Kickless Crank for Ford Cars.

as with a gasoline mixture. Although the alcohol-gasoline fuel does not require an increase in the oil supply, its use does necessitate that the lubrication system be carefully watched; that is, with the splash or combination splash and force feed that the maximum level be constantly maintained.

Big Tire Mileage.

Among the many creditable tire mileage records which Goodyear cord tires have established, the one which is reported by J. W. Dieffenderfer, of Collingswood, N. J., is of special interest. He states that he has run his Hupmobile car 8,050 miles in a period of two years with no tire mishaps, other than a puncture from a roofing nail, on the 5,200th mile. The other three tires have not been off the wheels or deflated.

Dates for the Chicago show have been set for the week of January 26 to February 2, 1918. As in the past, the second of the big national displays will follow the New York show after an interval of two weeks. Delay in making the announcement was

The Copley Primer Makes Use of a High Velocity Stream of Air for Pulverizing the Fuel in the Intake Manifold.

due to some question of the possibility of securing the First Regiment Armory in Chicago, in addition to the Coliseum, but it is said that arrangements have now been completed for housing the show in the two big buildings as usual.

Digitized by Google

GENERAL NEWS OF THE AUTOMOBILE INDUSTRY.

The next Boston show, which occurs March 2-9, will carry with it the sanction of the Motor and Accessory Manufacturers. This is the first time since 1913 that any show other than at Chicago and New York has been sanctioned by the accessory manufacturers.

This sanction means that any accessory manufacturer may exhibit on the same basis as at New York and Chicago. It also means that the M. A. M. is behind the exhibit at Boston. As a result there will be considerably more exhibits at the Hub next March.

No other sanctions of dealer shows have been issued by the M. A. M. and it is stated that if any are to be issued, they will have to be taken up individually as it would not be possible to issue a blanket sanction for all shows. Without the sanction of the M. A. M., accessories can be exhibited in dealer shows only by jobbers or dealers, the manufacturer being prohibited by the M. A. M. rule from doing so.

S. A. E. Plans Winter Activities.

The indications are that the Society of Automotive Engineers will have an unusually busy winter. Among the new moves is the contemplation of winter meetings in Chicago, and presumably at show time, January 6 to February 2. A professional session will be held during one day, and in the evening there will be a "Patriotic Dinner."

Wednesday and Thursday, January 9 and 10, will be the dates of the meetings in New York and during the show week. Wednesday will be "Standards Day." On Thursday there will be three gatherings which will be followed by a dinner in the evening. There will be two special meetings of the society, these to take place during the aviation and motor boat shows. At the present time the membership of the S. A. E. is 2,775. At the next meeting 200 names will be acted upon.

Ford Accessory Show a Success.

The Ford Accessories Exposition, held under the auspices of the National Exposition for Ford Accessories, Inc., at Chicago the week of September 22-29, created considerable interest and was an unqualified success. A large volume of business was transacted by the manufacturers who exhibited, and one of the factors making for success was that a concentrated effort was made to reach dealers, and get them to attend. Nationally known manufacturers were among the exhibitors. It is understood that the show is to be made a permanent and annual feature.

Hyatt Has Record Month.

The demand for bearings is held by some to be a true barometer of business conditions in the automobile industry. The Hyatt Roller Bearing Co. indicates the prosperous condition of the country as this concern had the best month in the history of the company in August.

Will Produce Trucks.

The Amston Motor Car Corp., Amston, Conn., has purchased the assets of the Sterling Automobile Mfg. Corp. of New York, and will build and market a line of commercial cars at the plant at Amston, Conn. The concern will build primarily a 1,000-pound capacity delivery car which is to sell at from $900 to $950. The company will also build a line of roadster, touring and enclosed passenger vehicles. Charles M. Ams is president and general manager of the new company.

Closed Car Shows Popular.

The increasing demand for the enclosed motor vehicle has resulted in a number of dealers' associations deciding to hold an enclosed car show. The Boston Automobile Dealers' Association is arranging for an exhibit, and it will probably be held at the Mechanics' Building or other similar structure. In former years these shows have been held at the Copley Plaza, an arrangement not pleasing to the dealers and makers of custom-made enclosed bodies.

Moon Takes Over Buggy Co.

The Moon Motor Car Co., St. Louis, Mo., has taken over the plant of the Joseph W. Moon Buggy Co. The factory of the Moon company now occupies an entire block and was necessary to complete the plans calling for a production of 20,000 six-cylinder cars which are to be known as the "Thousand Dollar Six."

Denver Space Is Taken.

All space for the show to be held November 12-18 at Denver, Col., under the auspices of the Automobile Trades Association has been contracted for. Forty-five passenger dealers will display as will 33 accessory concerns. Dealers will feature commercial cars during the show week by holding special exhibits at their display rooms.

Raise Price of Fords.

According to advices from Detroit the Ford Motor Co. has raised the price of Ford cars by $5 by making an additional charge of this amount on all machines for delivery. This increase has been made to dealers, who in turn extract the five from the purchaser.

New Goodyear Record.

A new record was established by the Goodyear Tire & Rubber Co., Akron, O., for business transacted during the month of August. It was the largest for any one month, it amounting to $12,577,000. Officials of the company predict the year's business will total $100,000,000.

Ford Tractors Delayed.

Owing to the large contract with the English government Henry Ford & Son will be unable to supply the American market for some time. The first tractor to be produced in this country will be sent to Luther Burbank in California.

A Hustling Concern.

To make deliveries within three months after organization is the record of the Carlisle Cord Tire Co., New York City, this company having begun deliveries from its factory in Andover, Mass.

A Chevrolet Tractor?

According to advices from Washington the Chevrolet Motor Co., Flint, Mich., is to engage in the production of tractors. The government is to allow certain parts made in the Canadian factory of the company to be admitted free of duty in this country.

Digitized by Google

WHAT IS TAKING PLACE IN THE COMMERCIAL CAR FIELD.

Freight conditions throughout the country have handicapped the railroads to a great extent and this congestion will grow worse as the plans for the final mobilization of the army for oversea service are completed. Lack of transportation facilities has forced shippers to use other means than the railroads, and in their urgent need they have turned to the motor truck as the only available medium for relief. The economic demand for food conservation has led to the greater use of the commercial car through the release of horses and mules, as it takes the produce of 37,000,000 acres of land to support the horses and mules in this country.

Due to the war all these things are being brought to light and are pointing the way to wider uses to which motor trucks can be put and the numerous other conditions that will be relieved through their use.

With the proposed use of trucks the natural question of cost of operation enters into the discussion. How well and easily this question can be solved is best illustrated by the following instance:

The Cheyenne Creamery Co., Cheyenne, Wyo., have until recently been using horses to do their hauling. Through actual experience and statistics kept over a long period of time their records show that their horses cost them exactly $44 a month. This was due to several reasons, principally the high cost of feed. One day they were prevailed upon to purchase a Smith Form-a-Truck. Since that time they found that the truck could do the work in a quarter of the time that it was possible to do it with horses and could relieve the driver for other work. The actual net upkeep of the truck has been less than $14 a month, showing a net saving of $30 a month in addition to many other advantages.

It can be seen from this that in spite of the many other reasons for an increasing wide use, the cost of operation alone is sufficient reason for anyone to change to motorized delivery.

New Army Motor Kitchen.

A New Haven, Conn., hotel man has invented and constructed a kitchen for service on a motor truck, and the equipment was given a thorough test recently when the members of a regiment were fed. It is stated that 6,000 meals a day are possible with the kitchen, and that it has a coffee capacity of 1,000 cups every 10 minutes.

The kitchen consists of a ten-horsepower boiler, two 90-gallon stew, soup or pot roast kettles, and two 50-gallon coffee urns. The vertical boiler utilizes wood, coal, oil or wood. The entire equipment was designed for speed. The kettles and urns are steam jacketed, and in a test recently 50 gallons of coffee were made in nine minutes. Not only is steam utilized for cooking, but it is also employed for sterilizing the mess tins of the soldiers.

The body consists of a roof and flare boards which drop down to serve as a platform. The outfit is mounted on a four-ton Riker truck chassis. Over good roads the estimated speed of the unit is fifteen miles an hour. Weight is about nine tons.

The unit is designed to accompany or precede a battalion on the march. Hot food is ready when the battalion halts, as the food can be cooked while the unit is moving to the place selected for the stop. When the battalion entrains the kitchen is put on a flat car and is just as serviceable there for cooking as on the road. The invention has been given the name of the Taft Army Field Kitchen.

Getting Ready for Jersey.

Forms and printed matter to be used in connection with placing the new laws controlling the use of commercial cars in New Jersey, and which goes into effect January 1, are being circulated among the trade and owners. Greater fees and a drastic regulation of tires are among the features of the bill. It is rumored that motor truck interests are not satisfied with the law and that the next session of the legislature will see an attempt made to modify some of the objectionable sections. A strong and active organization of truck users, owners, dealers, etc., has been formed to combat adverse legislation and as the membership is over 1,000 it is reasonable to assume that results will be obtained.

There have been several conferences between the representatives of the motor truck interests and Commissioner Dill of the Motor Vehicle Department of New Jersey. The strict enforcement of the new tire requirements at one time threatened to result in a serious controversy, but it was averted by Commissioner Dill ordering that all trucks now in service be exempted from the section.

Eliminate Local Delivery.

So rapidly has business increased that the express companies of New York City have been forced to do away with the greater part of their local hauling or delivery. This condition is largely due to the demands created by the war, and delivery from one section of the city to another has been taken over by local express companies. Those concerns owning commercial cars are reported to be doing an enormous business and are able to obtain record prices because of the existing conditions. This has boomed the sales of trucks in New York.

New Truck Unit.

A recent entrant in the commercial car field is Graham Bros., Evansville, Ind., which concern is marketing a complete truck attachment unit called the Graham Bros. All-3 Unit-Cab-Body. It fits the Ford chassis and comes complete for attachment, and choice is given of either an express or stake body. The wheelbase is increased to 125 inches, the carrying capacity is 2,000 pounds and the weight without body is 2,150 pounds. Drive is by chain. The road speed is from 12 to 20 miles. Special bodies are supplied.

Will Build for Government.

According to advices from Indianapolis, Ind., the Premier Motor Corp., has received a contract to build $15,000,000 worth of four-wheel drive trucks. The cars will be built under license from the Four-Wheel Drive Co., Clintonville, Wis.

Steam Trucks Planned.

The Doble Laboratories, San Francisco, Cal., is completing for production a two-ton Doble steam truck. This model will be followed by a 1,000-pound utility chassis and a 3½-ton truck.

To Use Continental Engines.

The Muskegon factory of the Continental Motors Corp. is to construct two sizes of truck engines and in accordance with the standardized government specifications for trucks of the United States army.

Digitized by Google

Natural Gas as a Fuel.

Among the sources of fuel supply, and one that is not generally known to the average user of gasoline, is natural gas. This industry is one of considerable size, having contributed something like 104,212,809 gallons of fuel in 1916. It has increased its production over 59 per cent., or in other words, 38,848,144 more gallons were produced than during 1915.

The amount produced or raw gasoline extracted from natural gas, includes that produced by the compression and absorption methods, as well as that obtained by the use of vacuum pumps and recovered as drips from gas transmission lines. The quantity of commercial gasoline represented by this output of raw casing-head product, though not susceptible of actual determination, was probably more than 200,000,000 gallons.

To obtain the fuel above referred to required 208,800,000,000 cubic feet, and it is estimated that the average recovery of gasoline per 1,000 cubic feet by all methods in practice is about half a gallon. Other statistics of this industry are interesting. For example: There are now 594 plants engaged in this work; that is, there were that many at the end of 1916. This represents a gain of 43 per cent. The average daily capacity of all plants, combined daily capacity, has increased about 108 per cent., or from 232,336 to 484,448 gallons. From these figures it is very evident that the natural gas gasoline industry is a factor in the production of fuel for internal combustion engines.

To Display Fuel Prices, Etc.

When the New York State Automobile Association held its convention recently it adopted a resolution recommending legislation compelling dealers to post conspicuously the price, quality and make of all gasoline offered for sale.

Other proposed legislation approved would make it impossible for road contractors to close roads without first having provided convenient and suitable detours, provide that both sides of a highway may not be covered with oil at one time unless that oil is suitably covered, render it impossible for any cities or incorporated village except New York City to adopt local speed ordinances, or provide for the licensing without examination or fee of all automobile drivers and make it obligatory for the names and addresses of automobile owners to be furnished by the Secretary of State and the police to automobile clubs when request is made through proper authorities.

The convention also recommends that the State police be called upon to enforce the law requiring all vehicles to display lights at night.

Calls Off Used Car Show.

The Automobile Trade Association of Washington, D. C., has called off the proposed used car show. This is due to the fact that dealers report they have been unable to keep a sufficiently large supply of used machines to enable them to hold a show.

Now It's Connecticut.

It appears that Connecticut is to enforce a law compelling motorists to carry mirrors or reflectors when the top of the car is raised or the machine has an enclosed body. The Commissioner of Motor Vehicles has called the attention of the police to the violations of the law, but the police are in doubt as to the exact meaning of the law passed at the last legislature and which applies to mirrors on motor cars.

City Tests Lamps.

The officials of St. Louis, Mo., believe in co-operating with the motorists in the matter of proper lighting equipment. The street commissioner has invited motorists to visit the City Hall and have their lights tested. All approved lamps are to be marked with a small red disc pasted on the glass of the lamp, and the disc is to be varnished over. The city officials are to do away with glaring lights and laws are to be strictly enforced.

Fuel Supply Sufficient.

The supply of crude oil for the production of gasoline and lubricating oil is sufficient for the next five years, providing the production of crude is kept up as at present, but while the situation with regard to the gasoline supply or the crude either is not grave, it does demand very serious consideration, says A. C. Bedofrd, of New York, president of the Standard Oil Company of New Jersey.

Cars Increase in Wisconsin.

Wisconsin has issued 160,000 licenses up to September 1, which is 10,000 in excess of the highest estimate made at the beginning of the year. The gain over last year is 40 per cent. There has been a corresponding increase in the number of licenses issued to dealers despite the fact that agency lines have been more strictly drawn everywhere.

Republic Trucks Increase.

Indicating the increasing demand for commercial vehicles is the report of the Republic Motor Truck Co., Alma, Mich. The company disposed of 12,917 cars for the year ending June 30, an increase of 3,851 over the preceding year.

Sweden Conserves Fuel Supply.

Sweden has issued a royal decree in order to conserve the supply of fuel. According to this decree permission must be obtained from a commission before use can be made of gasoline in any motor vehicle or motor boat.

COMING EVENTS.

Los Angeles, Cal., November 12-17.—Pacific Coast Show, Los Angeles Motor Car Dealers' Association.

Denver, Colo., November 12-18.—Automobile and Accessories Show, Automobile Trades Association of Colorado.

Springfield, Mass., December 3-9.—Show, United Shows Co.

New York, N. Y., January 3-4, 1918.—Quarterly Meeting, Automobile Electrical Association.

New York, N. Y., January 5-12.—National Automobile Show, National Automobile Chamber of Commerce and Motor & Accessory Manufacturers.

New York, N. Y., January 11-16.—Meeting of National Association of Automobile Accessory Jobbers.

Washington, D. C., January 11-18.—Carnival and Open House Week, Automobile Trade Association of Washington.

Montreal, Can., January 19-26.—National Motor Show of Eastern Canada, Montreal Automobile Trade Association.

York, Pa., January 21-26.—Automobile Show, the York Auto Dealers' Association.

Chicago, Ill., January 26-February 2.—National Automobile Show, National Automobile Chamber of Commerce and Motor & Accessory Manufacturers.

St. Louis, Mo., February 11-16.—Show, St. Louis Automobile Manufacturers' & Dealers' Association.

San Francisco, Cal., February 16-26.—Second Annual Automobile Show, San Francisco Automobile Dealers' Association.

Boston, Mass., March 2-9.—Automobile Show, Boston Automobile Dealers' Association.

Digitized by Google

New California Trailer Fees.

After January 1 the California motor vehicle law will have several changes. A charge of $2 is to be made for number plates for trailers. Where more than one is used only the rear one need carry a license plate. Trucks over 9,000 pounds with load are limited to a speed of 25 miles per hour and to 15 miles when the load is 1,200 pounds. When the load is over 24,000 pounds the speed is limited to 10 miles. Trucks using metal tires must not exceed a speed of six miles per hour.

Will Increase Fuel Supply.

Gasoline production in the United States is expected to be considerably increased by a decision of the Standard Oil Company of Indiana to permit unrestricted use of its Burton refining process. Heretofore only the Standard companies and a few independents have been allowed to use it.

The Standard's action was prompted by the present great demand for gasoline, which threatens soon to overtake production. With the Burton process almost twice as much gasoline is obtained from crude oil as under other refining methods.

Conducts Service School.

The importance of service is noted in the plan of the Federal Motor Truck Co., Detroit, Mich., which concern is conducting a three-day school at the factory and teaching service men the fine points of commercial cars.

Portland Welcomes Motorists.

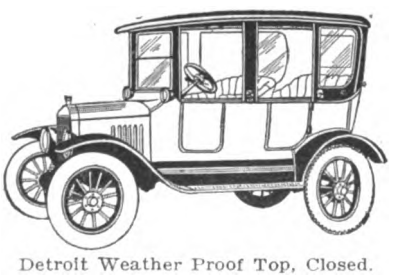
Up in Portland, Ore., the police and traffic officers have been appointed a special committee to welcome automobilists from out of town. If you happen to drive to Portland and an officer stops you as you enter the city limits, do not be afraid. He will merely bid you welcome, offer you information and present you with a convenient map of the city. Other cities please copy.

NEW AND INTERESTING THINGS IN MOTORDOM

A Natural Tightener for Loose Wheels.

A half day in the creek used to be necessary occasionally for loose wagon wheels. Automobiles, however, cannot be given such treatment. So American inventive genius has discovered Spoktite, a preparation that will do the work better and keep the wood swelled longer

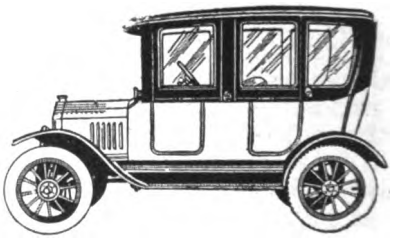
A Can of "Spoktite."



than water and yet do it just as naturally. Motorists will not have to make a mechanical repair of loose spokes. Neither will the car have to be laid up for a day in a blacksmith shop or repair shop. Anyone can tighten loose, rattling spokes in a short time by simply injecting a little Spoktite at the hubs and felloes into the cracks caused by shrinkage. It doesn't take long for Spoktite to penetrate to the core of the wood and it expands every fiber. And it is something that will not evaporate quickly under the hottest sun. This popular preparation is made by the Liquid Wheel Tightener Co., Modesto, California, who state that Spoktite will tighten wood of all kinds and in all places. It will tighten loose furniture, floors, tool handles, implements, etc. And one of its best features is its ability to stop body squeaks for vehicles of all kinds. There was a great demand for it last summer, but the manufacturers expect it to be many times larger after the first time buyers have used it successfully on household articles as well as auto wheels. Spoktite is sold in containers of four different sizes. The ½-pint can, selling at a dollar, is enough to tighten four wheels. It has a handy spout attached for application. The other cans hold respectively, one quart, a half-gallon, and a gallon. The Liquid Wheel Tightener Co. will be pleased to answer any inquiries about Spoktite. Most of the garages, hardware stores and auto supply stores carry it in stock ready for use.

New Era Removed to Grand Rapids.

The New Era Spring & Specialty Co. is discontinuing its main sales office at Detroit, Michigan and establishing its general headquarters at their Grand Rapids, Michigan, factory. This will enable them to keep in closer touch with manufacturing conditions at the plant.



Detroit-Weatherproof Detachable Top.

This top which is illustrated herewith is manufactured by the Sharer Patent Top Co., 239 W. 56th Street, New York City. Motorists nowadays demand equipment that is available and suitable twelve months out of twelve. Inclement weather conditions must be overcome and

Detroit Weather Proof Top, Closed.

protection is demanded against rain, storm and cold. The two illustrations show this top open and closed. The manufacturers claim that this is the only all-weather top that entirely eliminates the objectionable features of a detachable top and affords the car owner an enclosed or open body at a yearly low price. The specifications of this top include patented flexible sliding doors which disappear instantly into the roof with no glass to rattle or break. Thus any amount of desired ventilation can be secured with full freedom for traffic signaling. All four of the doors can be opened in a few seconds. The Detroit Weatherproof Tops are extremely light, weighing only approximately 50 pounds. They are absolutely non-rattling and can be attached while the driver waits and they do not deface or mar the car when

Detroit Weather Proof Top, Open.

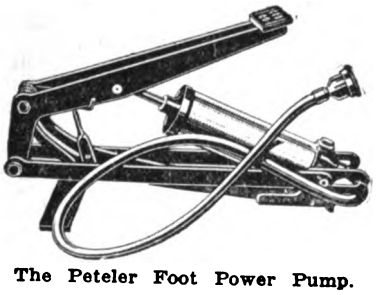
detached. These tops are exceedingly well finished, the exterior being of a strong, durable, long-wearing special material and the interior lining and trimming of durable limousine cloth. These tops are also low in price and easily within the reach of any car owner. They enable the Ford owner to convert his car into an all-year-round automobile, neat and handsome in appearance. For prices and full particulars, write direct to the manufacturers, the Sharer Patent Top Co., 239 West 56th Street, New York City.

Keeping Tab on Dealers' Sales.

The Tuthill Spring Co., of Chicago, Illinois, have an interesting way of calling their jobbers' attention to the business they are doing on Tuthill springs. Each month they send them a "graph," which tells at a glance the business done and how it compares with the monthly records of the previous year and a half. This is a system which jobbers could use in keeping track of their dealers' business and which other manufacturers could use to a good advantage.

Digitized by Google

Two-Three Tire Carriers.



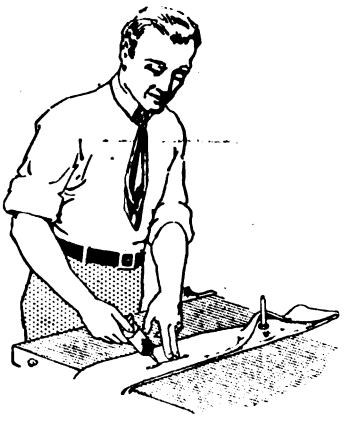
A new line of tire carriers will be placed on the market for the season of 1918 by the International Stamping Co., 400-412 North Leavitt Street, Chicago, Illinois. This company calls special attention to what they call their Two-Three tire carrier, which will enable any car owner to carry all the extra tires desired as a regular proposition or for special trips only. Assuming that the car owner has provision for one extra tire, this carrier rests upon and is supported by tire No. 1, it in turn will support tire No. 2 and No. 2 will support another carrier for tire No. 3, thus making it possible to carry almost any number of extra tires. Readers who are interested should write for full particulars direct to the manufacturer.

The Knudsen Packless Swivel Joint.

There has recently been placed on the market a new swivel joint for use in steam, air, gas and ammonia lines, requiring no packing because the cast iron spring (cast iron being used in this case as it is for the manufacture of piston rings) permanently seats the joint and therefore eliminates the cost and annoyance of repacking the joint. It follows, of course, that the cost of rubber or metallic hose serving as a conduit for steam, air, gas and ammonia is cut down in proportion to the cost of a permanent iron pipe line. That the Knudsen packless swivel joint makes it possible to use common iron pipe for a permanent and flexible line is now illustrated in hundreds of installations in various branches of industry. This specialty is made by the Universal Valve Co., Burlington, Wisconsin.

Peteler Foot Tire Pump.

This excellent device for pumping tires is illustrated herewith. This pump is sound in construction, is extremely simple in design, and anyone who has pumped up tires by the old hand method, knows how much easier it is to do this pumping with the foot, as of course, the weight of the foot assists materially in the operation, where foot power is used



The Peteler Foot Power Pump.

instead of hand power. No loss of efficiency can occur in the Peteler foot tire pump, owing to its peculiar construction. This pump is guaranteed to be made with best workmanship, extremely durable, and guaranteed to give 100 per cent. efficiency. Readers who are interested should write direct to Moreau & Pratt, Inc., 1834 Broadway, New York City.

Para Rubber Products Company Specialties.

The Para Rubber Products Co., 27 William Street, New York City, is manufacturing several valuable specialties for the tire trade and for the use of car owners in the care of their tires. They call special attention to the self-vulcanizing material which they manufacture. The product of this company called Vulcanizit will form a tough elastic rubber weld over cuts, tears and holes in inner tubes. Another compound manufactured by the same company called Kutfiller is designed for use on automobile shoes to fill cuts, tears and sand blisters. If used in time, Kutfiller will prevent blowouts. It can also be used to cement down a torn flap. Both Vulcanizit and Kutfiller come conveniently packed in

Method of Applying Vulcanizit.

collapsible tubes and the illustration shows a workman using Vulcanizit for the repair of an inner tube. The same company also manufactures Tiretrim, a liquid rubber tire dressing, and Toptrim, a dressing for mohair tops and cushions which renders any fabric top absolutely water-proof. The dealers, repairmen and garage owners who may be interested in this product should write for prices and full particulars to the Para Rubber Products Co., 27 William Street, New York City.

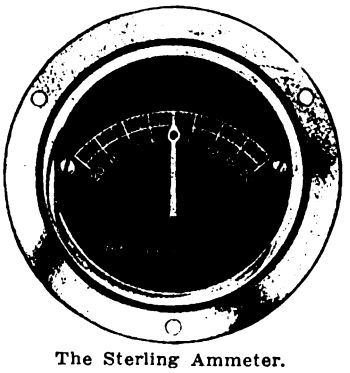
Kimball Tires.

Dealers throughout the country are taking considerable interest in the new Kimball tires, which are marketed by the Kimball Tire & Rubber Co., Dept. 18, 1473 Michigan Avenue, Chicago, Illinois. The line of Kimball tires includes the Kimball button-grip, the Kimball bar-grip and the Kimball cord-type tire. Good quality together with low prices have made these tires a quick selling proposition. Dealers should consult the price list published by this company in their attractive full page advertisement in this issue.

Steer Warms for Winter Driving.

Dealers who are considering quick selling winter specialties should not forget the very clever device called Steer Warms, an invention for enabling drivers to be comfortable in severe winter weather. Every one who drives a car knows that the hands get very cold and stiff even if the mercury is only a little below freezing point, and in zero weather the trouble from cold hands is almost unbearable. Steer Warms are applied directly to the steering wheel at the points grasped by the driver and a uniform heat is furnished, making driving just about as comfortable as it would be in summer. Steer Warms are not expensive. For all gasoline cars the price is $7.50 per pair, and in Canada $11.00; and special Steer Warms for Ford cars sell in this country for $5.00 and in Canada for $7.25. The wholesale price on Steer Warms is such that any dealer can make an excellent profit, and the manufacturers also furnish advertising aids and practical sales suggestions to dealers, which make it easy to sell the goods. Readers who are interested should write for prices and full information to the manufacturers, the Interstate Electric Co., 845 Perdido Street, New Orleans, Louisiana.

Wayne Enlarges Plant.



The Wayne Oil Tank and Pump Co., of Ft. Wayne, Indiana, is greatly enlarging its plant. Three additions have just been completed, doubling their present floor space. Four acres have recently been purchased immediately west of the main office building and will be used for an addition to the heavy metal tank shop. J. B. Beall, formerly factory sales manager, will have charge of a new branch office at Cleveland, Ohio; and J. D. Rauch, formerly treasurer of the American Steel Dredge Co., of Ft. Wayne, is the new factory sales manager. Both changes became effective September 1st.

Continental Accessories.

The Continental Auto Parts Co., of Knightstown, Ind., makes a line of specialties which are very attractive. This line includes the Continental foot rest, the Continental motor stand for repair shops and the Continental steam vulcanizer for car owners. This is a quick selling line which ought to interest a great many of our readers who should correspond directly with the manufacturers, who will gladly furnish literature, prices and full particulars in regard to all these specialties.

The Sterling Ammeters.

This instrument which is illustrated herewith is especially constructed for automobile use. It is of the permanent magnet and moving vane type having a wide, clearly defined dial and broad pointer. It is beautiful, accurate and

The Sterling Ammeter.

durable and is described by the manufacturers as the latest product of 11 years of successful meter making experience. Readers should write for prices and particulars to the Sterling Manufacturing Co., 321 Frankfort Avenue, Cleveland, Ohio.

Lite-A-Ford.

In calling attention in our last issue, on page 80, to Lite-a-Ford, giving some particulars concerning it, the address of the manufacturers was inadvertently omitted. This article is manufactured by the Hastings Mfg. Co., 209 Michigan Avenue, Hastings, Michigan.

JOHNSON'S CARBON REMOVER

Cures 80% of Engine Trouble

A dose of Johnson's Carbon Remover—The Engine Laxative—will make your motor run like it did the first 500 miles—quietly and full of "pep"—And your gasoline consumption will drop from 12% to 25%. You will save from $3.00 to $5.00 over any other method.

You Can Take the Hills on High Without a Knock

if you will keep your motor free from carbon with

JOHNSON'S CARBON REMOVER

That knocking in your engine—difficulty you have climbing hills—poor pick-up—pre-ignition and lack of power will all be overcome.

You Can Do It Yourself

For 25c—five minutes' time—and with no labor, you, yourself, can remove all carbon deposits. Pour an ounce of Johnson's Guaranteed Carbon Remover into each cylinder—allow it to remain two to twelve hours, then drive your car 10 or 15 miles. Results will surprise you.

Use It Every 1,000 Miles

If you will use Johnson's Carbon Remover at regular intervals, giving carbon no chance to accumulate, you will eliminate most valve trouble and your engine will always be at its highest efficiency.

If your dealer cannot supply you with Johnson's Carbon Remover, use attached coupon.

Write for our folder "Keeping Your Car Young"—it's free.

$1.00 Special Offer $1.00

S. C. JOHNSON & SON, Dept. AD10, Racine, Wis.

I enclose $1.00 for which please send me by prepaid express enough Johnson's Guaranteed Carbon Remover to thoroughly clean an ordinary four-cylinder motor four times.

JOHNSON'S PREPARED WAX

Now Made in Liquid Form

We are now making Johnson's Prepared Wax in ***Liquid Form*** as well as Paste—so that it may be more easily polished. Johnson's Prepared Wax ***Liquid*** is exactly the same as our Paste Wax except that it is a liquid. Apply with cloth, brush or spray.

Is Your Car Dirty, Grimy and Unsightly?

DO you know that you, yourself, can make it look almost like new and save the cost of revarnishing? All you need is Johnson's Cleaner and Johnson's Prepared Wax ***Liquid.***

JOHNSON'S CLEANER

entirely removes all stains, scum, road-oil, tar and grease from body, hood and fenders. It doesn't injure or scratch the finest varnish—simply cleans and prepares it for the Wax polish.

Absolutely Dust-Proof

Johnson's Prepared Wax Liquid gives a hard, dry, glasslike polish which does not collect or hold the dust. It preserves the varnish and protects it from the weather, adding years to its life and beauty. It covers up mars and scratches—prevents checking and cracking—sheds water and makes a "wash" last twice as long.

Johnson's Prepared Wax Liquid is very easy to use—it polishes instantly with but very little rubbing. You can go over a good sized car in half-an-hour.

Quarts.....$1.40 Pints.....$ .75
East of the Rockies

If your dealer cannot furnish you with Johnson's Automobile Products, we will pay the expressage to any point in the United States east of the Rockies.

Write for our folder "Keeping Your Car Young"—it's free.

Presto Display Wins Blue Ribbon.

The Metal Specialties Co., Chicago, Illinois, manufacturers of the Presto line of accessories, was the winner of the Blue Ribbon, the highest award at the National Exposition for Ford Accessories, for the "most complete and easily understood exhibit." The articles were grouped in a comprehensive and attractive manner, on wooden and plush panels, which made a handsome background and gave clear prominence to the various accessories. The articles that were closely related to each other were displayed upon the same panel. The cigar lighters and the inspection lamps were exhibited together. The dash lamps and cowl lamps were shown in a careful and pleasing design. The electric engine, radiator and carburetor heater occupied a panel on the counter, and the allweather protector and tire tool were given places of prominence by themselves. Great care was expended in arranging each panel and when the individual board had been worked out into an attractive design the whole series was arranged in an excellent picture. The thoroughness, the beauty, and the ease with which the display could be understood, earned the Presto exhibit the highest honor. The value of such a display was proven by the Metal Specialties Co., for they had the distinction of making the first sale at the Exposition, an order amounting to $1,000. There were many interesting and beautiful exhibits, but it was agreed by authorities that the Presto display fulfilled all requirements for the Blue Ribbon.

Blue Ribbon Winning Exhibit at Accessory Show.

Largest in the West.

Indianapolis, Indiana, is able to boast of the largest cylinder regrinding establishment in the Middlewest, the Butler Mfg. Co., of 1124 E. Georgia Street. This concern is not only the largest of its kind in its own section, but the new equipment which it is installing this fall will make it the second largest in its field in the whole United States. This company is growing not alone because of the excellence of its service, but because the regrinding of automobile cylinders and the fitting of new oversize pistons is a rapidly growing practice. This regrinding of the cylinders changes an engine which is a weakling, one which is losing power and wasting gasoline and oil, into an engine which is practically new; that is, insofar as the cylinders and pistons are concerned, with an abundance of compression and pep, and a noticeable decrease in operating expenses. Butler Mfg. Co. is not a local concern. During the last week in July it shipped out orders to ten different states in the union, not including shipments to a large number of points within Indiana itself, and in addition, shipments to Canada and for export. Inquiries for information and prices have come from as widely scattered places as Japan, New Zealand, South America and Europe. All of the work of Butler Mfg. Co. is done to its own standards, all of which have been developed and tested through years of patient study. Freak ideas are avoided and sound progressive lines alone are adhered to. Complete measurement records are kept of all orders of cylinder, piston and wristpin work, so that information can be furnished, or duplicate parts promptly supplied to the customer. The company believes in giving honest, intelligent service, and its wide clientage proves that it lives up to its belief.

A Live Proposition for Dealers.

The Krom-Nik Gear Company, 910 S. Michigan Ave., Chicago, Illinois, is sending out a circular to call the attention of live dealers to the advantages of selling M. & S. differentials for replacement on Ford and Chevrolet cars. Nearly every day a customer is likely to come along who wants a gear replacement; and the dealer and repair man who is in a position to supply this demand is sure to make considerable extra money. The Anderson rolled gears made by this company are guaranteed to fit Ford cars. They are also guaranteed in a general way as to workmanship and material and the manufacturers claim that they will actually last longer than cut gears. The M. & S. differentials for Ford rear axles have deservedly received much attention from the trade and there is a large sale on this specialty throughout the country. This differential meets Government specifications. There is nothing freakish in its construction, as it is a true differential with spiral gears which all engineers agree are necessary for differentiation of power, and which can only be secured through a series or chain of gears. It is claimed that the installation of this differential on a Ford car will eliminate all future repair expense to this portion of the car. Readers who are interested should write to the main office of the Krom-Nik Gear Co., 910 S. Michigan Ave., Chicago, Illinois, for prices and full particulars also terms to dealers. Many of our readers should be interested in these quick selling specialties.

New Demountable Felloe Band.

The Hood Tire Co., Inc., Watertown, Massachusetts, will place on the market for the season of 1918, a new demountable felloe band for solid rubber tires. Every truck owner knows the loss of time incurred when his truck must be laid up to change tires. The trips to and from the service station and the time necessary to change the tire represent to the truck owner time wasted. With this new self-contained demountable felloe, the truck driver can change his own tires just as a pleasure car owner changes his demountable pneumatic tire rims. This change can be easily and quickly made, anywhere and at any time, without removing the wheels. Such an invention will undoubtedly be greatly appreciated by truck owners; and we believe this device will command a large and ready sale in the trade.

Automobile Reference Books.

We wish to call the special attention of our readers to an excellent reference book on automobile engineering which is published by the American Technical Society, Dept. A-7557, Chicago, Illinois. This work is in five volumes, containing a total of 2400 pages of reading matter and 2000 illustrations, tables and diagrams.. This book is exceedingly useful for every dealer, garageman, repairman or car owner. The volumes are flexibly bound in genuine morocco leather, gold stamped. There are almost two entire volumes devoted to ignition, starting and lighting systems, with a great many wiring diagrams. Every conceivable mechanical subject is treated in this work, and it is sold on a basis of 50 cents per week until the entire price of $17.80 for the five volumes has been paid. This work will also be sent for seven days free examination to any reader who will fill out and send in the coupon which appears in this issue attached to the advertisement of the American Technical Society.

Removal Notice.

The Hartford Tire & Rubber Co., well known New York tire dealers, has moved from 149 West 51st Street to a much larger and better store at 238 West 56th Street. In the new store this company will have 3000 square feet of floor space right in the automobile center.

Cork Inserts Stop the Slip

ADVANCE
CORK INSERT
TRADE MARK REG. COPYRIGHTED 1917
TRANSMISSION LININGS FOR FORDS

They Stop the FORD Jarring and Chattering

They make the Ford Brake BRAKE!
They outlast 3 sets of ordinary linings

When Cork Insert Transmission Linings go on a car, smooth, positive, quiet transmission action begins. They end those noisy, chattering stops with the car shaking like a tree in a gale. They stop those jarry, jumpy get-aways. They eliminate those lurchy reverses.

Here's why: the jumping, chattering, lurching, is caused by faulty transmission linings. Ordinary transmission linings soon get hard and smooth in service. Then they slip when brought into use. That grabbing and slipping causes all the jerking, sets up the noisy chattering, makes the braking action uncertain and slowly but surely junks the car.

Cork Insert Transmission Linings eliminate the slipping—the rattling—the jerking. The corks never get hard or slippery. They give a better driving, better braking car and a lining that greatly outwears ordinary lining.

$3 for set of 3 — Outwear other linings 3 to 1

Order From Your Jobber

Order at least a dozen sets of Cork Inserts next time your jobber's salesman drops in. Cork Inserts mean better profit for you—better service and satisfaction for the user. They are the livest line in the field. Strongly advertised. Your customers know about them. Stock them and they'll move fast. Send coupon if your jobber can't supply you, and get started selling them.

Keeps the Motor Cool by keeping the Fan Fanning

Overheating—that's the biggest bugaboo in motoring. Overheating is largely avoided if the fan can be kept fanning by a belt that don't slip. The slippage of the ordinary Ford fan belt runs as high as 25% to 50%.

Cork Insert Fan Belts don't slip. The buttons of cork—unaffected by water or oil, grease or dirt—grip at the first turn of the motor and keep the fan fanning. They outwear several ordinary fan belts, and do the work better as long as they last.

Holophane Non-Glaring Headlight Lens.

A glareless headlight lens built on the prismatic principle, with the addition of a diffusing shelf or fin, is being manufactured by the Holophane Glass Co., 340 Madison Avenue, New York City. This lens has been designed to comply with the strictest laws, not losing sight of the fact that it is as important to have enough light for the driver to see the road clearly as it is to prevent glare in the eyes of the approaching driver.

As can be seen from the illustration, there are three general types of prisms in addition to the fin. The horizontal prisms at the top bend the light down below the horizontal so that the rays that would usually go up and be wasted, are thrown down on the road. The prisms radiating from the center, bend a portion of the beam down sharply for lighting a wide road area at a distance. Thus, by having prisms designed to

The Holophane Headlight Lens.

do a specific part of the work, a higher efficiency is obtained and results secured that extended investigation into the requirements of scientific lighting, have shown to be necessary.

One exclusive feature of the design is the addition of the diffusing fin that projects back over the bulb and so thoroughly diffuses the direct light from the bright filament, that the glare therefrom is completely eliminated. This method of reducing the glare is most economical, as the thin fin does not interfere with the rays of light coming from the reflector. The manufacturers claim that by keeping the beam of light low (below the 42-inch line) there is no back reflection from rain or dust so that the road can be seen under all conditions. They have been approved by a number of states as complying with the regulations.

Repairing Magnetos.

The magneto can hardly be properly repaired in an ordinary shop. Special technical experience is required for this work, which is exceedingly delicate Hechts Magneto Exchange, 230 West 49th Street, New York City, makes a specialty of this work; and this company may be regarded as the pioneer concern in this line, as they have been repairing magnetos for satisfied customers for several years. This company has just completed its electric starting and generator department by equipping it with the finest Weston electric testing instruments. The agency for the Swiss and Berling magnetos has also been taken over by this Company, and a mail order business is carried on in repairing magnetos. Dealers, repair men or car owners requiring work of this kind should correspond with the Hecht's Magneto Exchange as they may be assured of careful work and reasonable prices.

New Construction of Ez-E-Kleen Spark Plug.

The perpetual Spark Plug Co., Inc., 328-334 E. Drinker Street, Dunmore, Pennsylvania, announce that they have materially changed the design of their Ez-E-Kleen spark plug; also the "Manufacturers Special" plug, the object of the change being to make the spark plug compression tight when heated by the engine. This result is obtained by making the recess of the key-seat inside the metal shell and on the outside of the insulator, locating it close to the soft joint, so that no metal is between the key-seat and the soft joint, to expand from the heat of the motor; thus making a compression-tight spark plug when heated by the motor, as well as when the spark plug is cold. Readers who are interested should write direct to the manufacturer for a complete description of the new plug.

An Improved Magneto and Generator Coupling.

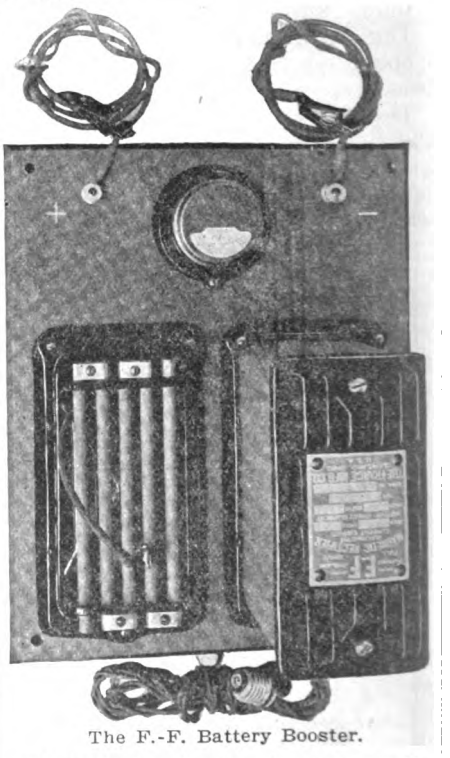
The Climax Motor Devices Co., 5209 Prospect Ave., Cleveland, Ohio, is placing on the market an improved type of magneto and generator coupling in which without disturbing the simplicity of the regular coupling, several additional features have been incorporated which add to the usefulness of the device. This coupling is now doubly universal and flexible, and is designed to allow for every shaft misalignment, whether direct or otherwise. It is also absolutely foolproof as there are no nuts or bolts to be tightened. Readers who are interested should write for free circular, direct to the manufacturer.

"Red Devil" Pliers.

There is no tool which is needed more around an automobile than a good pair of pliers. Smith & Hemenway Company, Inc., 83 Coit Street, Irvington, New Jersey, manufacture the "Red Devil" pliers, a tool which is made of the best material by skilled workmen and one which will appeal to every car owner or automobile repair man. "Red Devil" pliers are made in over 100 styles of drop-forged steel and are stocked by all jobbers. Readers who have not already obtained the catalog issued by this company, should send for one, as it is free for the asking to any dealer or repair man.

The Rex Gasoline Hose.

This is an excellent hose which will appeal strongly to the trade and car owners on account of its peculiar construction. This hose has a core of asbestos packed steel tubing, covered with gasoline proof gum, over which is woven a cotton jacket. This hose is recommended for use in connection with measuring pumps for gasoline and oil, and to those who require service and satisfaction. The couplings are of the compression type, especially designed so that they cannot leak or pull off, also giving full flow without any back pressure to pump. Couplings and hose to fit all pumps are made in several sizes, ¾



The Rex Gasoline Hose.

inch, 1 inch and 1¼ inches and in any length. Packless Anti-Drip Nozzles are also furnished with this hose which is manufactured by the Chicago Tubing & Braiding Company, 216-224 N. Clinton Street, Chicago, Ill.

New Electrical Specialty.

We illustrate a new electrical specialty made by the France Mfg. Co., Cleveland, Ohio. It is called the F-F Battery Booster, with new rheostat control mounted on a panel. The variable carbon resistance unit is a departure from older forms of rheostats and the combination allows all capacity batteries, from the smallest hand lantern and motor-

The F.-F. Battery Booster.

cycle batteries to the largest starting batteries, to be charged at anything from a very low rate up to the maximum output of rectifier of 10 to 15 amperes with 6-volt batteries. The outfit as shown sells for $28.00. If desired the resistance unit is sold separately at $5.00 to be used in connection with the portable type rectifiers, made by this company.

Many Positions Open.

The United States Civil Service Commission announces the following open competitive examinations for positions in the several ordnance establishments of the War Department or in or under the office of the Chief of Ordnance, War Department, Washington, D. C. The salaries named are for entrance.

Mechanical engineer, artillery ammunition, $3,000 to $3,600 year.

Mechanical engineer, experimental work, $2,500 to $3,000 year.

Mechanical draftsman, $1.000 to $1,400 year.

Apprentice draftsman, $480 year.

Inspector of artillery ammunition, $1,500 to $2,400 year.

Inspector of field artillery ammunition steel, $1,500 to $2,400 year.

Assistant inspector of field artillery ammunition steel, $3.50 to $5 day.

Inspector of ammunition packing boxes, $3.52 day to $1,800 year.

Inspector and assistant inspector of powder and explosives, $1,400 to $2,400 year.

Inspector of ordnance equipment, $1,500 to $2,400 year.

Assistant inspector of cloth equipment, $80 to $125 month.

Assistant inspector of leather, $100 to $125 month.

Assistant inspector of small hardware, $80 to $125 month.

Assistant inspector of textiles, $80 to $125 month.

Assistant inspector of leather equipment, $100 to $125 month.

Clerk qualified in business administration, $1,200 to $1,500 year.

Index and catalogue clerk, $1,000 to $1,200 year.

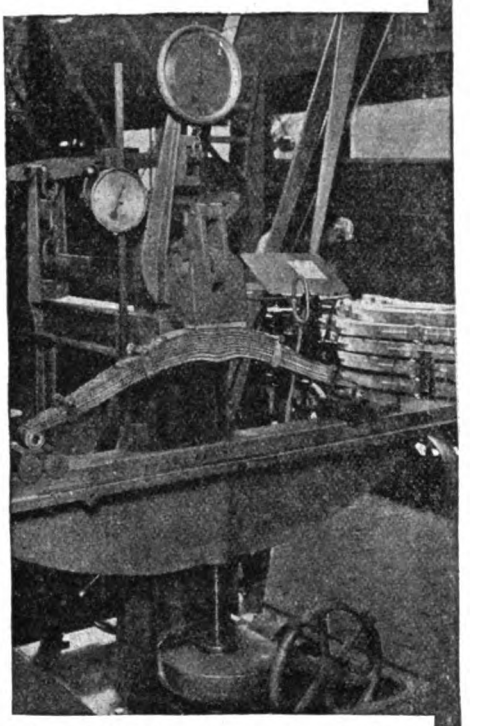
The examination for index and catalogue clerk is open to both men and women; the other examinations are open only to men.

The Government urgently needs men for the work above indicated, and qualified persons are urged, as a patriotic duty, to apply for examination. Until further notice applications for the positions named will be received at any time by the United States Civil Service Commission, Washington, D. C. Papers will be rated promptly. Applicants will not be required to appear at any place for examination, but will be rated principally upon the elements of education, training, and experience, as shown by their applications and by corroborative evidence.

Full information concerning examinations, application blanks, etc., may be obtained by calling in person upon the secretary of the local board of civil service examiners at the postoffice in any city in which city delivery of mail has been established, or by communicating with the United States Civil Service Commission, Washington, D. C.

A new owner who equipped his car with a certain form of demountable wheel, was observed trying to remove a wheel because of a puncture. The wheel refused to budge until a puller was brought into play. An inspection of the wheel indicated rust. If wheels of this type are treated with graphite not only will rust be avoided but the work of displacing them made easy.

Deskroom in a large, modern office automobile can be secured at a very moderate price.



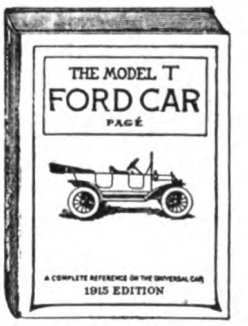
They Stand the Test for Strength

EVERY lot of Tuthill Titanics are tested and *proved* in tensile strength, capacity, alignment and correct temper.

Tuthill Titanic Lubricated Springs

are guaranteed forever against center breakage—guaranteed at all points and in every respect for one year.

No weakening center bolt — no center nib —but a patent flawless arch makes Tuthill Titanics strongest at the center. Easily adapted to any type of axle construction without extra expense. **More replacements are made with Tuthill Titanics than all other makes put together.** A special Tuthill Titanic Front Spring for Fords is now made — carries same guarantee. Get our attractive dealer proposition, and 1917 Price List.



Tuthill Spring Co. (Established 1880)
760 Polk Street Chicago, Ill.

A NEW, COMPLETE BOOK
FOR EVERY FORD OWNER, DEALER, SALESMAN and REPAIRMAN

THE MODEL T FORD CAR

ITS CONSTRUCTION, OPERATION AND REPAIR

By VICTOR W. PAGÉ

Member of the Society of Automobile Engineers,

Author of "The Modern Gasoline Automobile," etc.

300 (5x7) Pages

Over 100 Specially Made Engravings

AND TWO LARGE FOLDING PLATES

Price $1.00

This is the MOST COMPLETE and PRACTICAL instruction book ever published on the FORD CAR. Illustrated by specially made drawings and photographs. All parts of the Ford Model T Car are described and illustrated, in a comprehensive manner—nothing is left for the reader to guess at. The construction is fully treated and OPERATING PRINCIPLES MADE CLEAR TO EVERYONE. Complete instructions for *driving* and *repairing* are given. Every detail is treated in a non-technical yet thorough manner.

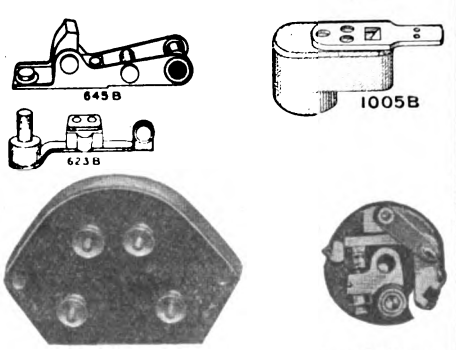
The Permatex Automobile Products.

Constant A. Benoit, M. S., of Sheepshead Bay, New York, manufactures a line of automobile products which must be of interest to a great many of our readers. This line includes Permatex heat resisting gasket cement, which is

Permatex Products, as Put Up for Dealers.
Made by Constant A. Benoit, Sheepshead Bay, N. Y.



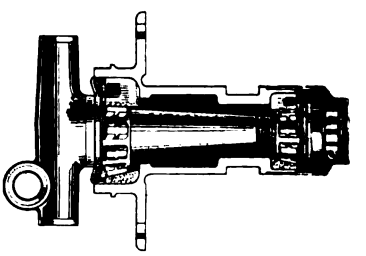
used by many of the manufacturers of automobiles, engines, motorcycles, airplanes, marine and tractor engines in the connecting of various flanged surfaces, such as cylinder heads, carburetors, manifolds, crank cases, etc. This product is guaranteed to be gasoline, oil and water proof. It has no injurious action on the engine and is used on all kinds of paper, asbestos, felt, rubber and metal gaskets, producing a pressure-tight union. It is claimed that this cement will stand five times the temperature that shellac will, and at this time, when shellac is so costly, it not only is an advantage to use this product, as far as results are concerned, but it is a means of economizing. The same manufacturer makes a large line of other products, under the trade name of Permatex products. This is a quick selling line for dealers and anyone interested should write for prices and full particulars direct to the manufacturers.

How Dixon's Helped Chevrolet.

A hot pace was set by Louis Chevrolet when he drove his Dixon's lubricated Frontenac flyer around the 100-mile Harkness cup course at Sheepshead Bay track on Saturday, September 23rd. Before 40,000 spectators he sped over the course in 54 minutes and 20 seconds, making the distance in 2 minutes and 30 seconds less than the dare-devil Dario Resta, another Dixon disciple, had previously covered this distance. The famous French upholder of the Frontenac colors took the lead in the first five miles and except for a short interval was never headed. One of the things which helped him win the race was, naturally his immunity from trouble. Old man friction always has a front seat at the big speed tournaments and is one of the most troublesome jinxes that must be headed off by the driver who would be successful. Not only must the winner in such close competition have great skill as a driver but he must also be far-sighted enough to be prepared to discount trouble. It was far-sightedness more than fortune that helped Chevrolet win out for he had been far-sighted enough to choose Dixon's graphite automobile lubricants. His past experience and the record of scores of other noted racing drivers were recommendation enough to Chevrolet. So it should be to every professional driver, pleasure drivers, or those who use motor cars as a business aid.

Guaranteed Magneto Parts.

Too much emphasis cannot be laid upon the importance of using nothing but the highest grade parts, guaranteed goods, when making replacements to the magneto, coil, timer-distributor, starting motor or lighting generator. The proper functioning of the ignition system, starter or generator is too important to impair their efficiency by the use of cut price goods, products that are costly and expensive in the long run. The manufacture of magneto, coil, distributor, motor starter and lighting generator parts requires years of experience and as well as a thorough knowledge of each particular make of magneto, etc., of which there are a large number on the market. This knowledge and experience has been acquired through an experience extending over fifteen years on



Illustrating Some of the Magneto and Timer-Distributor Parts Carried by the Guaranteed Magneto Parts Corp.

the part of the Guaranteed Magneto Parts Corp., 1765 Broadway, New York City. This concern produces and carries in stock a most comprehensive line of parts for all standard makes of magnetos and timers and distributers of the battery system of ignition, also for starting and lighting systems. Not only is the company prepared to ship at short notice any of these parts but it maintains one of the best equipped repair shops in the country and which is devoted to the expert repairing of all makes of magnetos, generators and motor starters. The facilities of the company are such that work is returned the same day the job is received, a service that appeals to both owners and garages. The Guaranteed Magneto Parts Corp. issues a very comprehensive catalogue describing and illustrating magneto, coil, generator, starter parts, etc., and it will be sent free upon request. This book should prove a valuable addition to every garage and repair-shop. As each part illustrated is numbered, it is a simple matter to order correctly any desired part.

The Trojan Roller Bearing.

The Ahlberg Bearing Co., 2636 Michigan Ave., Chicago, Illinois, and its branches are distributing the Trojan roller bearing for Ford and Chevrolet 490 front wheels. This bearing is a high grade tapered roller bearing made to take the place of the regular cup and cone bearings which are furnished with the Ford and Chevrolet cars. No changes whatever are needed in the present hub and spindle. It is only necessary to knock out the old bearings and insert the Trojan bearings in their

The Trojan Roller Bearing.
For Ford and Chevrolet Front Wheels.

place. Several thousand bearings have been in service for a considerable length of time and they have proved entirely satisfactory to the users.

The Halladay Line.

The Halladay Line, made by L. P. Halladay Co., Chicago, Illinois, for the coming year will include a number of new bumpers especially designed to meet the requirements of new car models, the construction of which necessitates a bumper of special design. It is the policy of the Halladay Co. to keep their line of bumpers so complete that there is a bumper for every car on the road no matter how new or old. Among the new patterns for front and rear are several with hinge adjustments and a new spring bar of entirely new design. The Halladay Flexlevers, both Ford and heavy car types, retain their popularity and will be continued without change in detail. Other items in the line include the Halladay can tipper, tilting steering wheel, side and rear tire holders and several items of minor importance. The Halladay Company is getting ready to produce several new accessories which will be announced in the near future.

S. O. S. Storage Batteries.

The following letter from Barney Oldfield, the celebrated racing driver, will interest many of our readers:

"The Crown Hotel,
Providence, R. I., July 23rd, 1917.

Victor Storage Battery Co.,
Moline, Ill.

Gentlemen:

The battery which you put in my 6-cylinder Packard about two years ago I used for 48,000 miles, and never had it overhauled. My only regret is that when I sold my old car I neglected to keep the battery for my new Twin Six Packard.

You know me,
BARNEY OLDFIELD."

There could hardly be a stronger testimonial than the above. It would be a remarkable thing for a battery to give two years service in driving 48,000 miles, even at normal speeds, but to give such service on a car driven by Barney Oldfield is of course even more wonderful. The S. O. S. battery is adapted for all extremes of heat or cold, and the manufacturers state that the wonderful service and long life given by these batteries is only made possible because the plates will not buckle or sulphate. The S. O. S. battery plates are now supplied as replacements for the plates in other popular batteries. Dealers should write for price list of these plates and any who are interested, should write for their pocket battery guide to the manufacturers of S. O. S. batteries, The Victor Storage Battery Co., 701 Fourth Avenue, Moline, Illinois.

Incorporation of Essex Motors.

Announcement has just been made of the incorporation of Essex Motors, with an initial capitalization of $500,000, all paid in; and with the following officers, W. J. McAneeny, President; R. B. Jackson, Vice-President; A. Barit, Treasurer; J. L. Vette, Secretary. The Board of Directors includes, in addition to the above officers, R. D. Chapin, F. O. Bezner and O. H. McCormack. The announcement is of particular interest to the automobile trade and to the public generally because of the fact that all of the officers and directors are at present associated with the Hudson Motor Car Company. When interviewed on the subject, an official of the Hudson Motor Car Co. made the following statement:

"The organization of Essex Motors will not result in any change in the present very definite policies of the Hudson Company, but will provide for the development of a car for which we anticipate a strong demand in a price field not competitive with Hudson. It was for the purpose of producing such a car that certain of our stockholders formed the Essex Motors. There is no connection whatever between Essex Motors and the Hudson Motor Car Co. aside from the fact that these stockholders and directors are interested in the Essex Motors as individuals. Essex Motors is a separate and distinct organization and will be operated as such."

Naturally there is much speculation and there are many inquiries regarding the design of the Essex car, but officials of the Essex Motors decline any detailed statement in that direction for the present.

Kellogg Pump for Every Car.

The Kellogg Manufacturing Co., Rochester, New York, announces the enlargement of their production to such an extent that they are now able to supply any and all makes of automobiles with the Kellogg engine driven tire pump. This pump is being adopted by many manufacturers as standard equipment which is in itself a great compliment to the merit of the product.

The "X" Radiator Liquid.

This is a scientific preparation for mending leaky automobile radiators without metal or fire. It is claimed that this compound will absolutely make new radiators leakproof, rustproof and scaleproof. It contains no cement, powder or meal and cannot clog the radiator. It will not injure metal or rubber. This compound will not evaporate, freeze or lose its qualities with age. The big "X" on the can is a special trade mark which identifies this compound. Readers who are interested should write for prices and particulars to the "X" Laboratories, 630 Washington St., Boston, Massachusetts.

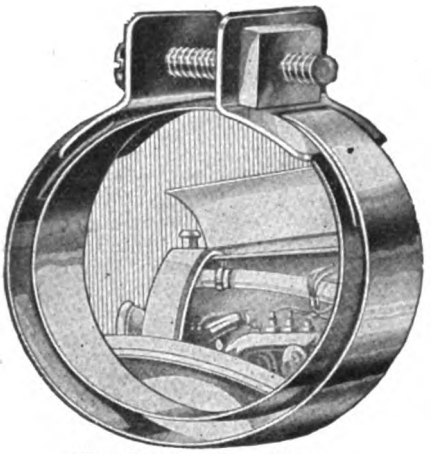
"Business Is Not as Usual."

"I should say that business is not at all as usual," said W. O. Duntley, president of the $14,000,000 Chicago Pneumatic Tool Company, which make the Little Giant line of trucks.

"Indeed, the motor truck business is better than it has been in some time. Our current sales have topped all previous selling peaks.

"The campaign for economy now being so forcefully carried on by many agencies, and in particular the newspapers, has brought home in striking fashion the assured economy of motor transportation.

"Business executives are recognizing it as part of their duty to retire their horses, which eat up uncountable acres



Digitized by Google

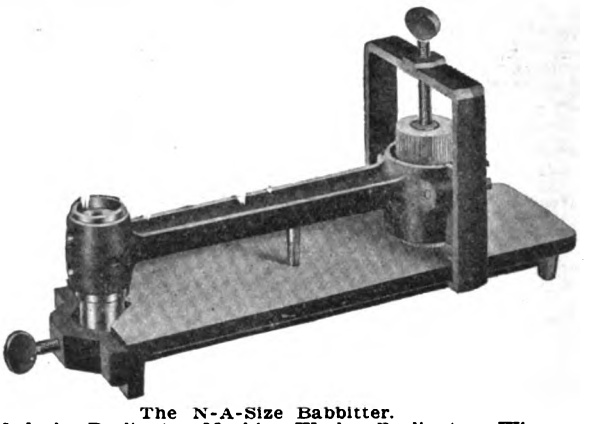
of food that should feed human beings. In addition to this need and endeavor for national economy, personal economy also dictates that as the price of food is constantly rising, the work horse must be retired because he is too costly a transportation unit.

"And everywhere, and in greater numbers than ever before, the efficient, economical motor truck is displacing the traditional weary-eyed, ever-eating horse."

The Cooper Patented Adjustable Hose Clamp.

This is a new hose clamp which is mechanically correct in every detail. The inside surface of the strip is perfectly smooth. There are no laps or seams, no roughness in the stripping to cut, bruise, friction, or otherwise damage the hose. No feature of the clamp has been sacrificed in making it adjustable. This clamp circles the hose twice, giving it unusual strength of grip. It is locked firmly at all times and the nut cannot be loosened from the bolt nor the strips from the head without the use of a screw

The Cooper Hose Clamp.



driver. It is simple in construction, making it easy to remove or replace. For dealers, 100 Cooper patented adjustable hose clamps are packed, unassembled, in a neat, substantial telescope box. Each box bears a label giving the few necessary directions for assembling and adjusting to any size hose. Full particulars will be gladly furnished by the manufacturer, Otis-Flagg Corp., 53 Hope Street, Brooklyn, New York, to whom all inquiries may be addresed.

Wagner Auto Engine Cleaner.

This is a very handy device for cleaning the motor of any automobile. One quart of kerosene and six pounds of air pressure with the use of this device, will remove all dirt, grit and grease from your engine. This engine cleaner will prevent wear and pays for itself many times over by eliminating repair bills. It is easily used, is economical and thorough. It is a valuable addition to the equipment of any repair shop. Write for price and particulars to the Wagner Specialty Co., 1902 Broadway, New York City.

The N-A-Size Babbitter.

We illustrate an excellent device for babbiting any size of automobile engine connecting rods, which is an exceedingly useful tool for any repair shop or garage. With this device, the automobile owner can have his rod bearings made at once, and will not have to have his car laid up for days or weeks waiting for new bearings from the factory. The repair shop can also use this machine for making extra bearings, and a bearing cast solid in the rod will give better service, thus holding satisfied customers and getting new business and more money for the repair men. The cost of this machine is $7.50 and the price of the machine will be paid back to the operator on the first set of four connecting rods finished. Such a needed device certainly should be in every up-to-date repair shop. This machine is manufactured by the Burlington Machine Works, Burlington, Iowa, to whom all inquries should be addressed.

The N-A-Size Babbitter.
Made by Burlington Machine Works, Burlington, Wis.

Change of Name.

This is to advise that the American Brass Foundry Co., of Milwaukee, Wisconsin, has changed the firm name and will hereafter be known as the American Metal Parts Co. There will be no change in the policies of the firm and there has been no change in the personnel of the firm except that S. A. Fulton, president of the Fulton Co., Milwaukee, Wisconsin, has purchased an interest in the business and is now an officer and director of the company. The entire sales of American bumpers and other products will be handled exclusively by the Fulton Company, and all sales correspondence, inquiries and orders should be directed to the Fulton Co., 726 National Avenue, Milwaukee, Wisconsin. All remittances and correspondence relative to accounts should be directed to the American Metal Parts Co., 1916 St. Paul Ave., Milwaukee, Wisconsin.

Raybestos Brake Lining.

The Raybestos Co., Bridgeport, Connecticut, manufacturers of the Raybestos brake lining, in marketing their product, always arrange to co-operate with dealers warmly by providing suitable equipment for the sale of their product. We illustrate herewith the equipment which is provided for dealers to contain the Raybestos brake lining. The company has also arranged recently to put up Raybestos brake lining for Ford cars in special boxes for the trade. Each box contains three pieces of brake lining and the necessary rivets for attaching to the brake band. Raybestos product is of standard quality and so well known to our readers that further description is hardly necessary. Dealers who are interested should communicate directly with the manufacturer at Bridgeport, Connecticut.

Handy Rack for Raybestos Brake Lining.

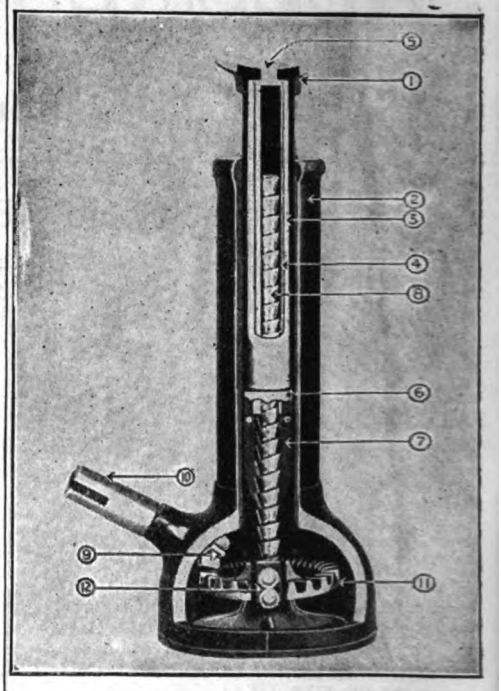
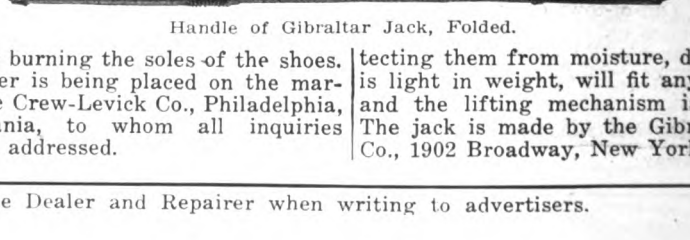
Victor Heater for Ford Cars.

We illustrate herewith a new heater especially designed for Ford cars. Many owners of the Ford who live in cold climates, are compelled to discontinue motoring for several months in the extreme cold weather, but the Victor heater is intended to obviate this difficulty. The manufacturers state that this heater really heats the car within a half a minute after starting the engine, and gives a plentiful supply of warm, fresh air. This heater is built exactly on the same principles as the hot air furnace, circulating fresh air over a heated drum and sending it upward. The drum of the Victor heater runs lengthwise, at right angles to the exhaust pipe. The exhaust coming direct from the engine, is turned into the drum. The fresh air circulating around the outside of this drum, is heated by the hot gases inside, and rises into the car. As you sit in the car all that can be seen of the Victor heater is a handsome black-enamelled grill, flush with the floor. No metal or heated parts are inside of the car, and there is no danger of scorching the clothes or burning the soles of the shoes. This heater is being placed on the market by the Crew-Levick Co., Philadelphia, Pennsylvania, to whom all inquiries should be addressed.



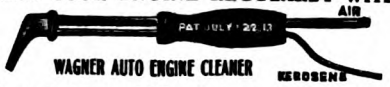
Victor Heater for Ford Cars.



The Gibraltar Automobile Jack.

We illustrate this new jack and the cut clearly shows its interior construction. A spiral screw engaging with dogs on the lifting bar is turned by a gear and pinion. This mechanism rests on end-thrust ball-sockets, which carry the entire weight of the car and reduce friction to a minimum. This jack is operated by a long folding handle; and by this means the jack may be placed in any position under the car and operated and removed without soiling the hands or clothes. The folded handle is shown herewith.

The jack is said to be remarkably fast, and all working parts are enclosed, protecting them from moisture, dirt, etc. It is light in weight, will fit any tool box, and the lifting mechanism is of steel. The jack is made by the Gibraltar Jack Co., 1902 Broadway, New York City.



The Gibraltar Jack.

Handle of Gibraltar Jack, Folded.

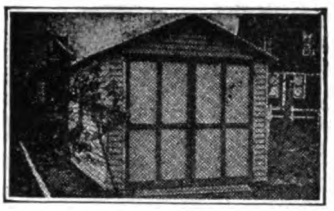
ATLAS AUTO SUPPLY CO., 616 W. Austin Ave., Chicago, Ill.

Pathfinder Company Organized.

The Pathfinder Company of America has been organized to succeed the Pathfinder Company, Indianapolis, Indiana, with a capital stock of $2,000,000.

The new company will continue the manufacture of Pathfinder pleasure cars without change, in larger volume than before, and will also enter the commercial truck field.



The officers and directors of the new company are: President, Charles McCutcheon, Indianapolis; vice-president, Fred C. Dorn, Cleveland; secretary and treasurer, Paul N. White, Indianapolis; directors, the officers and C. J. Root, Terre Haute, chairman; A. C. Brown, St. Louis, president of the Hamilton-Brown Show Company; William A. Umprey, Indianapolis, vice-president Weidley Motors Company; Paul N. White, Indianapolis; Charles McCutcheon, formerly president of the Jackson Gear Company, Jackson, Michigan, and George L. Mosher, capitalist, Los Angeles.

The officers of the former company were William C. Teasdale, Jr., president; W. E. Stalnaker, vice-president; Wayne K. Bromley, secretary-treasurer. Karl Felicke, the chief engineer, remains.

The enlarged plant for the manufacturing of pleasure cars and commercial trucks will be at the present site, 1136 Division street, Indianapolis, Ind.

The Dearborn Truck Unit.

The Dearborn Truck Co., 1250-64 S. Campbell Ave., Chicago, Ill., are placing on the market a Dearborn Truck Unit of one and two-ton capacity, for Ford cars. This unit is practically the rear half construction of a standard truck, though it is built with a full length frame, and when attached to a Ford chassis converts it into a one or two-ton truck. The Ford-Dearborn gives the purchaser an economical, quick delivery truck with the great strength united with the efficiency, simplicity and economy of the regular Ford power plant. This is a quick selling specialty for dealers and readers who are interested should write direct to the manufacturers as we understand that there is considerable open territory on this specialty.

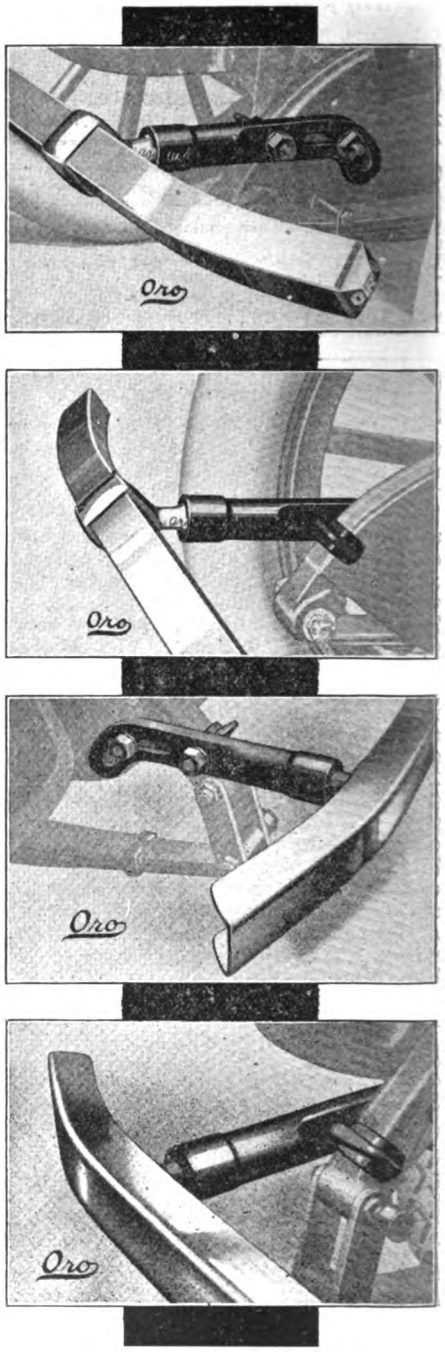
IT FITS 90% OF THE CARS

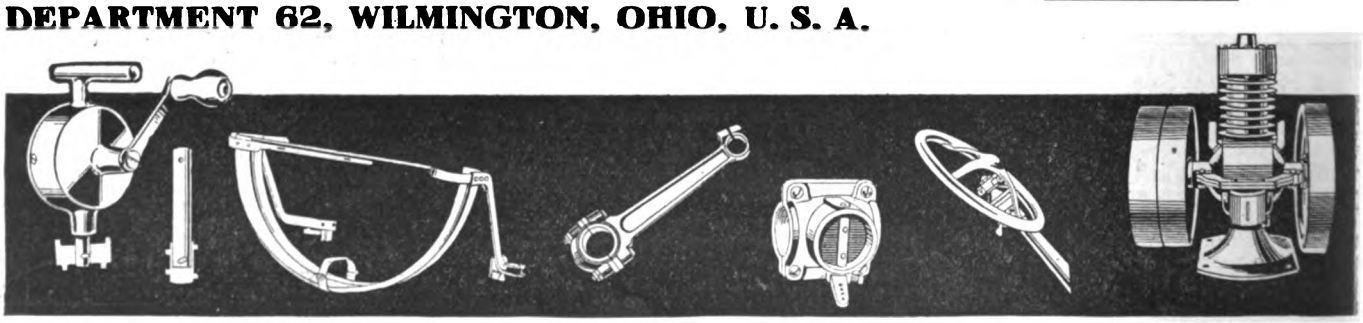
It is no longer necessary to carry ten or twenty styles of bumpers in stock in order to fit the majority of cars.

This new Universal Bumper can be clapped right onto 90% of the cars as fast as they drive into your place. By specializing on the



Oro
GOOD as GOLD

you tie up less money in stock, use less display space, spend less time in closing sales, and make more profit.



The illustrations show how the same clamps can be adjusted to fit different types of cars. Width between chassis members, presence or absence of mud aprons, location and style of fenders are immaterial as far as this bumper is concerned. No holes to drill, no bolts to remove—a wrench is the only tool required.

You will find the same tough material and good workmanship in this new bumper that you have found in the other accessories of the high grade "Oro" line.

Write for the "Oro" catalog and order the new Universal Bumper from your jobber today.

THE LOGICAL STEP

How AMBU Attaches to Battery

in making your repair department more prolific and more efficient in Electrical Starting and Lighting repairs is the adoption of—

AMBU
TRADE MARK

Ambu Electric Trouble Shooter is an instrument which automatically detects and locates accurately and quickly trouble in any American made starting and lighting system used as standard on any American made cars—and shows you what the trouble is and exactly how to repair it—

Autolite, Remy, Bijur
Rushmore, Delco, Westinghouse
Dyneto, Entz, Gray & Davis,
Splitdorf, Apico, North East,
U. S. L., Wagner, Ward Leonard,
Adlake, Deaco, Disco,
Allis-Chalmers, Bosch, Jesco,
Esterline, National
Leece-Neville, Simms-Huff

AMBU SERVICE

Ambu service consists of Ambu wiring diagrams—showing the exact layout of every electrical system as applied to automobiles; covering 400 or more cars.

Ambu Repair Charts—giving concise and practical working information and complete instructions on how to make repairs quickly and positively.

Ambu Service Bulletins keep you posted on all changes, additions and improvements which may be made in the various systems.

Ambu Engineering Advice—to help you out of any unusual difficulties.

The complete Ambu Service contains information impossible for you to obtain in any other way—viz., showing internal hidden wiring connections rarely shown by the makers themselves—classified, systematized, readily accessible, and filed in a handsome, substantial metal case with lock—a compact authoritative service.

Ambu Endorsed by Big Men in Automobile Business

Big men seriously endorse Ambu because they quickly see its wonderful value—

We have scores of enthusiastic letters from owners and users of Ambu,

the seal of approval from men who know and who are making their shops more prolific—more efficient and reaping a nice income—

We will gladly supply their names and facsimile copies of their letters if you desire that evidence.

And remember—our interest does not stop with your purchase, it centers in you as long as you are in business and are using Ambu—we show you the way to more and better business—

It's the step from a perhaps limited Electrical knowledge from guess work, from searching all over the car in a half blind way to the possession of an accurate complete knowledge and definite assurance of a quick successful repair job every time you tackle one—

And a good price for the work, too—because you and the car owner know it's right.

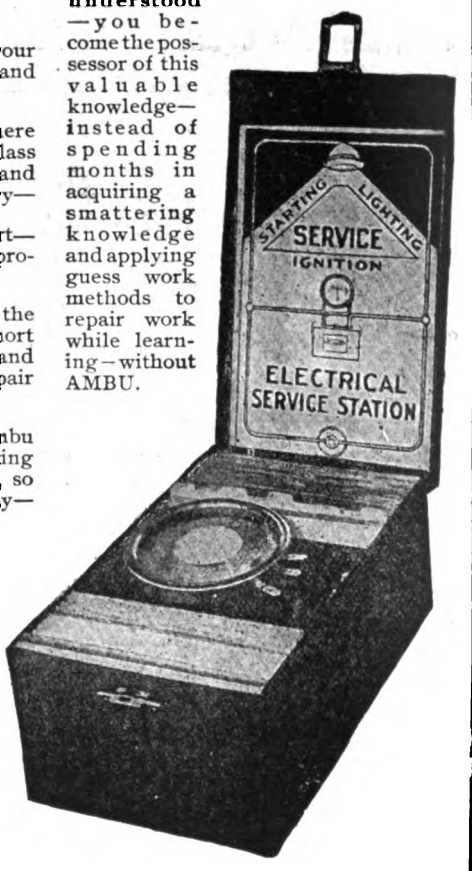
Ambu enables you to make your Electrical repairs more prolific and more efficient.

Ambu puts you—no matter where you are located—in the same class with the best informed starting and lighting repair men in the country—

With Ambu you become expert—quick, an authority—a prolific producer—

Because — you know where the trouble is—after making 3 short tests with Ambu—what it is—and you quickly and efficiently repair it—

It takes less time—if you use Ambu to make authoritative and lasting repairs than by the old methods, so you can do more jobs each day—better work—quicker work—more work — satisfied car owners.



That's the result of the possession and regular use of Ambu—

If you knew all about all the many makes of starting and lighing systems—if you knew the wiring and adaptations on every make of car you would not need Ambu—

But it's humanly impossible for you to know all this—there are too many and you have not the time or opportunity to master this overhelming detail.

So you do need **AMBU**

Because Ambu knows and by the simple operation of buying the instrument — wiring diagrams — charts and instruction book — simple, specific and easily understood —you become the possessor of this valuable knowledge—instead of spending months in acquiring a smattering knowledge and applying guess work methods to repair work while learning—without AMBU.

Kimball Button-Grip Tire Kimball Vacuum Bar-Grip Tire

I See you're Anchored RIGHT

"YES—I'M BACKED BY KIMBALL TIRES"

Any "Kimball" dealer—anywhere—will tell you that the prices he is able to buy "Kimball" Tires and Tubes for are the foundation of his success. Of all the things that go to make a tire shop profitable and prosperous, nothing is so important as having an attractive and durable tire at attractively low prices.

You keep the confidence of your customers by becoming an authority on Tires as soon as you touch the Kimball product, for their popularity is sweeping the country.

Kimball's idea of a good Tire is the best yet—and the dealer who looks at an idea to see if he can use it, and not to see if he can get along without it—is the man who will soon be looking for larger quarters to accommodate his growing business. Write quickly—for your territory.

IF YOU GET STARTED RIGHT—

You Can "Put It Over"

No doubt your product has merit—we believe it. We share your opinion that you have a sure winner.

Even if this is so, and your friends are slapping you on the back, this does not indicate for one single minute that you have entered your product in the race.

There are hundreds of good inventions—splendid products in this great land, which today are smothered—actually smothered under tons and tons of indecision—vacillation, weak-kneed intention, blue-mold of apathy—call it anything you like—it's the direct opposite to what progress demands from the successful manufacturer or true merchant of today.

If at the present time the world at large knows little or nothing about your product, you are at that crucial point where you've either got to "put your good thing over" by the use of good advertising copy in a good medium or let it die of dry rot.

Our "put it over" department will train and whip your copy into splendid shape for the race. Your product, of course, has the quality—our copy department will develop its staying power.

Tell us what you know about your product and we will introduce it to the "medicine ball," which will build up the many good points that may have been overlooked, until the copy for advertising your product is ready for the shower-bath of criticism given by the copy masseurs and rubbers of this department. Then your copy, in the pink of condition, steps forth to conquer.

SELECTING THE RIGHT TRACK FOR THE RACE— THE MOST IMPORTANT POINT OF ALL

As you step out on the field and into the track, you can hear the thunderous applause of the great and enthusiastic audience—all members of the "start right club"—subscribers and readers of

The Automobile Dealer and Repairer

32,000 STRONG

A Carefully Selected List of People Who Are Going to Appreciate Your Endeavor and Help You Win the Race

It is not a question of having big capital—it's a matter of spending what capital you have with the right medium—and the right medium is always the one which shows tangible results—not merely vague, general publicity.

In our "put it over" department we create advertising ideas, draw pictures, border designs and lay-outs which attract the reader's attention—holding, at the same time, the proper commercial value.

We write advertising that will boost your product—bring it from obscurity and through our medium, put it into the markets of the world. We call it result-producing copy, but do not forget this important point—the best piece of copy ever written will not produce good results unless it is placed in a good medium.

YOU CAN "PUT IT OVER" IF YOU GET STARTED RIGHT

For *sure, tangible, satisfactory returns,* place your advertising in

A MASTER'S TRIBUTE TO

TRADE MARK **S.O.S** REGISTERED

STORAGE BATTERIES

THE CROWN HOTEL,
Providence, R. I., July 23rd, 1917.

VICTOR STORAGE BATTERY CO.,
MOLINE, ILL.

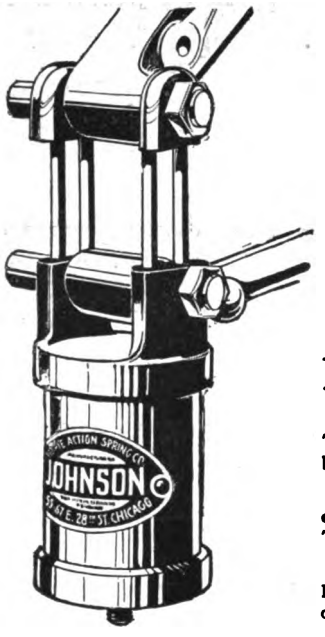
GENTLEMEN:—The battery which you put in my 6 cylinder Packard about **two years** ago I used for **48,000 miles,** and never had it overhauled. My only regret is that when I sold my old car I neglected to keep the battery for my new Twin Six Packard.

You know me,
BARNEY OLDFIELD.

A battery that will give two years' service in driving 48,000 miles at normal speeds is unusual. But a battery that will give two years' service and 48,000 miles as Barney Oldfield drives is wonderful.

Yet this is no unusual service for S. O. S. batteries. In the remote places of the world where the service station is unknown, where a battery stands or falls on its merits as a battery, S. O. S. batteries are giving the same wonderful service. In far South Africa, on the other side of the Equator, where Hupmobiles are preferred in Government service, S. O. S. batteries are preferred for Hupmobiles. In the plains of Nevada, subjected to extremes of heat and cold, S. O. S. batteries are preferred for railway signal work. And in thousands of farm homes they have proven themselves the most dependable and fool proof storage batteries yet produced.

The wonderful service and long life that S. O. S. Batteries give is only possible because the plates will not buckle or sulphate, and this is guaranteed.



S. O. S. Storage Batteries **cost no more** than **ordinary batteries.** Yet their worth would justify a higher price. They are made for all makes and models of cars, for Farm Light Plants, and other isolated installations. Our **Pocket Battery Guide** shows the proper battery for all cars. A postal brings it.

S. O. S. battery plates are now supplied as replacements for the popular makes of batteries. **Dealers:** write for price list of these plates.

Temme

SPRINGS FOR ALL CARS

DO all the lame cars drive to *your* door for Temme Springs and other things?

In most good towns, Temme Springs and Temme's Triple Action Service are known to be *as good as gold.*

Hundreds of repairers, who have "banked" on Temme and never lost, are putting up Temme highway signs today.

These signs *will* bring in business. Temme has tried them, so he *knows.* And now he offers *you* what won for him.

Temme Springs *"for all cars"* means just what it says—for all cars *since 1902.* Test us by naming the spring you need. Temme Triple Action Service will have it on the way to you the same day.

"For all cars" means *designed* for all cars to factory specifications. And so good are Temme Springs—so prompt the service—so fair the prices—that dealers in *all* cars now buy from Temme *in preference* to the car maker.

You need these springs, this service, these signs. They will make you money, bring new business, help you build the good reputation you are after.

If you delay you may lose this exclusive proposition. Write or wire us now, saying: "Send Temme Spring Service Station proposition at once."

JOHNSON
Shock Absorber

This is to remind you of the new model of the famous Johnson Shock Absorber—made by us. The only cure for a hard riding car is a pair of Johnsons. Temme Spring Service Stations make good money on them. Write now for our new proposition.

TRIPLE ACTION SPRING CO., 79 East 28th Street, CHICAGO

900 Pages instead of 824 **1918—SIXTH EDITION** 3362 Illustrations instead of 2000

STILL $3.32 prepaid **Dyke's Auto Encyclopedia.** STILL $3.32 prepaid

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 **Instructions**—Simplified and practical.

3362 **Illustrations**—the kind you understand at a glance.

2 **Supplements**, parts printed in colors, treating on the construction operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc.

775 illustrations and 279 pages on **Electric Ignition, Electric Starters** and **Generators**, etc.

51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on **Repairing.** Oxy-Acetylene Welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 180 illustrations on **Tires** and **Tire Repairing.**

44 pages and 119 illustrations on **Carburetion.**

89 pages and 291 illustrations on **Engine** and **Parts.**

16 pages on **Digest of Troubles.**

6000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index** begins on **colored** paper, easy to refer to.

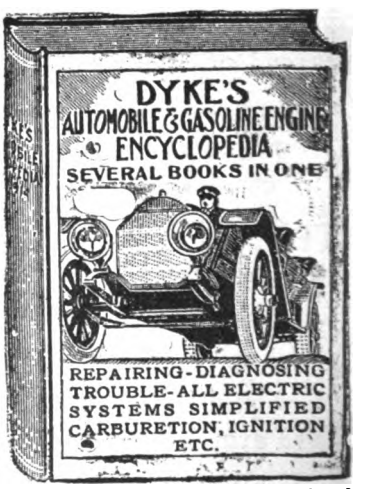
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

You must see this SIXTH Edition in order to appreciate just how complete a book it really is—Order N-O-W.

Price—Although a much larger and better book the price for the present remains **$3.00** (or **$3.28** prepaid, express).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

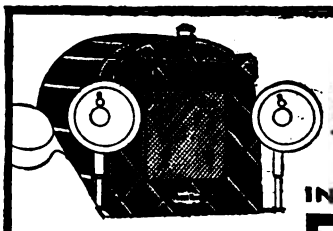
Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.



All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

An Easy Riding Feature
That Will Make

GORDON Seat Covers
TAILORED TO FIT

More Popular Than Ever

The new three-piece or "Sectional Overlap Lazy-back" construction of "Gordon" Seat Covers adds ***complete riding comfort*** to the other desirable features of Seat Covers. The Overlap gives entirely free movement to the upholstery; you can sink back into its depths and enjoy solid comfort. This new "Gordon" Cover is easier to put on; the overlap takes care of any variance in the upholstery and relieves all strain on fabric and fastenings—in short it is better for the dealer to sell and is immeasurably more practical for the car owner.

Investigate this new style Cover—it means real money to every accessory dealer.

GORDON
Radiator and Engine ROBES

Every experienced motorist has a hearty welcome for the "Gordon" Robe—it insures full service from his Car all Winter. It is made in two parts—a robe for the hood and curtain for the radiator. Hood raises as easily with a "Gordon" Robe on as with it off.

Made in sizes to fit every automobile, and in two styles for Ford Cars—one-piece curtain and divided curtain.

Every automobile should have one. Get your share of the business by being prepared for it—don't let your customers wait until Jack Frost puts their Cars out of use—order a stock of "Gordons" to care for your trade before the cold days come.

Send for the new "Gordon" Catalogue for 1917-18.

FOX TYPEWRITERS

Factory Rebuilt Like New at $65.

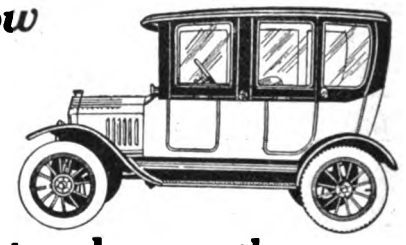
The word "rebuilt" has been abused and misused until it has become a meaningless trade term. When we rebuild a Fox Typewriter we take it all to pieces, re-nickel the nickel parts, re-enamel the frame and replace all worn parts with new ones. The same men who originally built the typewriter do this rebuilding **and do the work just as good.**

50% NEW PARTS AND 3 YEARS GUARANTEE

We offer a rebuilt Fox Typewriter, Model No. 24—*just like new*—for $65.00. These have standard carriages taking paper 10½ inches wide, any kind of keyboard, any kind of type, rubber covers, tabulators, back spacers, two-color ribbons, and are complete with instruction books and cleaning outfits.

Send us any amount you can spare, **from $1.00 up,** as a first payment, and pay the balance $5.00 monthly. Or, send $61.75 all cash. If $10.00 or more is sent with order we will include Free our $4.50 Solid Oak Typewriter Table. Transportation must be paid by the purchaser.

Please order direct from this offer, mentioning Automobile Dealer and Repairer for January. State price you wish to pay and enclose any amount of cash you can spare.



Pay $5.00 Monthly

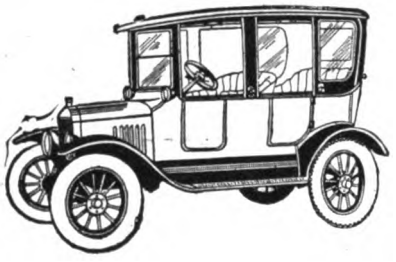
DETROIT DETACHABLE WEATHERPROOF TOP



Absolutely Storm Tight from Windshield to Rear Window

ELIMINATES instantly all the Ford drivers' former hardships—no bothersome side curtains to adjust in the biting cold or blinding snowstorm. No change made in the standard body. Entire top can be attached by anyone in three hours.

It is the only patented all-weather top that does away with the objectionable features of a detachable top and affords the car owner an enclosed or open body for year-round use at a really low price.

It is absolutely rattle proof and will last as long as the car.

Just One of the Exclusive Features

of this convertible type top is the patented flexible, easy sliding doors, which disappear into the roof and increase entrance area. Not only is the full door-space available, but Detroit Weatherproof doors are three inches wider than the doors of the Ford; this gives ample entrance for the occupants even though the arms may be filled with bundles. For the other 9 big improvements, see our literature—write us to-day.

SHARRER PATENT TOP CO.

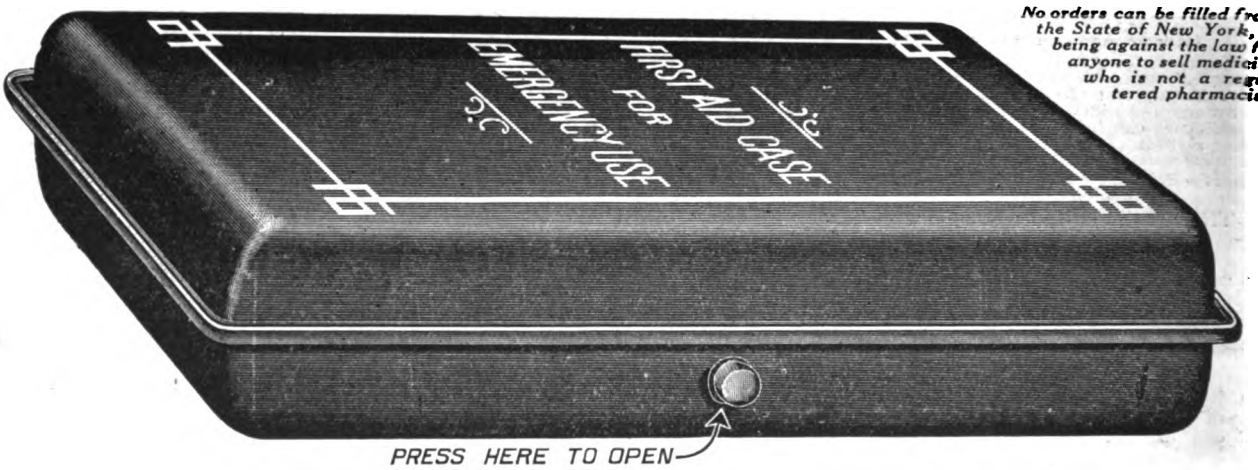
A fine Fall and Winter Proposition for Dealers



ALSO FOR CHANDLER LIGHT SIX, HUDSON SUPER SIX, CHALMERS 5 PASSENGER, BUICK D45

IT MAY BE YOUR TURN NEXT

TO MEET WITH AN ACCIDENT ON THE ROAD.

It may also be a case of life and death to have the materials at hand for prompt treatment. We have recently made arrangements for a First Aid Case for emergencies especially for the readers of the AUTOMOBILE DEALER AND REPAIRER.

No orders can be filled from the State of New York, it being against the law for anyone to sell medicine who is not a registered pharmacist.

This case is made of heavy Bessemer Steel, size 11½x5½ and 2¼ inches deep, finished in Black Baked Japan and fitted with a strong instantaneous snap. It is strong enough to resist injury to the contents through accident or dampness.

The contents have been carefully selected to supply the needs in an emergency, before the doctor comes. All gauze, bandages and cotton have been prepared in aseptic laboratories under the same rigid inspection as those supplied to the United States Army and Navy.

The contents of this case consists of:—1 "First Aid to the Injured" Instructions. 1 Yard plain Sterilized Gauze for dressing large wounds. 10 Yards 2-inch Sterilized Gauze Bandages for dressing cuts and bruises. 10 Yards 2½-inch Sterilized Guaze Bandages for dressing cuts and bruises. 1 Package Sterilized Absorbent Cotton for pads and dressings. 1 Box Carbolic Salve for burns, sores, insect bites, etc. 1 Yard 1 inch Zinc Oxide Adhesive Plaster for retaining dressings and covering small wounds. ½ Ounce Tincture of Iodine, an antiseptic for immediate use on all wounds and abrasions. ¼ Ounce Spirits of Ammonia for use in case of shock, heart failure and faintness. ½ Dozen Safety Pins.

The retail price of this outfit is $2.50. We have made an arrangement with the manufacturers of such a liberal character that we can supply this outfit with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year, for the low rate of $2.50.

In case you have already subscribed for this year, we will send you one of these outfits, postage prepaid, on receipt of $1.50, which may be remitted by check, money order, or in any convenient way.

Every subscriber to the AUTOMOBILE DEALER AND REPAIRER should have one of these outfits. It may mean the saving of your own life or the life of some friend. ***ORDER AT ONCE AND THEN YOU WON'T FORGET ABOUT IT.***

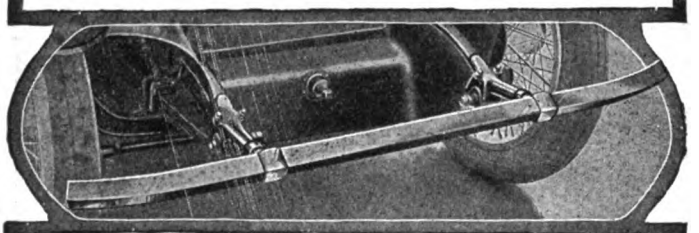
Crane TRADE MARK ENGINE-DRIVEN TIRE-PUMP

Does what *no* other pump *can* do. Because BUILT as *no* other pump *can* be built. Piston works *through* a Packing-Ring, reducing wear to the *minimum*. Beveled base of Ring shaves surplus oil off piston at every stroke. Permits ample lubrication, but prevents oil passing Ring.
Ring is endless. No gaps for air to leak out or oil to leak in. Can be instantly adjusted (by turning cylinder) to maintain air-tight, oil-proof fit, and insures 97% efficiency. This high efficiency enables the CRANE to do the work of pumps twice its size, weight and parts.
And small size, light weight, few parts and simplicity mean low production-cost. That's why the CRANE sells for $10 complete despite high grade materials and finest workmanship.



The full story of the CRANE and its patented Packing-Ring is told in an interesting little Folder—just off the press. Write for FREE copy to-day.

Drilling Sheared-off Bolts

In Ford cylinder blocks is usually a ticklish and mean job. But it's a cinch—no removing of cylinder head—with

Simple as it is Effective

STEVENS NEW YORK

Tap and Drill Set

For it eliminates guessing at the center of the bolt—and a **special bushing** does the trick! This bushing fits snugly into the hole and unerringly guides the drill through the exact center of the bolt. The tap is thus enabled to dislodge deftly every particle of the broken bolt thread, leaving the hole absolutely clear for a new bolt of the original size.

This special bushing feature is included in every set. Put up in neat wooden box.

List Price, $1.00

Taps and drills are of high grade steel and guaranteed against any defects and breakage.

BAILEY BALL THRUST

Replaces Thrust Washers at Left (Gear) side of

FORD AND CHEVROLET 490 DIFFERENTIAL

Practically every time a Ford or Chevrolet 490 owner comes to you because of rear axle trouble the difficulty rests in the fact that his old flat thrust washers at the left (gear) side of the differential *have worn thin*, causing gears to get out of mesh and break. Because flat thrust washers have but a sliding contact they cannot help but wear thin and eventually cause trouble. If you insist upon installing them you create a dissatisfied customer. But the

BAILEY BALL THRUST BEARING

is made of the best materials, carefully heat treated and ground, has eighteen ¼-inch highest grade balls, a capacity for six times the maximum thrust, is an exact replacement, and made to fit to the thousandth part of an inch. Will positively keep gears in proper mesh, make them run smoothly and last indefinitely. They promote prestige for the repairmen who install them because of their positive efficiency, and the added profit is no small item.

DEALERS REPAIRMEN GARAGEMEN

The wise man will see to it that his stock contains this bearing. Immediate service to the car-owner means much to you. Do not wait until a rear axle job comes in before you order. Order today from your jobber or write us direct.

LIST PRICE, $3.75. LIBERAL DEALER DISCOUNT.

GEO. D. BAILEY CO., 1118 So. Michigan Ave., Chicago, Ill.

BLACKSMITHS all over this great land are now Repairing Automobiles and Selling Auto Goods of every description. THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.

A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

This cut shows how sub-casing fits inside tire.

THE FIRST 2 BOOKS OF THEIR KIND IN THE WORLD

A Complete Automobile Business Education for $3.50

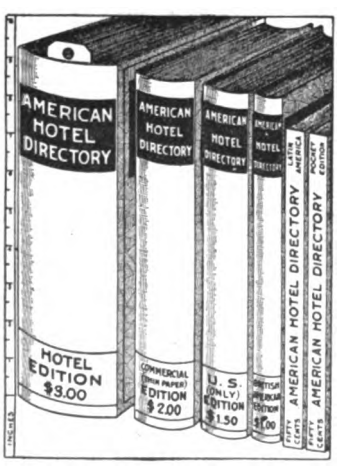
AUTOMOBILE BUSINESS

By J. H. NEWMARK

The first book in the world that discusses the automobile business from a money making standpoint. Every feature of it is thoroughly discussed from a dealer's view—opportunities that the industry presents today; best auto selling territories; organization; sales; advertising; promotion work; garage; service; accounting systems; and all other departments. 201 pages. Price $2.00 postpaid.

AUTOMOBILE SALESMANSHIP

By J. H. NEWMARK



A complete manual for the man desiring to sell automobiles; how a self propelled vehicle operates; simple definitions a salesman should know; manufacturing procedure in motor car factories—essentials of successful salesmanship; how to secure prospects; selling a car; steps necessary; what constitutes beauty, style, comfort, easy riding, convenience, power, flexibility; economy, durability, safety; how to interest prospects; demonstrations; securing order; woman in the case; trading problem; electric vehicles; trucks; etc. 121 pages. Price $1.50 postpaid.

Address all orders for the above books to

THE MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, New York.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table" on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

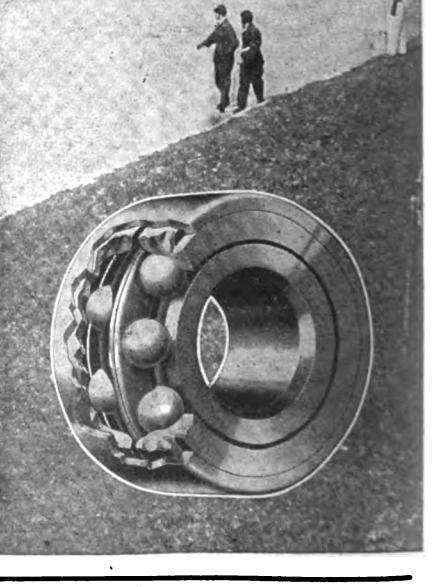
VICTORS

New Departure Ball Bearings carried Chevrolet's chassis to victory in the 100-mile race for the 1917 championship and Harkness Trophy at Sheepshead Bay on September 22d.



Likewise, Eddie Hearne's Duesenberg (third), and Mulford's Frontenac (fourth), were equipped throughout with New Departures.

It is a fitting tribute to New Departure quality that these ball bearings should aid in establishing both the 1917 champion and the new 100-mile record.

You should know why New Departures are chosen for the Big Jobs—where strength, stamina and service are first considerations. Send for the Brown Book.

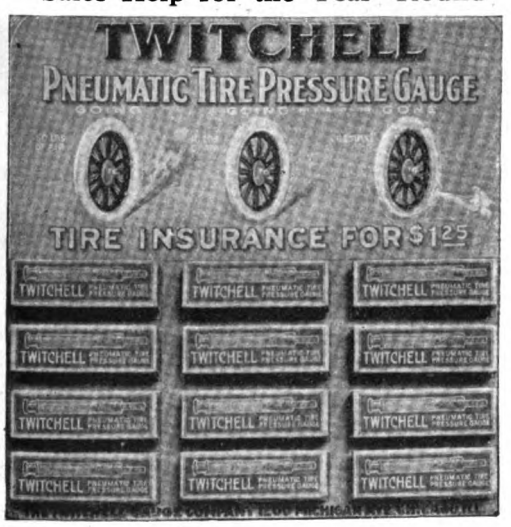
TWITCHELL



GAUGES

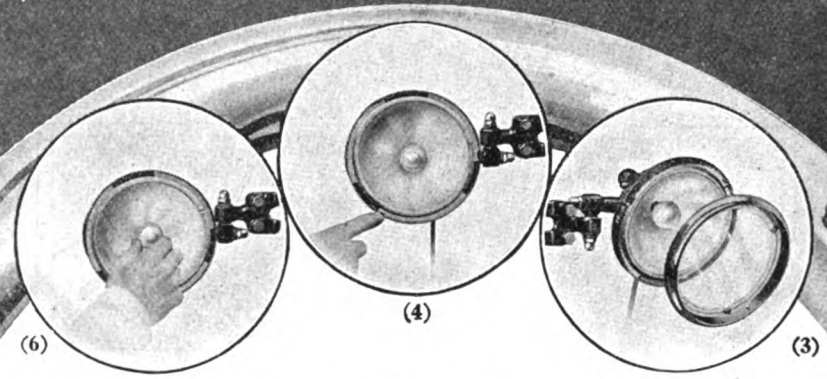
for Christmas

In order to facilitate the sale of TWITCHELL gauges as Christmas presents we are prepared to supply dealers with special holiday jackets (as illustrated), which can be slipped over the regular boxes used the year 'round. These jackets are gay with holly and very festive in appearance and add a great deal to the attractiveness of the package.

Sales Help for the Year 'Round

As a window display they cannot fail to arrest the attention. Write for your supply. They are furnished without cost.

SPECIAL NOTICE



The **TWITCHELL** gauge is now packed in dozen lots for mounting on an attractive counter display easel. Dealers having used this rack for the presentation of **TWITCHELL** gauges report their sales very materially increased thereby.

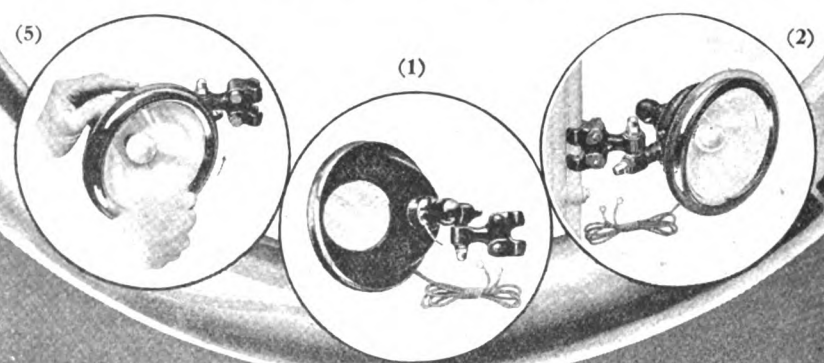
Here is the better spot lamp — Victor — $5.00



These pictures show some of the many features that make the Victor No. 50 a spot lamp of exceptional beauty, silence, and convenience.

Beauty because the 3-inch condensing mirror is inserted neatly from the inside, flush with the body (fig. 1). Every curve and line of the nickel finished door, the streamline body and the compact bracket is the expression of refined design (fig. 2).

Silence because the hingeless door is held by a tight tension latch, the glass is held firmly in the frame by clips (fig. 3). A special sealing cord between glass and reflector keeps out dust and prevents noise (fig. 4).

Convenience because the door is readily released by pressing button and turning door frame (fig. 5). The focusing device is adjustable to any sized bulb (fig. 6).

Let the Victor reduce driving dangers at once and add one more touch of refinement to your car.

RIDING THE BAND WAGON

This is a traditional trait of the American. He loves a winner. Show him one and he promptly climbs into the band wagon and goes along.

That's what garagemen and dealers in gas and oil are doing today in all parts of the country.

We have shown them a winner. They recognize it and they are riding right along to success with us.

GUARANTEE VISIBLE PUMPS

have rung the bell on all "blind" pumps. These old filling systems are going to the scrap pile. The public is responsible.

Car owners know—Uncle Sam has told—that 80 per cent of the ordinary force pumps at gasoline stations are giving short measure.

Get in now. Be the pioneer in your territory. You'll have to come to visible pumps some time. Better do it now and get the jump on competitors.

Write today for the pump book. Address Dept. 9.

The motorist who is Brunnerwise, with tires of the largest size,
Knows Brunner Service Satisfies—that's why they call him Brunnerwise.

Yes, the Brunnerwise Motorist knows that when he pulls up in front of a garage bearing the Brunner Sign that he is going to find an ample supply of compressed air at his disposal.

Garage efficiency starts at the end of the air hose and the good, healthy flow of air always available at the end of the Brunner Air Hose always inspires confidence and makes new friends for the Brunnerwise Garageman.

No. 42 Brunner Motor-Driven Air Compressor

INVESTIGATE THE BRUNNER AIR COMPRESSOR

No. 542 Brunner Assembled Motor-Driven Air Compressor

The Brunner Air Compressor has been making good in the garage ever since the garage business has been a business—it is built in a plant which has always been devoted to the exclusive manufacture of air compressors for the garageman's use. The Brunner Air Compressor is and always has been the leader of all garage air compressors in quality, service and volume of sales—and it is, therefore, worthy of your confidence.

We will be glad to assist you in the betterment of your compressed air service, which should be right up to the mark, if you expect to secure your share of the winter business - and we will be glad to give you any information you may desire regarding the use of compressed air in the garage.

There is a Brunner Jobber covering your territory who is thoroughly familiar with the Brunner Line and who would be glad to recommend it to you - let us send you his name and also one of our complete catalogs and Garageman's Handbook on Compressed Air.

Winter Driving Keeps Business Thriving

Back up the big movement for winter business. More cars than ever will be run this winter. The demand for accessories and repair work will exceed that of any previous season.

Owners are deeply interested right now in questions of power and economical operation. How to meet the Government's appeal for conservation of fuel and oil. How to overcome the difficult driving conditions imposed by winter roads and winter weather.

Realize what a direct and immediate answer you have to both questions in

McQUAY-NORRIS LEAK-PROOF PISTON RINGS

Make your customers see how they can cut down the cost of running their cars and get increased power at the same time with a set of these piston rings. Nothing to equal them for tuning-up weak, wasteful motors,—for giving such all-round dependable, efficient and durable service.

IMMEDIATE SERVICE ON ANY SIZE RING

McQuay-Norris LEAK-PROOF Piston Rings are immediately obtainable in any size or over-size—any width or diameter—for any make or model of motor. Over 300 jobbing and supply houses carry complete service stocks and can fill your order at once for all standard sizes and over-sizes. At the factory over 2000 different sizes are kept constantly in stock ready for immediate shipment.

No other piston ring manufacturer gives such complete and prompt service. It saves delay, satisfies the owner and impresses him with your live methods of doing business.

Send for this FREE book,—

"To Have and to Hold Power." It will tell you all about the Genuine McQuay-Norris LEAK-PROOF Piston Ring. Will save you and your customers a good deal of money, time and trouble. Write Dept. R.

How Far?

MANY car owners keep an eye on the gasoline tank through the medium of the speedometer. So many miles, so many gallons—time to refill.

It's a good plan to follow, too, because it keeps before your mind the mileage you are obtaining per gallon of gasoline.

This mileage depends largely, not only on the gasoline you are using, but on the condition of your motor.

The condition of your motor, in turn, depends very largely on the lubricant you use. So there is a direct relation between the gasoline tank and the crank case.

To obtain high mileage, in other words low operating cost, fill the crank case with

TEXACO MOTOR OIL

There are many reasons why Texaco Motor Oil keeps the operating cost low. Due to certain basic qualities it cannot deposit a hard carbon crust. If any carbon should be deposited due to the use of too much oil it will be in the form of a soft soot easily removed with a cloth.

Texaco Motor Oil stands up well in use, retains its original lubricating qualities, because it gives a perfect seal between piston and cylinder thus preventing leakage of gasoline into the crank case.

As a result of these facts Texaco Motor Oil enables a motor to run at its highest point of efficiency, enables the gasoline to deliver all the power there is in it, and gives high mileage.

When you buy motor oil buy Texaco. The best way, the safest way to buy, is in one or five gallon cans. You can identify Texaco by its clear, clean color.

The "Extra-Dry" Start

GETTING soaked when getting started is absurd. Ford dealers are urging their customers to come on in out of the rain. The bracing exhilaration of the electric "extra-dry" start attains its highest development in the

A-B-C
STARTING & LIGHTING SYSTEM FOR FORD CARS

TWO UNIT SIX VOLT

This final refinement of Ford performance places Ford starting in the same class with the highest priced cars.

Dealers are cashing in heavily on its superlative advantages over its entire field, and concede that it conforms more closely to Ford engineering and construction than any other electric starting system ever developed.

Thousands of Ford owners all over the world are satisfied and enthusiastic users of the A. B. C. Responds with powerful efficiency in any weather. Simple, compact, noiseless, easiest to install, and longest lived. Weight evenly distributed by units on both sides of the engine. No drag or strain on motor when starting or generating. Its fibre, leather, and metal belt, moving in V-type pulley, gives highest possible degree of pulling contact. Guaranteed efficient and mechanically correct.

If you have not yet taken it on, fill out and mail the coupon today, and learn the terms of our generous 1917-1918 dealer proposition. Once you learn the advantages of A. B. C. starting and lighting, you will always sell the A. B. C.

Harvey Service to the Rescue

A BROKEN SPRING—a frenzied customer calling for help—demanding a new spring "rush"! It's an odd size; you have none in stock to match it!

And yet you realize the importance of giving this customer real service, not particularly for the profit in this one job alone, nor even for the trade of this one customer, but because service at a time like this will bring the word-o'-mouth publicity which follows naturally when a customer is pleased.

So you call Harvey to the rescue. There's a Harvey Jobber near you, you get him on long distance, in a few words tell him your needs, and then turn to your customer with the satisfied feeling of work well done, because you know already the exact spring you want and the best spring money can buy is speeding to you.

"That's service"! says the customer. And when his car is on the road again he tells his friends about it and they say with him, "That's service"!

That *is* Service, Harvey Service, and it's always ready to help you build a business that will be respected far and near. They may forget the name of the spring you used but the memory of the service you have given will never be lost.

There's A Harvey Jobber Near You

Drop us a card and we will send you his name and our Spring Book giving complete weights, styles, measurements and prices of over 900 different kinds of springs. Write today—you may need Harvey Help tomorrow.

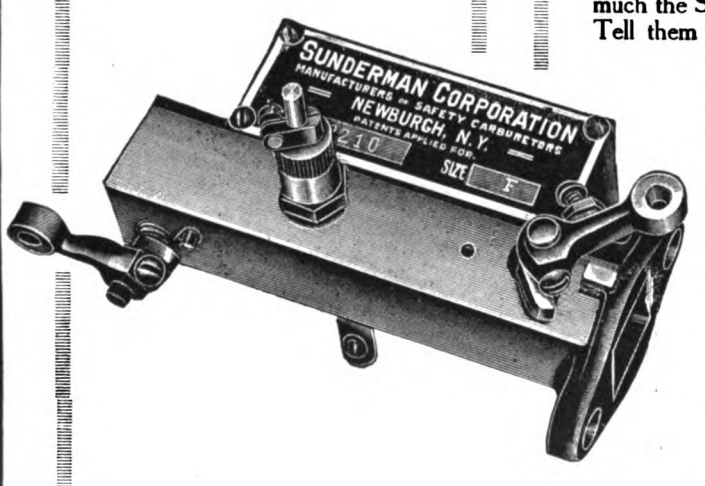
SUNDERMAN
Vacuum Carburetor

$6



F. O. B.
Newburgh

$8 and $10 for
other than
Ford or Metz

Help Your Customers to Save

That's your duty, Mr. Dealer. Every car owner wants to save—you must show them how. The SUNDERMAN CARBURETOR will save for them without sacrificing anything.

Start NOW

This is the KEY to your Winter Business

It is also the Solution of the Industry's Problem

Every car owner in the United States must save gasoline—or stop running his car all or part of the time.

If motorists do *not* economize, you will see rations of gasoline being distributed, and restrictions being placed on the use of passenger cars the remainder of the war.

Rouse Yourselves, Dealers! You Must WORK in *Self*-Defense!

If the passenger cars stop running, SO DO YOU! They will, unless their owners save gasoline. Their owners can save gasoline if you help them.

You Can Help this Way:

1. Write us at once, sending a sample order for the Sunderman Carburetor. 2. Install it on a demonstrating car (we don't care what make or model). 3. Set down on a card, and place it in your window, the mileage you have been securing from this car. 4. Tell your customers through window and counter cards and your newspaper advertising that you are going to find out how much the Sunderman Carburetor can increase the car's mileage. Tell them when, where and how you are going to make this demonstration. 5. Print the results—you will find a gasoline saving of from 30 to 50%—with a great increase of power, speed, pick-up and flexibility. 6. Get ready for the big demand for Sunderman Carburetors that will follow—a wire to us will bring immediate delivery.

That's the way to do your bit—your duty by your country, by your industry, by your **cash register.**

Get busy at once! We'll help every way we can!

Our proposition is yours for a postal—a letter, or a WIRE!

NAILING A LIE—COLD!!

We have read letters from Chalmers Distributors in which they have stated that competitors were saying to present owners of Chalmers cars and to prospective buyers, generally, that the manufacture of Chalmers cars would be discontinued.

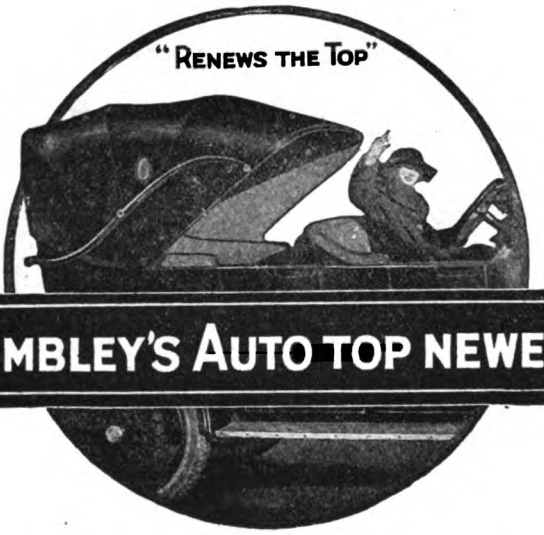
There are thirty (30) automobile companies recognized by the general trade that manufacture and sell Touring Cars, and Roadsters at retail prices between $1,100. and $1,500. We haven't heard that all of these companies or any one of them were going to discontinue production or quit business. Why then should the Chalmers, with a better car than many others in this class of 30 manufacturers, stop production?

WE Make a prophecy, and will authorize our Distributors to back it up with $200,000. of our money; that, the Chalmers Company under the Maxwell Management, will stand ahead of 15 of these companies in production in 1918, and the Chalmers Company will stand ahead of 20 of these companies in production in 1919. This doesn't look as though we expected to discontinue making Chalmers cars.

The reason some people are trying to disturb the present Chalmers owners is to scare them about service so as to get a better "trade in" on his Chalmers.

The reason for circulating such a story generally would be to prevent the prospective purchaser from inspecting a Chalmers car, because if a prospective buyer of an automobile will look at and ride in the present Chalmers models he will be very apt to buy one. It is the best car selling at $1365 that we know of.

This is one reason why Chalmers cars will continue to be made, not only in 1918, but in 1919, 1920 and other years.



Another reason is that the Maxwell organization has told the general public that Chalmers cars would be produced in larger quantities than ever before and we have a way of making good with the public on sales and production.

Walter E. Flanders

President, Chalmers & Maxwell Motor Companies.

INSIST ON THE GENUINE

FROST KING

Asbestos Insulated Radiator Cover

This high-grade radiator and engine cover will save enough *more* gasoline to many times offset the cost of its superior construction.

It has an extra thick layer of long fibred heavy Kersey, having great insulating properties. Next comes Asbestos, which absolutely keeps out cold and is the most remarkable heat retaining material known. Good quality waterproof Imitation Leather forms the outside covering.

For double wear, better appearance and better protection get the Frost King. Prices $2.75, $3.25, $5.00 up. Order early.

Dealers, order your Frost Kings now from your jobber. If he can't supply you, write us for samples and net prices.

Manufactured exclusively by

The Cincinnati Auto Specialty Company

Dept. R117, Cincinnati, Ohio, U.S.A.

ASBESTOS FROSTKING INSULATED

REFLEX SPARK PLUGS

Cold weather driving makes stern demands upon spark plugs—the temperature extremes call for a plug that has *stamina*. And the only way stamina is secured is by being *built in*. Chromite porcelain—the strongest heat-resisting insulator known—is used in every Reflex Plug.

Equip your engine with Reflex Spark Plugs and let their *actual performance* convince you that Reflex Plugs *do* "keep the car on the go!"

As a dealer, are you getting the Reflex business that you ought to have? The man who once uses Reflex Plugs becomes a steady, enthusiastic user. Let us send you a free test plug and details of our proposition.

SIZES, 1½" to 3¼"
PRICES, $4.00 to $6.00

Every motorist is quick to appreciate this exclusive, patented feature of the Petry.
Yet it's only **one** of the many constructional advantages of a cut-out scientifically correct in every detail.
The Petry Cut-Out is the first device of its kind to give permanent satisfaction. It expels the exhaust gases through a full-size megaphone-shaped vent, which greatly augments sound and facilitates tuning up of motor. Has adjustable lever, positive cut-off non-fluttering valve, and is absolutely noise-proof when closed. Spring is away from the heat. Makes a gas-tight joint of permanent rigidity without strain on exhaust pipe. Easy to install and easy to operate. A size perfectly suited to every car.

Steer Warms

MEAN

Comfort in the Car For Women in Winter

LIVE DEALERS

are finding Steer Warms great business bringers. Sell on sight to live motorists all over the cold-weather country. Make people—especially women—use their cars all winter. Help the sale of accessories and supplies. Because

Steer Warms

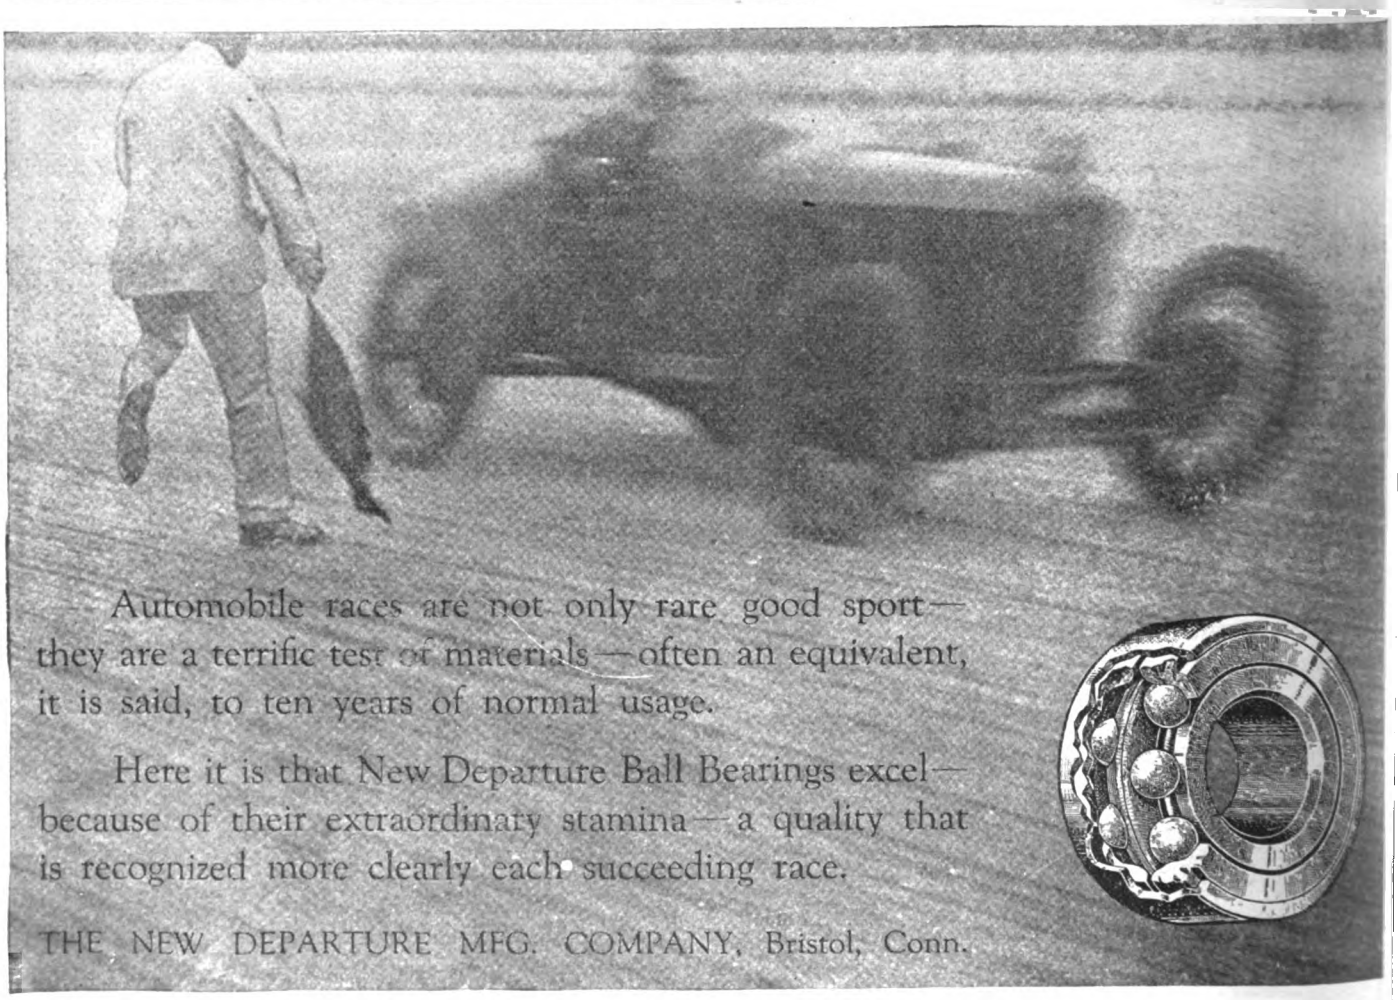
KEEP THE HANDS WARM IN COLD WEATHER

and warm hands mean the warmth all over that gives comfort and wards off "bad colds;" also limber fingers that give firmer grip and make driving safer.

GUARANTEED: Steer Warms are guaranteed against burn-out for five years; and guaranteed every other way; money refunded if they fail in anything we claim for them.

THE ONLY hand-warmers in which the heating element is protected, insuring uniform and unbroken heat. Don't experiment with infringements—get the genuine Steer Warms.

— PRICES —



For all gasoline cars, $7.50 a pair (in Canada, $11)
Special For Ford Cars, $5 a pair (in Canada, $7.25)

GOOD PROFIT TO DEALERS

Liberal discounts from retail prices give dealers good profits in handling Steer Warms and national advertising and dealers aids which we furnish make Steer Warms "big sellers." It will pay YOU to handle them.

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

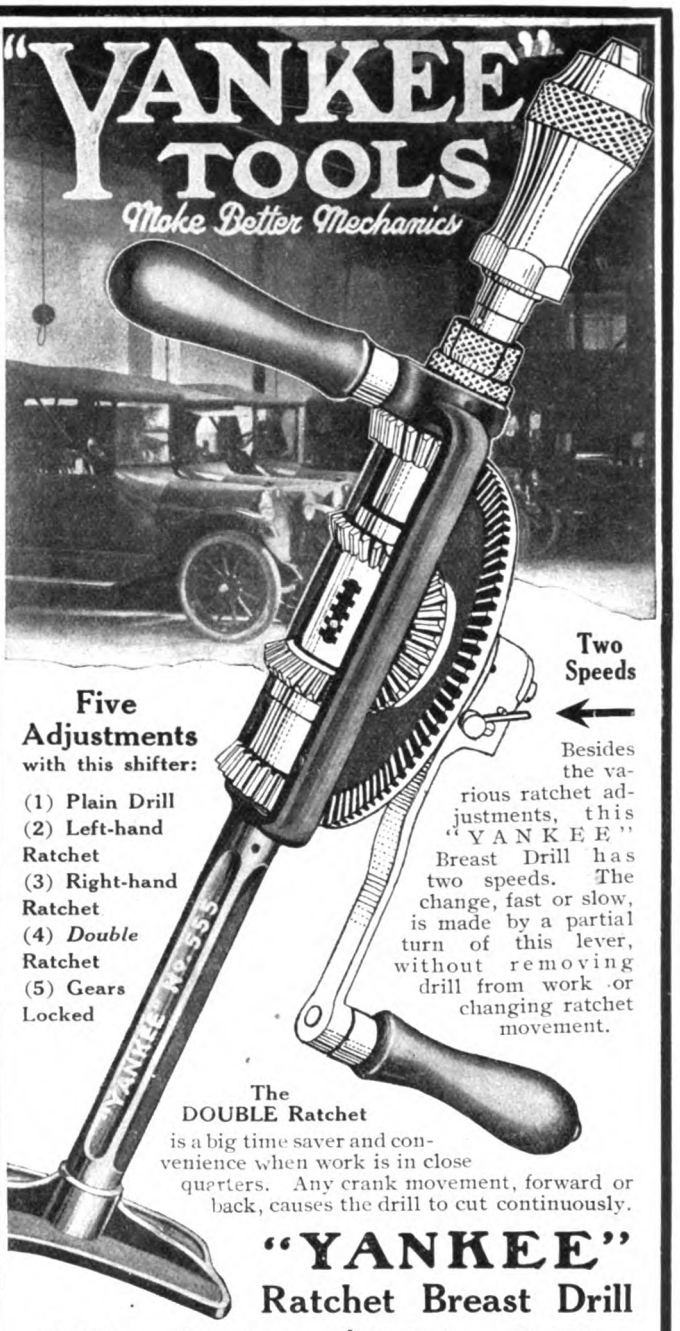
"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER



To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

"YANKEE" TOOLS

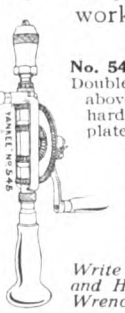
Make Better Mechanics

Five Adjustments with this shifter:

(1) Plain Drill
(2) Left-hand Ratchet
(3) Right-hand Ratchet
(4) *Double* Ratchet
(5) Gears Locked

Two Speeds

Besides the various ratchet adjustments, this "YANKEE" Breast Drill has two speeds. The change, fast or slow, is made by a partial turn of this lever, without removing drill from work or changing ratchet movement.



The DOUBLE Ratchet

is a big time saver and convenience when work is in close quarters. Any crank movement, forward or back, causes the drill to cut continuously.

"YANKEE" Ratchet Breast Drill

No. 555—Two-jaw chuck **Price, $7.70** No. 1555—Three-jaw chuck

appeals to garage men and up-to-date shop workers not only because of the time and labor it saves, as compared with any other tool for like purposes, but because it works with splendid efficiency in ways and places where no other drilling tool can be worked at all.

"YANKEE" Hand Drills

No. 545 and No. 1545—two- and three-jaw chucks. Double speed; and same ratchet movements as above, but made lighter and with polished hardwood handle instead of shank and breast plate. . . . . **Price, $6.80**

"YANKEE" Plain Breast Drills

No. 455 and No. 1455—two- and three-jaw. Double speed, but *without* ratchet movements. . . . . **Price, $5.00**

Kennedy Auto Storage Covers

"Wrap Up" Your Cars When Not in Use

When you store your car for a season, don't let its polish be dimmed by dust, and its metal tarnished before it gets out of the garage. Cover it at once with a KENNEDY AUTO STORAGE COVER, and it will remain as clean and bright as washing makes it, until the cover is removed, next day or next season.

Protects the limousine all summer, or touring cars through the entire winter season. No cost but first cost. Never wear out if care is taken in handling. Insist that your garageman use them.

Popular for Use *and* Sale in Every Garage

Garagemen—Charge extra for storing with KENNEDY AUTO STORAGE COVERS. Service your patrons are glad to pay for. Many will demand it.

Made of strong, heavy paper, reinforced to prevent tearing. Protects a car against dirt, dust and moisture. Prevents polished portions from tarnishing and keeps finish from checking in cold weather, and also prolongs the life of the tires by excluding the light. Furnished for 5 and 7 passenger gasoline cars, electrics, and Ford cars. Good profits in retail sales and service use. KENNEDY COVERS can be sold at a season when trade on other accessories is usually light.

WINTER BUSINESS—COLD WEATHER MADE PROFITABLE.

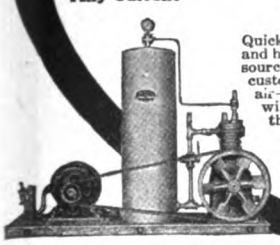
CURTIS AIR FREE FROM OIL

The Curtis Compressor is the only one designed to prevent flooding the cylinder with more oil than it needs for lubrication. This, because of our controlled-splash oiling system. No excess oil is forced into the air line. **Oil ruins tires**—air free from oil means fewer blowouts and increased mileage all around for your customers, with less tire adjustments to you. Make your place the most popular one in town. An easy and inexpensive way, is to install a Curtis Compressor. The customer assumes if you have the best free air service, you will have the best service in all departments.

Costs No More Than Ordinary Compressors—But Note The Difference

Live garages and service stations are using Curtis Air Compressors. Motorists expect free air service. Why not give them the best and win over new customers by supplying, not only reliable air service, but **Curtis Air—Free From Oil.** A poor air system which shoots oil into the tires, or which is unreliable, drives customers away. Thousands of Curtis Outfits are rendering daily, effective, efficient service all over the country. Your Curtis Compressor can further pay for itself by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools, and many other things. Curtis Compressors are backed by manufacturers who have been specialists in this line for twenty-five years.

10 Combinations of Compressor and Tank Sizes—Any Current



Five Sizes—Tight Pulley Only, or Tight and Loose Pulley

11 Combinations of Compressor and Tank Sizes—Any Current

Makes New Customers—Holds Old Ones

Quickly pays for itself in bringing in new trade and holding the old trade, for it not only is the source of a dependable supply of air when your customers want it, but it also supplies clean, cool air—free from oil. Motorists realize that oil will quickly destroy their inner tubes, and, therefore, look for a station that supplies Curtis Air—Free From Oil.

Curtis Compressors are built to meet the requirements of your business in sizes, arrangements and prices. Send coupon at once for full information and attractive prices. It will pay you to investigate our proposition. *Write us today, or ask your jobber for prices—but insist on a Curtis.*

CONNECTICUT

Lighting Switches

are the neatest, simplest and most easily installed equipment of their kind on the market.

Easily operated with a gauntleted hand.

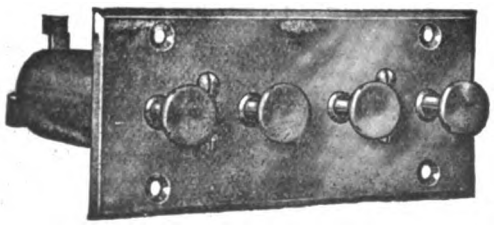
Simple construction insures unending service and satisfaction.

Connecticut switches are designed to provide every arrangement of lighting control that can be desired.

One switch for all lights, individual switches for each, or any choice of functions, individual or in combination.

HEADLIGHTS

The use of resistance for dimming the use of double filament bulbs, or the use of large or small bulbs.



HEAD, SIDE AND TAIL LIGHTS

Head and tail lamps on and off together. Side and tail lamps on and off together.

DASH LAMP

Individually or in conjunction with tail light. These are the principal functions of our standard switches but these by no means indicate the limits of control to which we are confined. Every practical arrangement has its switch.

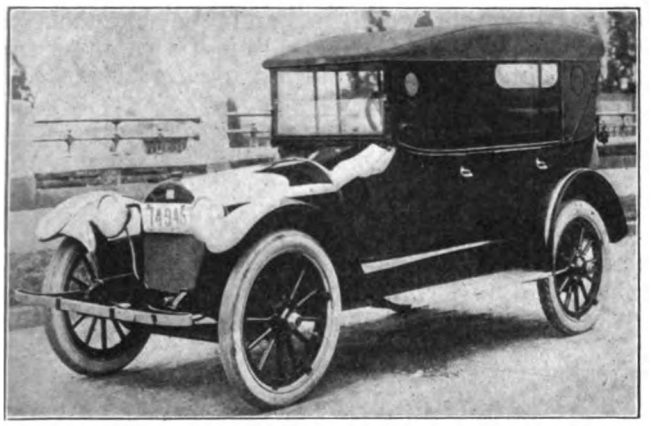
A JOURNAL OF PRACTICAL MOTORING



Registered in the U. S. Patent Office

VOL. XXIV, No. 3. NEW YORK, NOVEMBER, 1917. PRICE {10c PER COPY / $1.00 PER YEAR

KEEPING OUT THE WEATHER.

Wide Variety of Winter Enclosures Offered Owner of the Used Motor Car.

With the automobile being utilized during the entire year the manufacturer is providing comforts and conveniences obtainable with other forms of modern transportation. During the past year or two the efforts of designers have been toward the

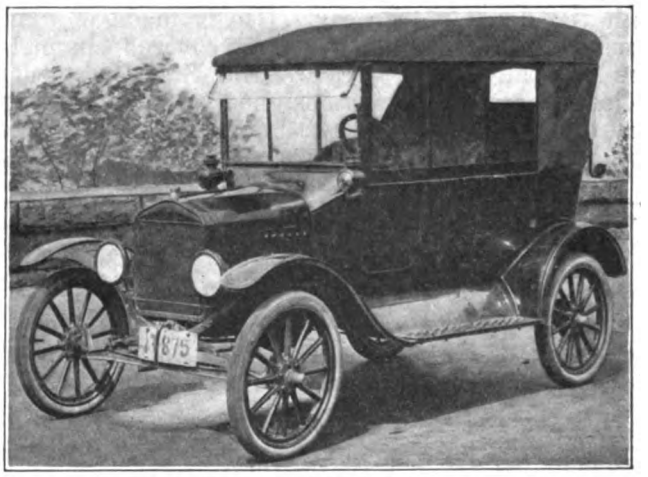
The "A-W" Convertible Glass Enclosed Top Attached to a Buick Car.

development of the enclosed body, one of the most interesting possibilities of body designing, and the owner of the used car is now offered a variety of winter enclosures. These embrace what is termed the detachable or demountable body, a design replacing the summer top, and the convertible. The first named differs from the detachable in that it provides the owner of moderate means with design that can be changed from the open touring to the enclosed type in a few minutes.

Both the detachable and convertible types are made for practically all standard makes of passenger cars, these including the roadster and touring types. Some manufacturers specialize on a number of makes, while others concentrate on one, the Ford car, for example. Owners of this machine contemplating the purchase of a winter enclosure are offered a variety of designs.

"A-W" Convertible Top.

The "A-W" convertible tops, made by the Adams-Williams Mfg. Corp., 351 West 52nd street, New York City, have been greatly improved since their introduction some three years ago. This design, which is standardized for the Ford touring and roadster cars, differs from the conventional convertible types in that use is made of heavy glass panels to protect the occupants of the machine from the cold, etc. These panels or glass are enclosed in steel frames having two small flat lugs which are inserted and locked in the door sills. When thus installed, which takes but a few seconds, the glass panels become practically a part of the door.



There are four of these door panels and these, with the other two or middle panels, are stored in a neat container and carried in the car when not in service. One of the features of the construction is that one or more panels can be used as desired. This arrangement affords a partially or wholly glass enclosed car, and with all panels removed the design becomes an open touring type. The door panels are hung at a slight angle so that when they are closed a perfectly tight joint is obtained. The construction is extremely flexible, and the maker states that the doors with panels may be slammed without danger of breaking the glass.

A Steel Construction.

The "A-W" top is, with the exception of the mohair covering, constructed of steel. It is a patented design, a one-man top, having a sliding joint which permits of its folding compactly and easily. When the top is raised it conforms to the lines of the body; that is, there is no overhang. The width is 42 inches against 55 for the Ford top. This adds to the attractiveness of the design, which is shown in an accompanying illustration with the top up and glass panels in place.

Rain Vision Windshield.

The present Ford windshield is converted by special brackets, etc., into a clear vision, rain vision type. The manufacturer of the "A-W" top states that the design can be converted from the open touring into a fully glass enclosed car in less than three minutes. The weight is said to add but 30

Illustrating the Protection Afforded by "A-W" Ford Top

pounds to that of the car, and the top is rattle and noise-proof. No alterations are made to the body. The company lays great stress upon the excellent ventilation provided. The "A-W" tops are also made for the Buick, Cadillac, Dodge, Hudson, Oldsmobile, Scripps-Booth, etc.

Digitized by Google

Anchor Line Complete.

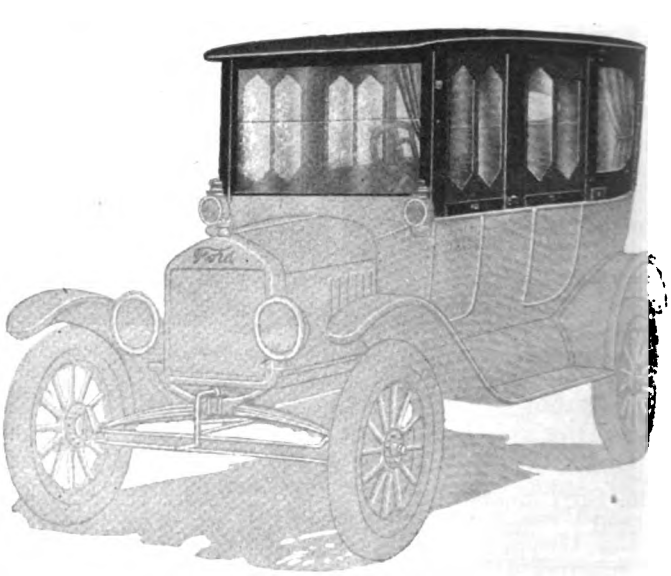
The Anchor Top & Body Co., 541 South street, Cincinnati, O., is offering a complete line of the Anchor glass enclosed tops. These are made in

Side View of Anchor Glass Enclosed Top Installed on Overland Country Club Model.

both the sedan and coupe latest styles, as well as for standard makes of cars, such as the Overland model 85-B four and six, the Country Club model 90, Buick models D-34, D-35, D-44, D-45 and E-45. Tops are made for the Oakland models 32, 34 and 50. The tops fit on the regular body irons, have no overhang and are stated not to rattle or squeak. The windows are of bevel glass, of the drop and ventilating type, and the doors open as one. The interiors are attractively lined with light whipcord cloth and each is equipped with dome electric light. The finish outside is high grade in every respect. The Anchor tops are shipped completely set up, and it is claimed that they can be readily installed on any car for which they are designed. The prices vary from $62.50 to $165, according to the car and model.

Standard Enclosures.

The Standard Auto Top Co., Philadelphia, Pa., manufactures both the demountable and what is termed the Standard enclosure. The last named, and which is illustrated herewith, is used in conjunction with the regular top, the doors opening with the doors of the car. Use is made of glass panels, these being set in velvet covered channels. The company also produces the Standard sedan enclosure, a construction designed to fit on the regular touring body when the standard top has been displaced. This is a demountable type, and is stated



The Standard, a Design for Attachment to Regular Top and Body.

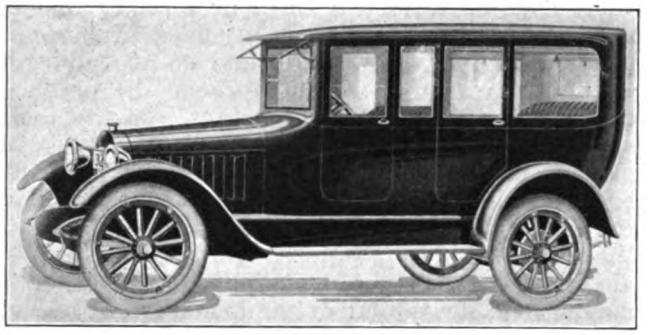
to fit the regular body very closely. This top or body comes equipped with a Troy three-way windshield, a design having an extra or projecting shield, which affords a clear vision at all times. These tops are richly upholstered, and the same material is utilized to cover the upholstery of the car. The equipment includes dome lights, pillar lamps, flower vases and grab handles. The company also produces a design for the Ford car.

Fouts & Hunter Cozy Tops.

The Fouts & Hunter Co., Terre Haute, Ind., specializes on a design for the Ford car for both the touring and roadster types. That illustrated is the touring design. The Cozy top, so termed because of the comfort it provides, fits over the regular body, and makes use of flexible as well as glass windows for keeping out the cold and weather. The side panels are of glass, while the door curtains are of a transparent flexible material mounted on a roller and travel in metal grooves two inches deep. This permits of rolling the curtain up out of the way when desired. Metal strips at the bottom make for weatherproof qualities, and the handhold is located on the inside. The automatic curtains can be raised or lowered as desired by the driver, and

The Cozy Top Having Flexible Curtains Mounted on Automatic Rollers.

this applies to both the side, front and rear members. The maker claims exceptional width or shoulder room of these curtains, which are practically doors. The roadster comes in five pieces, the touring in seven, and the maker claims both are easily attached.



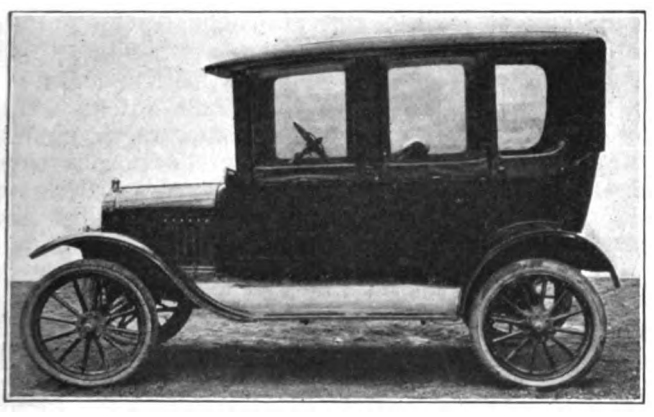
De Luxe Limousine Tops.

The Limousine Top Co., Kalamazoo, Mich., offers a wide variety of limousine tops, supplying standard designs for the Franklin, Premier, Haynes, Chalmers, Liberty and Roamer cars. The top is a combination summer and winter construction. The top doors are attached permanently to the automobile doors and are hinged to the side panels. The regular door lock is not employed when used as a winter body, however, retaining plates being utilized instead. The side panels are attached to the top irons of the car, and the windshield, which is built into the job, includes an auxiliary rain vision shield. The windshield is attached to the irons regularly supporting the shield of the car. The glass in the windows is divided so that the upper half

Digitized by Google

may be lowered as desired and for ventilation. The side panels and door frames may be removed, making the top practical for summer driving. The entire construction can be displaced if the owner desires to utilize the regular top.

The glass employed in the windows of the De Luxe limousine tops is so set in channel rubber that



The De Luxe Limousine Top Mounted on Chalmers.

it makes for a watertight and noiseless construction, the maker claims. The windows, that is, the top members, slide in felted channels.

Detroit Detachable Tops.

The Sharrer Patent Top Co., 239 West 56th street, New York City, is distributor for New York, New Jersey and Connecticut for the Detroit detachable weatherproof top made by the Detroit Weatherproof Body Co., Detroit, Mich. It is a highly developed special design for the Ford car. It provides the all-year body and can be attached without any changes or alterations to the Ford body. The maker lays great stress upon the stormproof features and the guarantee against rattle or squeaks. One of the several features of the design is the use of the patented, flexible sliding doors. These disappear into the roof when not in service. Another feature is the width afforded for the entrance and exit of passengers, the doors being three inches wider than the Ford door. Excellent shoulder room is thus provided. The Sharrer Patent Top Co. supplies a de-

The Detroit Detachable Weatherproof Top.—Wide, Flexible Sliding Doors Disappear in the Roof.

sign for the Chandler light six, Hudson Super Six, Chalmers five-passenger car and the Buick D-45.

One of the features of the Detroit detachable weatherproof top is that it can be attached by anyone in three hours. The tops are constructed of high-grade material throughout, and the workmanship and finish are first-class in every respect. Another advantage claimed of the design is that it affords the car owner an enclosed or open body for all-year service at a reasonable price.

Tires Scarce and High.

The only automobile in Germany running on pneumatic tires is Kaiser Wilhelm's. Other officials use cars that bump along to the front on tires filled with rags, compressed cork and paper, according to Victor Van der Linde, special technical representative of the B. F. Goodrich Rubber Co., Akron, O., who just returned from Europe after a long study of tire conditions abroad. In some countries tires are not to had at all, except at fabulous price.

"German scientists have tried to improvise for the scarcity of rubber by compounding what they call synthetic rubber," said Mr. Van der Linde, "but in this they have been unsuccessful. There is not an ounce of crude rubber in it at all and therefore it is devoid of fiber. Then again it has cost about fifteen times more a pound than the vegetable.

"The situation of both Germany and Austria, as concerns tires, is truly deplorable. Countries bounding the central empires, with the exception of those that are at war with them, are in just as bad plight. Most casings are stuffed with compressed champagne corks, paper, rags and sausages made of ground cork. In Sweden a tire costs $550 and one has to have a permit."

Car Stealing Statistics.

Columbus, O., holds the record as being the most successful in recovering stolen motor vehicles. Cleveland, O., is second, and Buffalo, N. Y., third. According to statistics gathered by the Cleveland Automobile Club, Detroit, Mich., is next to the lowest in the percentage of stolen cars recovered between January 1 and September 1 of the present year. The figures follow:

	Cars stolen.	Cars recovered.	Percent. recovered.
Columbus	294	264	89
Cleveland	1,375	1,214	88
Buffalo	493	432	87
Toledo	443	385	86
Detroit	3,052	2,333	76
Chicago	2,515	1,718	68

Causes of Skidding.

Whenever you follow or see a car one of the rear wheels of which slides and the other rolls when the brakes are applied, you may be sure that the driver of that machine is in danger of skidding some day and is inviting an accident. Both brakes should grip alike. If they do not, adjust them. When one wheel locks and the other revolves it affords the differential or equalizing gear a chance to become active. The use of tire chains will not correct brake troubles.

Builds Roads for Motor Cars.

Foochow, China, conspicuous for its absence of roads, is to construct a seven-mile macadam road to replace the footpaths utilized for transporting goods from the river to the city. Motor vehicles are to be employed both for passengers and freight.

It is the custom among the rich to decorate their cabriolets with flowers. For some of the cars we see limping around Flatbush century plants would be exceedingly appropriate.

LIGHTING DYNAMOS.

Defining the Common Causes of Sparking, the Function of Tertiary and Magnetic Pressure.

BY SYDNEY F. WALKER, M. E.

(No. 5)

In the early days of electric lighting dynamos for ordinary work, the variation in the current furnished by the dynamo caused a considerable amount of sparking at the brushes, unless they were moved forward and backward as the current taken from the machine increased or decreased. Modern dynamos are constructed with the magnetic pressure of the magnetic field very much more powerful than that produced by the armature current and so the tendency to increased sparking with varying currents is not serious; the sparkless dynamo at all loads has long been an accomplished fact.

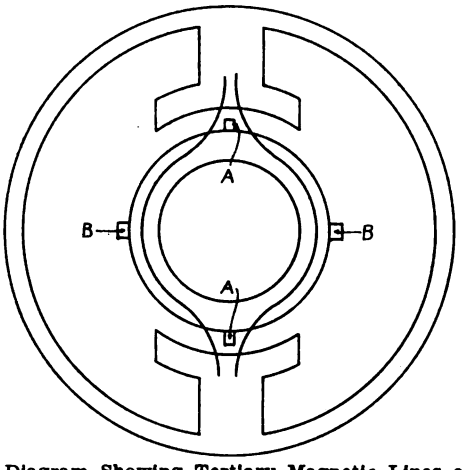

Fig. 24—Diagram Showing Tertiary Magnetic Lines of Force in Leitner System Due to Presence of Auxiliary Brushes.

With the small dynamos used for electric lighting of motor cars, the variation in the current taken from the machine would have produced an awkward amount of sparking, if it had existed, but the fact that the machine is furnishing approximately the same current at all times enables the brushes to be set in one position, where the sparking is inappreciable. This means again that the current furnished should be that which the battery will take on the flat part of the charging curve, 2.2 volts per cell; if there is much variation in the current furnished by the dynamo, either on account of the battery varying in its requirements or from any other cause, the sparking may easily be serious. The writer has seen cases where this has occurred.

Troubles Due to Sparking.

Sparking at the brushes leads to troubles of various kinds. The heat liberated by the spark tends to warm the machine up, to increase the resistance of its coils and to reduce the current it furnishes. The sparking is due, as mentioned above, to the distortion of the resultant magnetic pressure. When the current furnished is that for which the brushes are set, if the machine is properly designed there should be practically no sparking, and the brushes should run with very little attention, only such as they can receive when overhauling everything before starting in the morning. If the current is reduced considerably owing to the back pressure of the accumulator increasing considerably, the magnetic pressure due to the armature currents will be reduced, the resultant magnetic field will be changed, and with it the proper points of sparkless collection for the brushes; and hence sparking will follow.

Magnetic Pressure.

In the machines referred to in this portion of the article, in which auxiliary brushes are employed, what may be termed a third or tertiary magnetic pressure is set up, which is intended to reduce the primary magnetic pressure, and so to compensate for the increased speed and to keep the product of the two factors F and N constant. In the Leitner system, in which two auxiliary brushes were employed, both placed 90 degrees from both main brushes, the field magnet current that had flowed round one of the coils, that which was connected to the positive brush, entered the armature by its auxiliary brush, and the current for the other field magnet coil flowed out of the armature at its auxiliary brush which was diametrically opposite the first one. The currents flowing in and out of the armature through the two auxiliary brushes created their own magnetic pressure, which was directly opposed to that of the field magnets.

Tertiary Magnetic Pressure.

This is shown diagrammatically in Fig. 24. The tertiary magnetic pressure being directly proportional to the current flowing in the field magnet coils tended to reduce the number of lines of force operating to produce the electric pressure at the brushes in exactly the same proportion, so that the increased speed was directly compensated for. In the later Leitner system in which one brush is employed the results are claimed to be practically the same, but the inventor has added a number of accessories, including a bucking coil, which comes into operation when the pressure reaches a certain figure, and another apparatus throws a resistance into the field magnet circuit if the pressure is raised to the extreme figure 2.75 volts per cell.

In the Lucas system, the one in which a few turns of thick wire are employed, carrying a comparatively large current, the action is very much the same, but certain other results are produced, due to the special arrangement of the connections. As men-

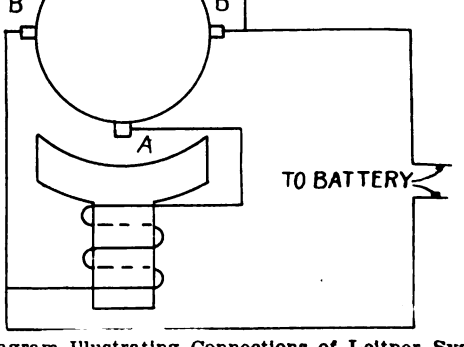

Fig. 25—Diagram Illustrating Connections of Leitner System Utilizing Auxiliary Brushes The Shunt Field Coils Receive The Current from the Auxiliary Brushes.

Digitized by Google

tioned above, a few turns of thick wire are connected between the auxiliary brush and the negative brush, the turns of wire being coiled round the field magnets in the same manner as the bucking coil, but it is not a bucking coil. It only connects the auxiliary brush with the negative brush, and it does not carry the current flowing to the batteries or the lamps; it only carries the current which can flow from the auxiliary brush to the negative brush by virtue of the difference of pressure existing between them, this difference of pressure being due to the position of the auxiliary brush on the commutator.

Under ordinary working, when the machine was furnishing say 12 volts, the difference of pressure between the auxiliary brush and the negative brush would be 6 volts, and the current flowing through the thick wire coil connected between them would be due to that pressure, and inversely to the resistance of the connecting wire.

Operation of Coil.

Fig. 25 shows the arrangement of the coils in the Lucas system. But the presence of the auxiliary brush, connected by a wire of low resistance to the negative brush, alters the conditions of the magnetic field considerably. The inventor claims that while the speed is low a considerable current flows through the auxiliary coil, which acts in unison with the ordinary shunt field coils, and therefore tends to get up the pressure quickly even at the low speed. He claims that as the speed rises, and as the pressure between the positive and negative brushes rises, the difference of pressure between the auxiliary brush and the negative brush gradually decreases, and when the pressure would rise above that which is required for charging the accumulator the direction of the pressure between the negative brush and the auxiliary brush is reversed.

Current now flows round the auxiliary coil in the reverse direction to that of the shunt field coil, the current tending to produce a magnetic pressure opposed to that of the field magnet, and therefore to reduce the number of lines of force in the same proportion as the speed is increased. The auxiliary coil is claimed to act virtually as a bucking coil after a certain critical speed is passed. The action produced by the auxiliary coil and the auxiliary brush in this arrangement is very complicated. The low resistance of the auxiliary coil would tend to bring the auxiliary brush near to the pressure of the negative brush, and the current flowing through the auxiliary brush would create its own magnetic pressure just as in the Leitner system.

Disadvantages of Method.

The inventor claims to have worked out the system by a long series of very careful experiments, and to have produced the results mentioned above. The writer will therefore leave it at that, but it appears to him that the same objection applies to the auxiliary brush method as to the bucking coil method, it commences to operate immediately the dynamo commences to furnish a pressure, and therefore the field magnet coils must furnish a higher magnetic pressure than would otherwise be necessary in order to compensate for this. In the Lucas system the object appears to be to keep the dynamo small, and to assist the pressure in the early periods of low speed.

With regard to the Mather and Platt system, which was shown diagrammatically in Fig. 8, the same principles apply, but completely new ground is broken. As indicated by the diagram, the field magnet cores, as mentioned above, have very small sectional area, while the pole pieces are very large, and embrace the armature very closely. The field magnet coils receive their current directly from the battery, as shown in the diagram; the usual main brushes are connected together by the short length of wire shown, and current for charging the battery is taken from the auxiliary brushes. The action is as follows: The shunt field coils create a very weak magnetic pressure across the air spaces between the pole pieces and the armature core, and in the armature itself, but it is sufficient to cause the flow of a comparatively large current through the armature coils and through the short length of wire connecting the usual main brushes. But the powerful current flowing in the armature coils creates a powerful secondary magnetic pressure in the manner already described, and the armature coils themselves, moving in the magnetic field created by this secondary magnetic pressure create an electric pressure between the two auxiliary brushes.

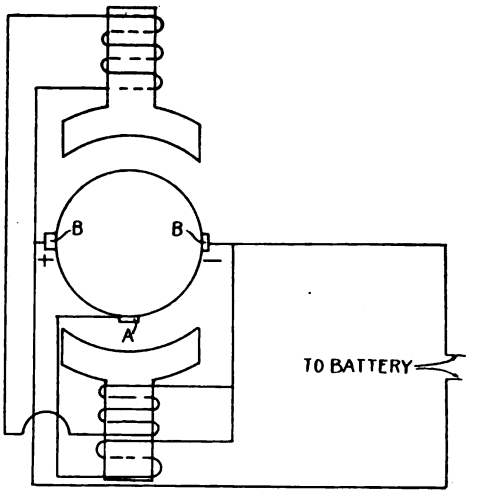

Fig. 26—Diagram Showing Arrangement of Lucas System. One Auxiliary Brush Is Employed and Is Connected to Negative Brush of Dynamo by a Short Thick Wire.

Has Peculiar Feature.

There is a peculiar feature about the magnetic pressures created in the Mather and Platt dynamo. The primary pressure, created by the shunt field coils, causes the lines of force it produces to take the usual path, across the air spaces, through the field magnet cores and back by the mass of the containing cylinder. The secondary pressure operates almost entirely around each pole piece, the air space enclosed between it and the armature core, and that portion of the armature core lying between the ends of the pole pieces. There are two secondary magnetic pressures operating in the two pole pieces, which are specially designed to accommodate them, and it is the lines of force due to these secondary magnetic pressures that give rise to the secondary electric pressure, and to the secondary electric currents flowing from the auxiliary brushes to the accumulator. The secondary magnetic pressures and the primary magnetic pressure act at right angles to each other, and are therefore quite independent of each other. No increase of the secondary magnetic pressure affects the primary magnetic pressure directly, but it does affect it through the secondary

Digitized by Google

electric current delivered by the auxiliary brushes, and flowing through them. The current flowing through the auxiliary brushes creates a tertiary magnetic pressure, which is at right angles to the secondary pressure, and therefore directly opposes

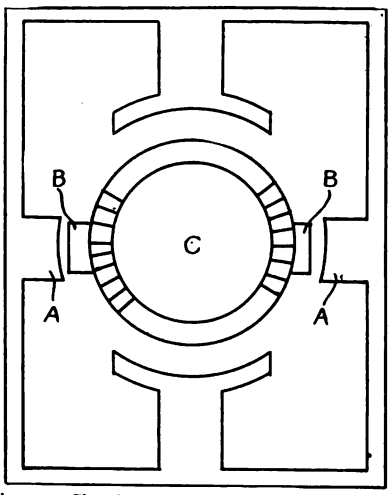

Fig. 27—Diagram Showing Section of Brolt Dynamo. Auxiliary Poles Are Employed to Keep Pressure Constant.

the primary magnetic pressure, with the result that the machine is beautifully self-regulating.

Variable Resistance.

In the train lighting apparatus there is what the makers call an output adjuster which is practically a variable resistance inserted in the circuit of the shunt field coils. By varying this resistance the current in the shunt field coils is varied at will, but once it is set, the working of the machine is automatic. Different current strengths in the shunt field coils correspond to different pressures at the auxiliary brushes, that is to say, at the terminals of the battery. The working of the apparatus, the creation of the tertiary magnetic pressure in exact proportion to the current the armature is trying to deliver, keeps the pressure at the secondary brushes constant. Any attempted increase of pressure at the secondary brushes, by causing an attempted increase in the battery charging current, automatically increases the tertiary magnetic pressure and reduces the secondary pressure to the normal. It is like the case so often met with in mechanical engineering in connection with the government of steam engines, for instance, where an increase or decrease does not arise, because a small increase or a small decrease creates the condition necessary to prevent the increase or decrease.

Auxiliary Pole Pieces.

This method is a development of the one just described, and is intended to avoid the necessity of auxiliary coils, etc. In place of auxiliary coils and auxiliary brushes, there are two auxiliary pole pieces, usually much smaller than the main pole pieces, and placed at right angles to them. Fig. 27 is a sectional diagram showing the arrangement of the pole pieces in a machine in use in the United Kingdom. It will be remembered that the flow of current through the armature coils creates a secondary magnetic pressure, the lines of force due to it modifying those due to the main electro magnet. In the apparatus under consideration, secondary poles are placed, as shown in the diagram.

Distribution Altered.

The writer believes that the system has only been employed so far with two-pole machines, and so there are four poles spaced equally around the armature. Two of them, the main pole pieces, are of the usual crescent shape, the other two being in the form of very blunt wedges. In the manufacture of this dynamo the auxiliary poles are usually cast as part of the containing case, which is generally rectangular, not cylindrical, and they appear more as symmetrical lumps in the casting. The presence of the auxiliary poles alters the distribution of the lines of force produced by the currents flowing in the armature.

A Derived Magnetic Circuit.

As will be seen from the diagram, the brushes are placed exactly opposite the auxiliary poles, and so there is what electrical engineers call a derived magnetic circuit, formed by the armature coil, the armature core, the air spaces between the armature and the auxiliary poles and the auxiliary piles themselves. But this is not the whole of the arrangement. In addition to providing the auxiliary poles, the brushes are made to embrace two or three segments of the commutator, as shown in Fig 27, and this again alters the working of the system. In order to understand how this follows, it will be necessary to explain the action which takes place when the segments of the commutator pass under the brushes.

The brushes, it will be remembered, perform the double office of receiving the currents from the armature coils and of reversing the direction in which the current is flowing in each coil as it passes under the brush. It will be remembered that currents are flowing in opposite directions in the two halves of the armature, that they enter the armature from the outer circuit at the negative brush and divide between its two halves, flowing through each side till they meet again at the positive brush, where they pass out to the outer circuit. The two coils on opposite sides of the positive brush have currents flowing in them in opposite directions, though the two currents unite at the positive brush and in the outer circuit.

Short Circuits Coil.

When two adjacent segments are under the brush, the coil which is connected to them is short cir-

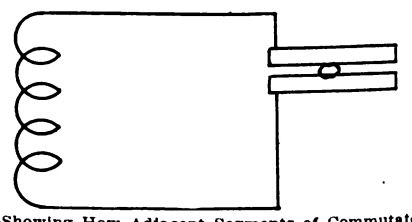

Fig. 28—Showing How Adjacent Segments of Commutator May Be Connected and the Coil Permanently Short-Circuited by Small Piece of Copper When Turning Up in Lathe.

cuited, as was shown in Fig. 17. It will be remembered that the ends of each coil are connected to adjacent segments, so that when these two segments are connected together the coil is bridged. One of the most frequent troubles with continuous current dynamos arises when two adjacent commutator segments are connected together, say by a minute piece

Digitized by Google

of copper, such as might be carried over by the tool in turning the commutator up, as shown in Fig. 28. If the spaces between the commutator segments are not very carefully cleaned out after the commutator is turned up and before the armature is put into service, a minute connection of this kind, if allowed to remain, will result in the coil connected to these two segments burning out the first time the machine runs.

Reduces Magnetic Pressure.

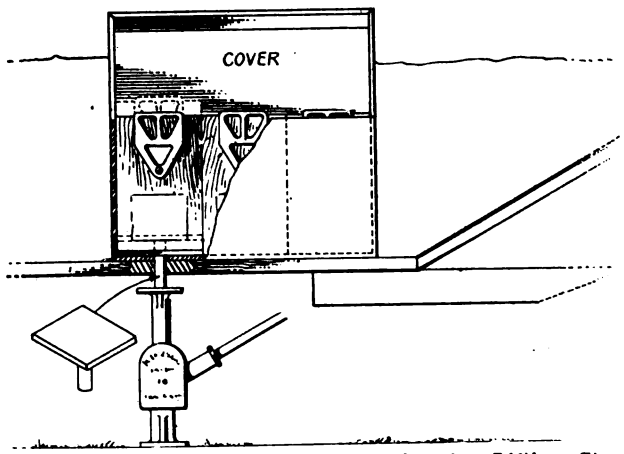
In the motor lighting dynamo under consideration, the short circuiting of the armature coils by the brush is made use of to assist in reducing the magnetic pressure furnished by the main electromagnets when the speed rises above the normal. As mentioned above, the brushes are made to embrace two or three segments of the commutator, as shown in the figure, and this means that two or more coils on the armature are short circuited, as the segments to which they are connected pass under the brushes, in place of the one coil that is usual.

This means, again, that while the two or more segments are under the brushes a very powerful current is circulating through the two or three coils, and it is creating a powerful magnetic pressure, the lines of force passing principally in the derived magnetic circuit described above, lying between the auxiliary pole pieces and the armature core. This magnetic pressure is acting at right angles to the ordinary magnetic pressure produced by the currents flowing in the armature coils, and is therefore opposite to the main magnetic pressure produced by the main field magnet, and so tends to reduce that pressure. The auxiliary poles, with the arrangement of the brushes, create a tertiary magnetic pressure which tends to reduce the primary magnetic pressure, and so to compensate for the increase of speed.

Pressure Is Constant.

The operation of the machine is as follows: When it is running at normal speed the resultant magnetic pressure, the balance of the primary, secondary and tertiary pressures is sufficient for the dynamo to give the electrical pressure at the brushes that will charge the battery at say 2.2 volts per cell. When the motor car runs faster than the usual speed, the main magnetic pressure tries to increase, but the tertiary magnetic pressure immediately reduces the resultant pressure to the normal figure, so that the charging elctrical pressure remains constant. When the back electrical pressure of the accumulator rises, with the motor running at normal speed, the action is very much the same as described with the shunt wound machine; the electrical pressure at the brushes rises automatically owing to the smaller current flowing through the armature, and the tertiary magnetic pressure should check any increase beyond that required by the battery.

Reduces Efficiency.



The writer's objection to this method is the same as that urged for the others; it is acting all the time, not only when the pressure would tend to rise owing to a rise of speed. The tertiary magnetic pressure is created at all speeds, and is constantly reducing the primary magnetic pressure at all speeds, so that the primary magnetic pressure has to be greater than it otherwise would need to be by the amount of the tertiary magnetic pressure at normal speed. This means again that the ampere turns, the magneto motive force of the shunt field magnet coils have to be greater than they otherwise would be, and this leads to a lowered efficiency. As pointed out in a previous part of this article, the magneto motive force of the shunt coils of any dynamo depends directly upon the gauge of the wire, so that a larger gauge wire would have to be employed taking a larger current, and more of the current generated by the armature than would be necessary without the arrangement described.

When the Funnel Is Absent.

When it is necessary to renew the supply of distilled water in the cells of the storage battery and a funnel is not handy, the trick can be turned much in the same manner as one pours sauce from a bottle having a glass and cork stopper. Take a small rod of glass or wood (do not use metal) and insert it in the cell opening. Then pour the water slowly and carefully on the rod. The fluid will follow the rod into the cell.

Removing Storage Batteries.

It is not always easy to remove a storage battery from the running board type of box, particularly when the battery is not equipped with convenient handles. A device for making easy the work is shown in the accompanying illustration and is practically self explanatory. It consists of a strip of wood with a round part at right angles. This is placed in the battery box, which is cut as shown. To remove the battery, use a jack and raise the battery until it can be grasped.

Illustrating an Easily Constructed Device for Lifting Storage Battery from Box on Running Board.

May Form New Association.

A movement is on foot to form a new association to control racing on certain speedways throughout the country. The name chosen for the new association is the National Grand Circuit of American Speedways. It is stated that twenty-nine drivers have been secured by the promoters for the 1918 season. The larger tracks, such as Providence, Indianapolis, Chicago and Cincinnati have agreed to stick by the Contest Board of the American Automobile Association, which controls racing in this country. The effort to form an independent racing association recalls the rivalry between the L. A. W. and the N. C. A. when bicycle racing was in vogue.

TRANSMISSION TROUBLES.

Why Gears Deteriorate and the Cause—Need of Inspection and Adjustment.

BY J. W. BAGLEY.

Many users of motor cars have little knowledge of the working parts of the transmission. Because they cannot see the gears in operation the parts are often subjected to severe service and abuse. Damage caused by changing speeds will, if let run,

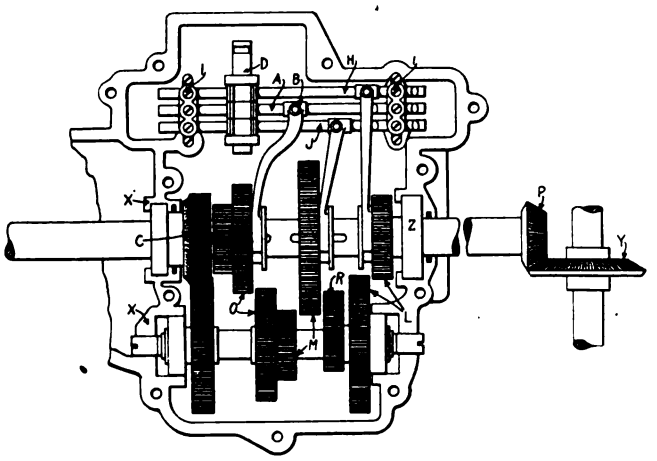

Fig. 1—A Four-Speed Gearset or Transmission.

often result in costly repairs. These troubles could be avoided if the gearset was understood.

There are times when a little lubrication at the proper time would save the car owner expense. If not familiar with the construction and operation of the gearset he should go to the garage man or repair man when minor troubles occur. Lack of lubrication causes the gear teeth to start chipping and cutting. The minute particles of steel work into the bearings and ruin them. When the glasslike surfaces of the gears are broken it is but a matter of a very short time before the gear is ruined. Lack of lubrication will also play havoc with the shifting yokes, for it allows them to wear rapidly, and when a little play occurs the gears have a tendency to crawl out of mesh, damaging the corners of the teeth to such an extent that they will not drive.

Fig. 1 illustrates a four-speed sliding gear set as used on some of the best cars. The three-speed gear set shown at Fig. 1 is very similar, except that it does not have the higher speed of the four-speed, which is obtained by bringing the extra set into use on good roads. In the drawing, D is the shifting lever. When the lever D is moved into the notch on slide bar A bringing gears L into mesh, we will have the gears in position for the lowest speed obtainable. As soon as the car is started the lever may be shifted, bringing gears M into mesh, obtaining the second or intermediate gears. This operation disconnects gears L when the lever is changed to position M. When we change the lever D, bringing gears O into mesh, we have the third speed, or what would be known as high, with a three-speed gear set. But in the four-speed gearset we have still another gear. The clutch for high speed, or direct, as it is sometimes called, is obtained by connecting the gear at C with the gear O. All other gears are in neutral except the idler V gear on the reverse gear, as shown at R. When we shift into the bar J bringing the three gears into mesh, including the idler gear, we reverse the direction of the driving pinion P and the car is moved backward.

End play of the shafts carrying the gears should be reduced to a minimum, for end play will allow the gears to slip past each other. When only a portion of each drive, and on a hard pull, the teeth are liable to be torn from the gear. Slide bar H in this instance has to do with the high or direct drive, and many times while driving along the road the gears will jump out of mesh without any apparent cause. This may be due to different causes, but the most common is the little spring locking device shown at Fig. 2. This has a ball held down by a spring which is forced into the notch in the slide bar as the shift is made. If for any reason this ball does not drop into the notch the pressure on the gear will cause it to work back and get out of mesh.

Then again this same trouble can be brought about by the yoke B being worn at the gear O, and to such an extent that the yoke will not push the gear into position. The ball will not have a chance to seat in the notch in slide bar H, in which case it will jump out of high, for the pressure has a tendency to force it back rather than into mesh. There are, of course, other things which might cause the gears to get out of mesh, but these are the most common. Many times the thrust washers Z wear so thin that they allow the shaft to play back and forth and sufficiently to disengage the gears, or allow them to only mesh on the extreme outer edges. The bearings X may wear to such an extent that the gears will separate, allowing the pressure to come on the extreme outer ends of the teeth. In this instance the gears will "howl," become noisy, and it is but a matter of a very short time before the ends of the teeth will be chipped off. When this occurs they will pass each other with a scraping sound and fail to drive properly.

There is another sound that comes from the gear box, a sort of a pound or knock. This is usually due to a corner of a tooth being broken off, picked up and meshed into the gears. When this takes

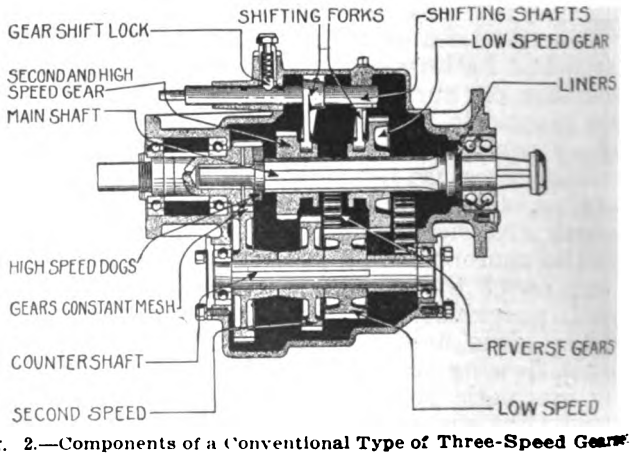

Fig. 2.—Components of a Conventional Type of Three-Speed Gearset.

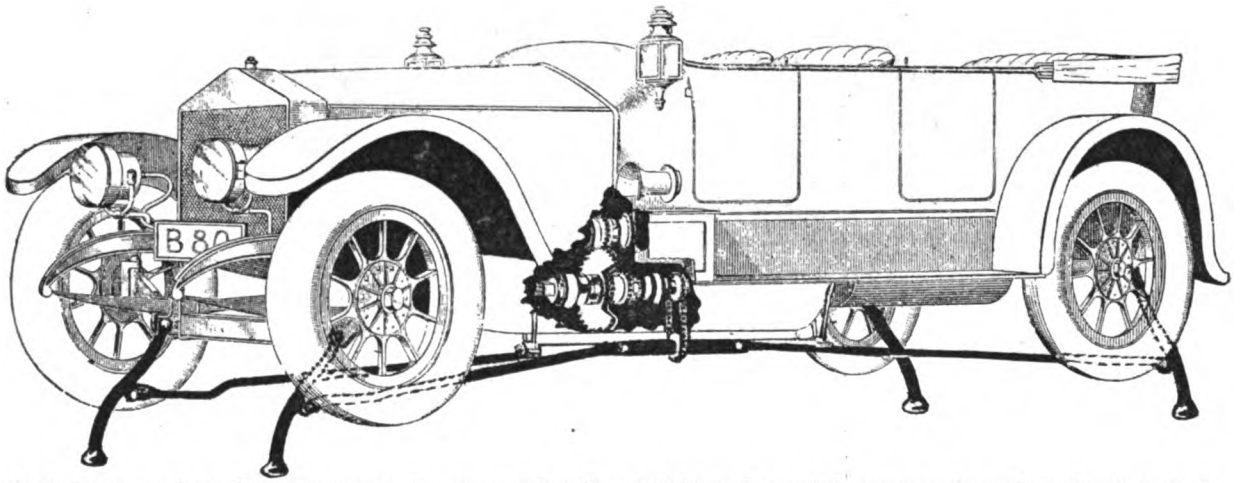
place every revolution of the gear brings the next gear over the broken piece. This should not be allowed to remain in the gearbox, for it brings about an undue strain on the bearings and shafts, and is liable to result in a badly sprung shaft. I have known of instances where the gearbox has been split, broken apart, by metal particles.

The gears of the rear axle are subject to this trouble. For instance, if a piece of metal lodges

Digitized by Google



in the gear Y, every time the pinion P passes over it a thump or a pound will be heard, a noise somewhat like the sound made by a car running on the pavement with a deflated tire. When this condition exists there is danger of springing the gear Y. It will be noisy at each revolution of the wheel. The noise is not very noticeable at a very low speed, but as the car is speeded up to 25 or 30 miles per hour the sound increases until it is very easy to hear.

The grease in the gear box should be taken out occasionally and the case washed with kerosene to remove all the particles of metal. The gears of the back axle should be cleaned also. It is not a good plan to use a heavy grease in the gear box unless it is leaky, for a light oil will lubricate much better and there is not so much danger of the particles of metal being picked up by the revolving gears.

Care should be taken in changing the gears that they do not scrape, for the scraping removes particles of metal from the teeth, which will work into the bearings. When the gears scrape in changing it is evident that the clutch stop is at fault or that the clutch does not release sufficiently to stop spinning.

The gearbox should be at all times secured fast to the frame of the car. If the case works loose the bolts holding it to the frame will soon wear and drop out, which may result in a broken shaft or a broken gearbox.

When placing the gears in the reverse position and letting in the clutch a "howling" takes place, sounding as if something was tearing loose. Many times this is due to the fact that the idler gear is loose on the stud or the bearing is so worn that the gear does not mesh properly with the sliding gear. When the idler gear is loose it should be repaired at once or it will be torn out entirely.

A Novel Jack Operated by the Power of the Engine and Capable of Raising Car and Passengers from Ground. Jack is Controlled by Lever at Driver's Seat.

Jack Lifts Car and Passengers.

A novel jack in that the car and passengers can be raised free of the ground by the energy of the engine, has been brought out in England. The Rapid mechanical self-lifting jack, as it is termed, is permanently attached to the car, and it is said that with it the largest vehicle can be raised eight inches from the ground in a few seconds.

Two different types are being manufactured, one an engine-driven device and the other a mechanical. With the first named the mechanism raising the car is controlled by a lever at the driver's seat. The hand-operated model is operated by means of a winch handle being inserted into a recess under the running board. The last named type is said to be easy to install.

The weight of the car is supported by four ball-ended hinged legs, which are normally horizontal and practically concealed from view. These legs or levers have coupling rods linked with threaded sleeves which are actuated by chain as shown in the accompanying sketch. The chain pinion operating the sleeves is actuated by the energy of the engine through the use of the engine clutch shaft. This shaft has a sleeve mounted on roller bearings and carries a small spur pinion which meshes with a larger wheel on an intermediate shaft. The sleeve also embodies a pawl clutch, by means of which the clutch shaft can be locked solid with the sleeve carrying the small pinion.

The lifting mechanism is automatically disconnected when the car is raised the desired or maximum height from the ground. This is obtained by a limit lift rod connected to forks operating dog clutches. In lowering the car the power is taken through the small and large pinions, as when lifting. Two hand-operated jacks are made. One is the design mentioned and the other consists of a type with which each wheel can be raised separately or the entire car raised. When the machine is jacked up it can be moved forward, backward, sideways or turned around in its length by means of the ball runners. It is stated that there is sufficient room under the car for inspection, etc., when jacked up. The jacks are made in six different capacities, and while prices have not been definitely fixed on account of the war, these are said to vary from $100 to $200.

Renovating Worn Bushings.

When the bushings of the steering spindle, etc., become badly worn and new ones cannot be obtained because the car is no longer being made, a repair can be effected by the following method: Remove the bushing and split it lengthwise. Cut and roll shim stock or steel and sufficiently thick to compensate for the wear of the bushing. Place this stock in back of the bushing and drive the latter in place. Ream to fit.

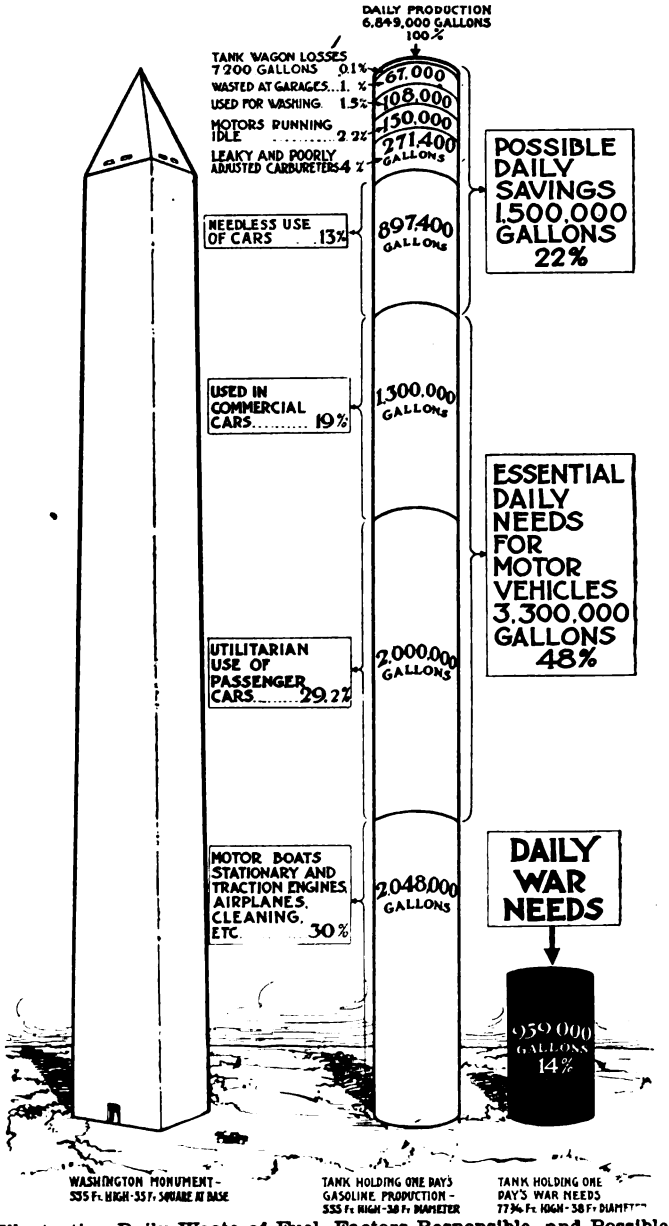
HOW FUEL IS WASTED.



Leaking Carburetors, Rich Mixtures, Etc., Cause Daily Losses of 1,500,000 Gallons.

According to figures compiled by the National Automobile Chamber of Commerce we are wasting millions of gallons of gasoline yearly, statistics

ESTIMATED DAILY FUEL WASTE.

	Gallons.
Tank Wagon Losses	7,200
Leaky Carburetors	30,400
Poorly-Adjusted Carburetors	240,000
Engines Running Idle	150,000
Waste In Garages	67,000
POSSIBLE DAILY SAVING	494,600
By Using Kerosene In Garages	108,000
Needless Use of Cars	897,400
TOTAL POSSIBLE DAILY SAVING	1,500,000
TOTAL POSSIBLE YEARLY SAVING	561,000,000
ESTIMATED GOVERNMENT REQUIREMENTS	350,000,000

showing that nearly 500,000 gallons of fuel are wasted daily through avoidable losses. A million gallons can be saved by substituting kerosene for gasoline in repair work, by avoiding needless use of automobiles, etc. This represents a total of

Illustrating Daily Waste of Fuel, Factors Responsible, and Possible Daily and Yearly Saving.

1,500,000 gallons daily, a saving that could be effected by co-operation with the government. The total possible yearly saving is estimated at 561,000,000 or 150,000,000 more gallons than required by the government to operate its vast fleet of motor trucks and airplanes now in the process of construction.

How Waste Occurs.

It is estimated that the tank wagons in transporting fuel to the garages, etc., are responsible for a daily loss of 7,200 gallons, or one per cent. Figuring and conservatively, that leaking or flooding carburetors average about one-seventeenth of a pint of fuel daily to the car, the daily loss is 30,400 gallons. The use of too rich a mixture, or an improperly adjusted carburetor, represents a daily loss of one-half a pint per engine, or a total loss of 240,000 gallons. Thus the loss through leakage and using too much fuel in proportion to the air, is four per cent. of the total. Running the engine idle is the cause of another avoidable waste of fuel. It is reckoned that one-quarter of a pint per car is wasted daily or 150,000 gallons. The waste in garages of fuel utilized for cleaning is figured at 10 pints per day, and it is estimated that there are 63,000 dealers and garages. The waste is 67,000 gallons daily.

Possible Daily Saving.

The elimination of these losses would, it is said, save 494,600 gallons daily. By using kerosene for cleaning in garages, etc., a still further saving, 108,000 gallons, would be effected. What is, perhaps, responsible for the greatest waste is the needless use of cars. This represents a waste of 897,000 gallons of fuel daily.

These figures are based on the operation of 4,212,000 motor vehicles in this country, of which number about 400,000 are trucks. Of the 6,849,000 gallons of fuel produced daily, approximately 4,800,000 gallons are used by automobiles and the balance by marine and stationary engines, etc.

The accompanying illustration shows graphically how waste of fuel may be avoided and the factors responsible for the losses. It shows that it is possible to save 22 per cent. by economical use of automobiles, etc.; that 48 per cent. is needed for the daily needs of motor cars, and that the daily war requirements is 14 per cent. The reserve crude oil supply on July 1, 1917, was 164,580,000 barrels.

Dollar Gasoline in London.

The price of gasoline is increasing steadily in England. The latest raise is 16 cents, to which is added 12 cents per gallon, which must be paid by the holder of a license before he claims his right to purchase fuel. The final cost to the motorist is $1.12. And there are motorists in this country who complain about the high cost of fuel.

Be Careful When in New York.

Motorists visiting New York with cars will do well to exercise caution in leaving their machines unattended in the city streets. The police are conducting a campaign against such owners and 97 were fined recently in one day.

After listening to an automobile salesman's chatter for an hour you don't know whether you are a client or a patient.

STORAGE BATTERY PRACTICE.

Factors Contributing to Efficiency and Demand for Longer Service.

Wm. H. Conant, a member of the Society of Automotive Engineers, read a paper on storage batteries before that body recently. In his discussion he brought up the point of high and low rates of discharge and their effect upon the plates. His paper in part was as follows:

RESULTS OF TESTS OF BATTERY AT VARIOUS TEMPERATURES.

Discharge, Rate, Amp.	Test No. I. Specific Gravity Init.	Final	Temp. Deg. F. Init.	Final	Time, Min.
100	1.280	1.240	70	75	23.50
200	1.303	1.271	70	75	4.50
300	1.290	1.271	70	76	2.50
400	1.287	1.268	70	75	1.25
500	1.280	1.260	70	78	1.25
Discharge, Rate, Amp.	**Test No. II. Specific Gravity Init.**	**Final**	**Temp. Deg. F. Init.**	**Final**	**Time, Min.**
100	1.287	1.253	32	46	20.00
200	1.284	1.265	32	44	4.30
300	1.307	1.275	33	41	1.30
400	1.293	1.265	32	40	1.25
500	1.300	1.270	32	48	0.90
Discharge, Rate, Amp.	**Test No. III. Specific Gravity Init.**	**Final**	**Temp. Deg. F. Init.**	**Final**	**Time, Min.**
100	.....	.....	....	...	.....
200	1.305	1.265	20	55	6.8
500	1.300	1.258	3	46	1.6

High vs. Low Rates.

High rates of discharge for short periods do not absorb so much of the life of the battery as long discharges at low rates, because the coating of lead sulphate over the surface of the active material in the former case is not so dense. This coating, therefore, a, is more easily converted back into its original state with less chemical disturbance of the surface and loosening of particles to fall in the form of sediment; and, b, produces less heat from the effect of the curent passing through the lead sulphate, which is a poor conductor as compared with the lead peroxide and spongy lead. Automotive service, in fact, is not as trying on storage batteries as may be believed, and with some little latitude allowed in the matter of price limitations, much better life results can be produced.

The operating demand on a starting battery today is affected by, a, fuel grade; b, cranking speed; c, engine design and manufacture.

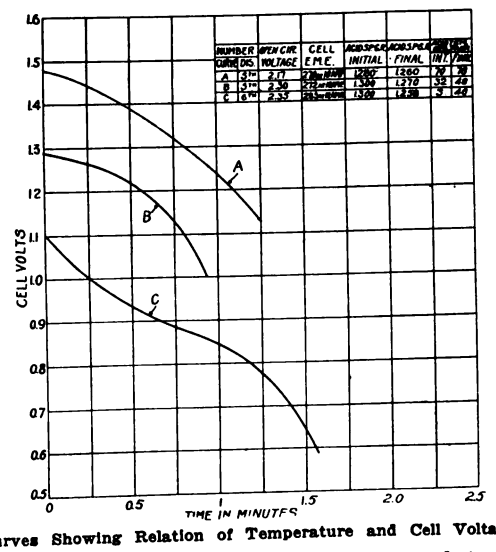
Effect of Temperature.

Under the first heading nothing need be sa[id] because the situation is so generally recognized, but when this is taken in conjunction with the higher cranking speed needed to start the same engine on poorer fuel, it is evident that more is required of the battery than formerly. If, now, under the third heading it be considered that for reasons of both design and manufacturing economy, engines today are much stiffer than formerly as well as with greater weight to be turned by the starting motor, it must be clear that more battery capacity is essential, if only enough has been used hitherto.

These considerations are sufficient in themselves, but we must also consider the maximum battery capacity available under cold weather conditions, as regards effect on fuel, lubrication and on the battery itself.

The action of low temperatures on gasoline and oil has been covered thoroughly in other papers presented before this society, and even that on batteries is fairly well recognized, but the combination of all three in conjunction with the greater demands now being placed on batteries—as previously described—probably has not appealed to engineers of automobile makers as much as it has to those connected with starting and lighting equipment manufacturers.

Battery Temperatures.



An accompanying chart shows clearly the effect of temperature on voltage and effective capacity. Curves A, B and C show the cell voltages of discharge at 70, 32 and 3 deg. Fahrenheit, respectively, the rate being 500 amperes. Attention is drawn to the increase in open-circuit and charging voltages, which vary inversely with temperature, and to the increase in the temperature on discharge at this abnormal rate. The temperature of a battery drops when it is discharged at a normal or moderate rate. It rises, however, with abnormally high rates of discharge and at an accelerating rate both for lower initial temperatures and for the continuation of individual discharges. In one minute the following effective outputs were obtained for the different temperatures: 70 deg., 11.44 watt-hours; 32 deg., 9.84 watt-hours; 3 deg., 7.84 watt-hours.

The difference in shape of curve C from that of A and B is due to the rapid rise in acid temperature as shown by the difference between initial and final readings of 3 and 46 deg.

The voltage and specific gravity during charge vary inversely with the temperature, whereas discharge voltage, ampere-hour capacity and efficiency vary directly with temperature. Internal ohmic resistance, too, actually does increase with very low temperature.

Cause of Capacity Loss.

The temporary loss of capacity in storage batteries from low temperature is due to both physical and chemical actions and may be likened to the sluggishness of the human muscles when thoroughly chilled. Furthermore, there is an internal drop in temperature that accompanies discharges at normal rates. Abnormal rates of discharge, how-

Curves Showing Relation of Temperature and Cell Voltage.

Digitized by Google

ever, raise the temperature until it mounts very rapidly toward the end of discharge at a high rate. Charging produces an increase of temperature, depending upon the proportion of charging current absorbed in the electrolytic action, so that after a battery is fairly well charged, a continuation of the same rate produces a greater proportion of heat than during the early part of charge. Low temperatures have no injurious effect upon storage batteries other than to curtail the capacity temporarily. High temperatures, however, shorten battery life both because of the effect on the thin wood separators and because the lead and antimony are attacked by sulphuric acid when hot, but are not when cold.

We observe, then, these conditions:

1. Maximum capacity is now needed from present battery equipments.
2. The attempt to obtain maximum capacity results in overcharging.
3. Overcharging produces heat.
4. High discharge rates needed for starting engines produce heat.
5. High temperature is injurious to batteries.

Need Larger Batteries.

The inevitable conclusion therefore is that larger batteries are needed to give the results demanded at present and to satisfy car owners with their longer service. In general batteries will give longer life when kept in a slightly undercharged condition than when kept overcharged. This applies certainly to those used in regulating or "floating" service, as on automobiles, if not so strongly to batteries in other service. One of the most puzzling things in automobile engineering, is the determination of life and capacity characteristics of storage batteries. Some tests have recently been made that seem to point the way toward a simple and inexpensive method of determining such characteristics.

Capacity Characteristics.

Any desired number of battery cells are connected in series and alternately charged and discharged, a clock switch being set to give any proportion of charge and discharge periods; the rate for each period is regulated in the respective circuit. All battery cells should be of the same capacity and should be connected in series throughout the test. A recording ammeter should be placed in the circuit in order to preserve a history of the cycles; thermometers should be placed in one cell of each battery; voltage readings should be taken; first, to determine whether the discharge period has been proportioned so that batteries are not discharged below a proper point and then, at intervals during the test, to know whether there is any lack of uniformity among the different cells. All voltage readings should be taken on individual cells and not on complete batteries so as to avoid observing average instead of unit conditions.

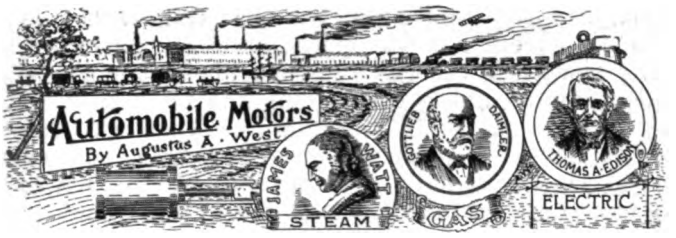
It is important in moderate or warm weather, or if tests are to be conducted at high rates, to provide artificial ventilation by means of forced draft. In a general way, it is satisfactory to use just as high rates of charge and discharge as may be desired provided the battery temperature does not exceed 110 deg. Fahrenheit at any time. A careful record of the number of cycles should be kept and capacity tests should be taken at intervals, as for instance at the end of 15, 30, 45 and 60 cycles.

These capacity tests should be taken with great care, first, to keep the discharge rate in amperes constant; second, to read cell voltages at such intervals that proper curves can be plotted; and, third, to stop the test when cells have reached the point at which the drop of the voltage curve is too steep to be useful. The previous treatment of the battery should be recorded in connection with every capacity test; that is, the number of operating cycles to which it was subjected preceding the test and the rate and length of charge before the test began. Initial and final readings of both specific gravity and temperature should be recorded.

Much interesting information is contained in the table, showing specific gravity, temperature and time readings, for a series of tests on the same battery at temperatures from 3 to 70 degrees Fahr. for rates of discharge from 100 to 500 amperes. Another paper, in fact, might be written on these results and the lessons they teach.

Canada Our Best Customer.

Canada was the principal foreign market for American passenger motor cars during the fiscal year ended June 30, 1917, the number shipped to that country being 14,421, valued at $11,143,740. The United Kingdom and France led in the purchases of commercial motor cars, the shipments to those countries being: United Kingdom, 6,525 cars, valued at $17,061,105; France, 4,264 cars, valued at $13,854,903.



Million Dollar Boulevard.

The million-dollar boulevard at Belleville, Ill., has been completed and was dedicated and formally opened to traffic recently. The road is said to be the longest continuous stretch of its kind in the country.

Three men are credited in history as having helped to bring to commercial success the several motive powers of steam, gas and electricity. Watt is known as the "father of the modern steam engine," and since his time the only great improvement has been in using the exhaust from the first cylinder to drive a piston in another cylinder, called compounding, and this is done two, three and four times in marine engines. Of minor value have been the balanced steam piston valve, the partially rotating valve of George H. Corliss and the commercial steam turbines of De Laval, Parsons and Curtis.

Gottlieb Daimler is called the "father of the automobile," although George B. Selden was among the early pioneers in gasoline-propelled carriages, and many automobile manufacturers paid him royalties for years, except Henry Ford, whose fight in the law courts over the Selden patents was successful.

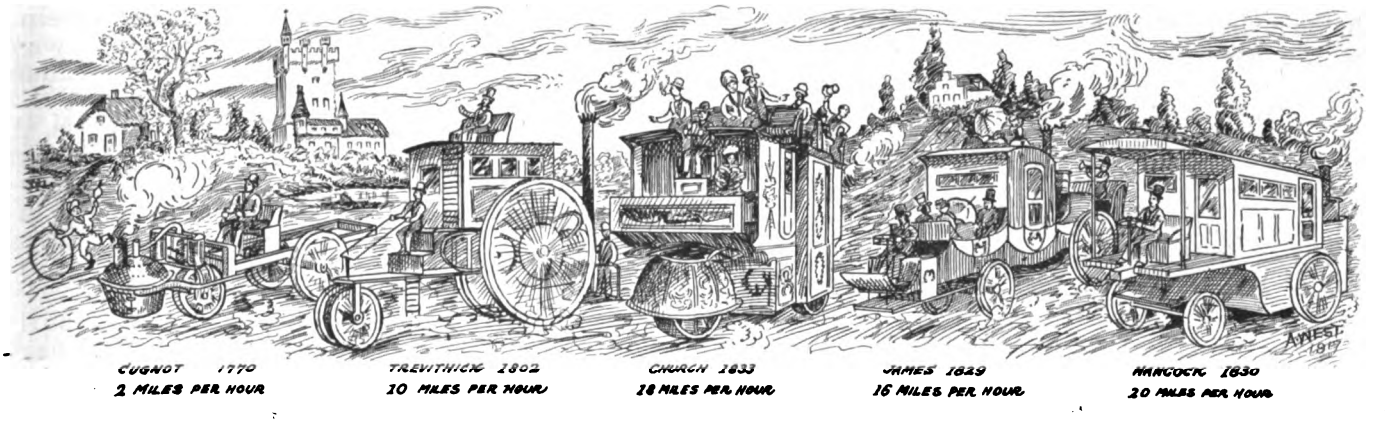
Thomas A. Edison, as an inventor in so many lines, stands out prominently among his fellow men, and no one will dispute his right to first place in electrical inventions.

Early Methods of Transportation.

For centuries man's good friend, the horse, was used to draw chariots and other vehicles. The first great improvement over the sled runners of the ancients and the tree boughs of the Indians was the invention of the round wheel. A wheel is a form of lever, and when power is applied to any part of it, it turns. The larger its diameter the faster it will revolve, and a large wheel requires more power than a smaller one.

Long before the advent of the steam locomotive there were more or less successful attempts made to propel road vehicles by steam power. These date from the steam carriage of Captain Cugnot, in 1769, but as early as 1678 Abbe Hautefeuille suggested a gun-powder motor for carriages. This dates the use of an explosive gas before an expansive gas, (steam). Nothing practical resulted from the use of gas motors until the discovery of gas, distilled from coal, by Murdock at the end of the eighteenth century.

Steam automobiles may be said to date from Cugnot's carriage in 1769 and the gas engine from the device of Lenoir in 1860, but the commercial adaptation of the gas engine to road vehicles has been claimed for either Daimler or Selden. The history of the electric motor includes many inventors, that might start with Henry's electro magnet, the well-designed motors of Davenport and their development by Edison, Field and Sprague, although the list should include the names of other successful inventors.



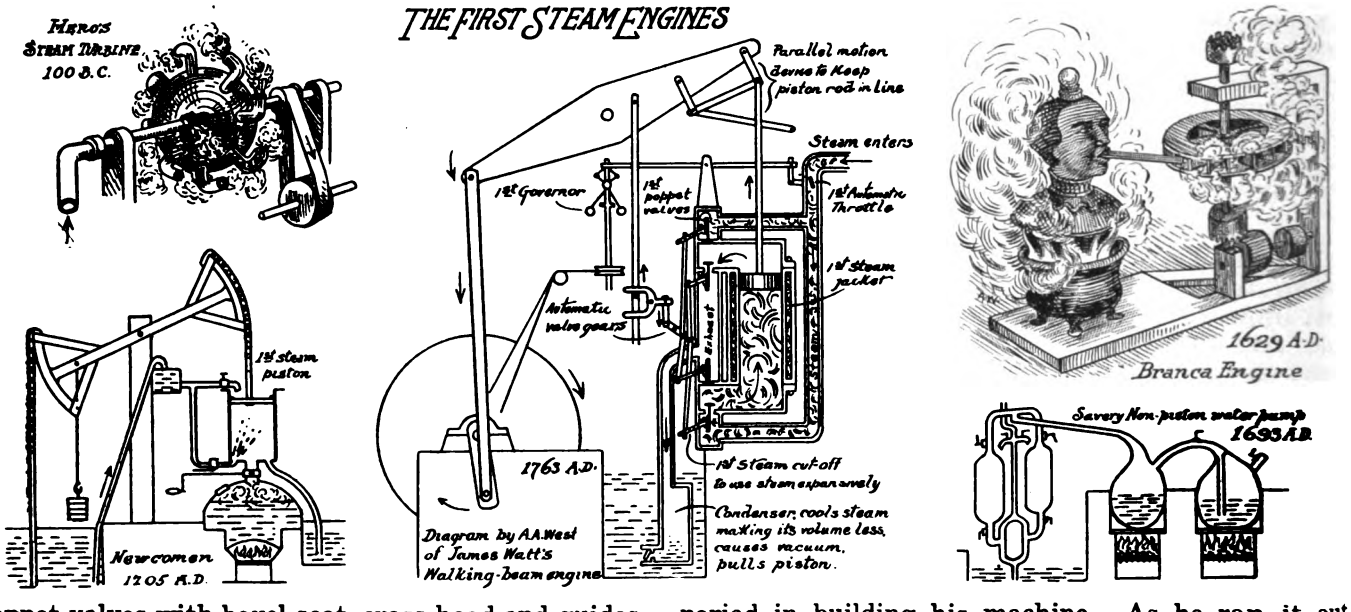
The Steam Engine.

The history of the steam engine begins with the steam toys described by Hero of Alexandria, in a book published two centuries before Christ. Later, in 1615, Salomon de Caus devised a form of steam-operated water pump without a piston. In 1629 Giovanni Branca, of Lorreto, Italy, produced a complete steam engine having a fire box, water boiler and a steam nozzle that directed steam against a form of paddle wheel or turbine. In his writings he claimed much useful merit for his engine, but it must have been very wasteful of steam, although in recent years De Laval developed this idea into a very practical high-speed motor by using a number of steam nozzles of inverted-funnel shape, that directed steam from the side onto a plurality of U-shaped vanes.

In 1693 Thomas Savery made the first successful steam engine. It consisted of two oval vessels placed side by side and having a pipe connection to a steam boiler. The lower parts were connected by tubes and valves. Steam from the boiler entered one vessel, driving out the air. The steam was then condensed and a vacuum formed by letting water play over the surface of the vessel. When the valve was opened this vacuum drew water up from below until the vessel was full. The valve was closed and steam again admitted, so that on opening the second valve the water was forced out through the delivery pipe. The two vessels worked alternately. Of the two boilers, one supplied steam and the other forced water into the steam delivery boiler. No piston was used.

The Piston Engine.

Next came the Newcomen piston engine in 1705, which was an enlargement of the Savery device. Steam acted on the lower side of the piston and a counter weight and heavy pump rod raised the piston. A jet of water was then directed into the cylinder, condensing the steam, creating a vacuum and the piston was drawn or sucked downward. Another stream of water was also played on top the piston. Thus condensing or vacuum engines came before



Digitized by Google

steam expansion engines. Today expansion of steam is made more use of than steam contraction, or "condensation of steam."

Enter James Watt.

Thus we see that Newcomen improved the device of Savery. Now come the epoch-making improvements in the steam engine. In 1763 a small model of Newcomen's engine was taken to the instrument shop of James Watt, in Glasgow, Scotland. Watt was a great genius and he made the steam engine the prime mover, until the gas and electric engine came many years afterward. Newcomen used automatic valves, invented by a lazy mine boy, but to Watt we are indebted for the poppet valve, ball-arm governor, automatic throttle, cut-off, steam jacket and other improvements.

Watt was 27 years old when he started his steam engine inventing in 1763. In 1766 he formed a co-partnership with Matthew Boulton and in 1784 Boulton and Watt erected in London a pair of steam engines that drove twenty pairs of millstones. Watt equipped them with a new flywheel, glass water gauge, mercury steam gauges, "fly-ball" governor, poppet valves with bevel seat, cross-head and guides, and several other minor improvements.

In Watt's day the term horsepower came into vogue in connection with engine power, because the early steam engines were used to replace horse-actuated mine water pumps. It was then figured that a horse could pull up a weight of 33,000 pounds a height of one foot in one minute of time. Today we call it 33,000 foot pounds per minute.

As compared with the present four-cycle gas engine, the modern steam engine is a one-cycle engine (a cycle being one-half a revolution of the crank shaft) and a steam engine gets a power stroke on each side of the piston.

Coming to the modern steam engine automobile, we find that in 1889 Leon Serpollet brought out his flash boiler, which was used in modified form by Thorncroft, Ofeldt, Walker, Geneva Carriage, Lane, Stanley, White and in the present Doble steam automobile.

Steel Was High in Cost.

The French military engineer, Nicholas Joseph Cugnot, undertook the invention of a steam-driven carriage in 1767 and 1769. At that time steel was unknown except hand-tempered steel for knife and sword blades. Steel was an expensive luxury, being made by hand up to 1855, when the price of steel was $350 a ton. In 1855 Henry Bessemer tried the experiment of injecting air into a crucible of molten metal. He finally built a stationary vessel, 3 feet in diameter by 3 feet high, out of fire brick.

This "converter," as it was called, was enclosed in a box known as the blast box, from which pipes, or tuyeres, entered the sides of the converter at the bottom. A pipe connected the air-blowing engine and the blast-box. Near the top of the converter was a vent hole for the flame produced by the operation. Great commotion took place when air was forced into the converter, the oxidation of the carbon and silicon producing a miniature volcano. Later came the Martins-Siemens "open-hearth" process, which has now a greater vogue than the Bessemer method, owing to the greater proportion of ores being more suited to the Martins-Siemens treatment.

Cugnot used such metals as were common at that period in building his machine. As he ran it out on the road near his workshop, the French citizens were amazed at its chug, chug, and it traveled at the great speed of two miles per hour for 15 minutes, when he stopped and refilled the water tank. While operating it he tried to turn it around in the road. Being top heavy, it canted and ran into a building, overturning and was wrecked. Quite a number have been wrecked on our roads in more recent years. In 1771 Cugnot built the carriage shown herein, which won him a pension from Napoleon, but it was never used for hauling cannon, as intended, because of the French Revolution. The machine is preserved in the Conservatoire des Arts et Metiers in Paris.

In 1787 the British engineer, William Murdock, built a steam tricycle. In 1802 came the steam carriage of Richard Trevithick. In 1826 Sir Goldsworthy made a steam carriage that ran 20 miles per hour and had the first "flash boiler," or combination boiler-tube-fire-box.

Between 1829 and 1838, Walter Hancock built nine steam carriages and these were used commercially. Then there were the steam carriages of Russell, James and Church.

AMONG MICHIGAN GARAGES.

Starting in Traffic—Adjusting the Carburetor—Loose Connections.

BY JAMES F. HOBART, M. E.

A certain driver was observed to always start very easily and promptly after having been stopped at a street crossing by the traffic officer. A friend, who also drove an automobile, found that by the time he got started after the officer motioned him to proceed that his friend would be half a block away, asked the gentleman how he managed to get started before the officer had time to let his hand fall after giving the go-ahead signal.

"It's just this way," said the quick starter: "When I stop my car I place it in low speed, then when the officer says 'go ahead,' I just let in the clutch, press down the accelerator a bit, and I am off and away without having to get the lever out of neutral. It is a good dodge, and saves me a whole lot of time when I am in a hurry and when I want to get started before the other fellow."

A man came into a repair shop with a car which limped at times and at other times ran very well. A search was established for the trouble and more than an hour was spent vainly before the cause of the trouble was discovered in a loose electrical connection.

The parts which should have been screwed solidly together were found to be separated, even when seemingly the screw was tightened fully. This apparent paradox was found to be the result of oxidization. The connection had become loosened and a corroding moisture had gotten into the connection and rusted the screw, the nut, and also the connection which should have been clamped between them.

After a study of the parts it appeared that the metal had oxidized enough so that when the nut was seemingly screwed down tight upon the connector that it really bore upon the coating of oxide instead of against the connector, which remained slightly loose.

It was further discovered that when the automobile was going up hill the connector would hang in a way which secured good contact, but while the machine was going down hill the contact between the parts was often broken by the "hang" of the connector. Thus the car often misfired when running down hill, but worked fairly well while going up hill, save at times when rough spots and the jolting of the car threw the rusted connections apart.

Truly, electricity lives up to the words of the man who said: "You don't know when you've got it or when you haven't got it!"

Adjusting the Carburetor.

Recently an auto was heard standing in the street running in a most peculiar manner. For three or four puffs the exhaust would be fast and then gradually slow down and the sound grow fainter and fainter until the end of a cycle, when the engine would start fast again, the exhaust "bark" harshly for three or four puffs and then dwindle down again.

"Bill is just adjusting the carburetor," said the owner of the car as he came into the house. "The carburetor has not worked very well lately, so Bill has been adjusting it about all day and hasn't got it working right yet."

"Yes, and he won't get it to work right," spoke up a gentleman in the room. The carburetor is one thing about an automobile which should be let alone. If no "adjusting" is done after the appliance comes from the factory, none will be needed. It is only after some person has "monkeyed" with the carburetor that something needs doing to it, and I cannot express myself too strongly in regard to the matter that carburetors should be left severely and entirely alone insofar as adjustments are concerned. It is all well enough to take care of the carburetor and keep out or remove any water or other foreign substances which may have gotten into it, also to see that the float is o. k. and working properly. These things should not be called "adjustments." Better call it the care necessary for the proper working of the very necessary attachment.

Then let the rest of the carburetor severely alone and fire any chauffeur or mechanic who dares place a wrench upon the carburetor to make "adjustments" therein. Do this and your car will never act like the one outside which continues to vibrate seemingly between influenza and the asthma!" And thus speaking the gentleman, who proved to be a prominent manufacturer of automobiles, went his way and left the automobile owner thinking deeply of carburetors and of his wheezing car and "adjustments."

When a man is continually "tinkering" around his car, using wrench and hammer just for the purpose of "seeing what he can do," there is every chance that he will get a whole lot of things "out of whack" and put the car into far worse shape than before he commenced to tinker.

It is all right to make little repairs, and they should be made "just before they are needed." Then the car will always be in commission, ready for the hardest service which should be demanded of it, and the repair bills will be the lowest possible. But such repairs are far different from the "tinkering" which some people inflict upon their cars. For examples of both, take the matter of inlet valves. The "tinkerer" may take out the valves, look at them, imagine perhaps that the valve stems have been sprung and attempt to straighten them, and perhaps thereby doing actual damage to the valves, which were really in good condition before he "tinkered" with them.

The man who actually repairs his automobile will, upon looking the valves over, find out if they close tightly or not. If they prove leaky, he will proceed to grind in the leaky valves and will not worry himself about possible crookedness in valve stems which are as straight and as true as they can be made.

Such is the difference between the two classes of men. One really does what is needed and does it before the wear has become great enough to cause much loss of compression. The "tinkerer," on the other hand, is pretty sure to get out of adjustment parts of the mechanism. Such men are a great benefit to the service stations, garages and repair shops, yes, and to automobile manufacturers, too, for one of these men will wear out two or three cars to one worn out by the man who makes only necessary repairs and who makes them "just before they are needed."

When a car driver complains that he cannot get more than nine or ten miles per gallon of gasoline, then look twice to make sure that he is not one of the "tinkerers" mentioned in a preceding paragraph.

Automobile Dealer and Repairer

A Magazine of condensed and compact information for busy readers.

Member of the Audit Bureau of Circulations.

Member of the Associated Business Papers.

PUBLISHED THE MIDDLE OF EACH MONTH BY

THE MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, New York

Telephone, {7377 / 7378} Barclay Post Office Box 654

CHICAGO OFFICE, 608 SOUTH DEARBORN STREET

Entered as second-class matter at the Post Office in New York City.

M. T. RICHARDSON, President and Treasurer — F. R. WHITTEN, Secretary

F. R. WHITTEN, Advertising Manager

F. M. DAMPMAN, Eastern Representative — H. F. LUDINGTON, Western Representative

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Foreign Subscriptions ..... $1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK NOVEMBER, 1917.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

THEFTS OF MOTOR CARS ARE INCREASING.

From January 1 to October 15, 1917, the police department of New York City reports that 1,725 automobiles were stolen, within the city limits.

This is an increase of 40 per cent over a similar period in 1916. Arthur Woods, police commissioner, has requested the corporation counsel to draft a law compelling car drivers to lock their machines when they are left in the streets, for any purpose.

It seems that most of the cars were stolen between the hours of 11 p. m. and 5 a. m. The police have been instructed to take all cars left in the streets unattended to the nearest police station and hold them until the operators claim them, and when that happens they will be served with a summons to appear in court.

There are so many excellent devices on the market for locking cars that it seems strange that any car owner would for a moment think of leaving his car without locking it.

VALUE OF DEMONSTRATIONS.

Dealers should not overlook the possibilities afforded by the proper display of winter equipment, supplies, etc. The "silent salesmen" method of showing goods is being highly developed, particularly in the large cities, and explains to a certain extent why one dealer is more successful than another. Of course, salesmanship is a big factor in sales, but the attention of the prospect must first be secured. For example, the dealer handling a winter top or enclosure will achieve greater success if he shows the top in actual service or on a car. Similarly those devices and equipment in demand in the winter should be displayed and on the car when possible. The majority of purchasing owners are practical. They desire to see the article or device installed or attached and in operation when possible.

DIFFICULT STARTING OF ENGINE.

To start an engine in cold weather is not always easy, particularly those engines not equipped with priming cocks or devices for enriching the mixture. It means tampering with the adjustment of the needle valve of the carburetor. The new owner, however, hesitates to change the carburetor adjustment, and as a result he expends much energy in attempting to start the engine. If agents or dealers would instruct the new owner in adjusting the carburetor for starting when cold, and with the popular type of car mark the dash adjusting device for starting, there would be less complaints noted and more satisfied owners.

EASILY ACQUIRED KNOWLEDGE.

New devices for reducing the cost of motor vehicle operation and maintenance, for simplifying its repair, are being brought ut daily. The owner who would keep maintenance cost at the minimum, who would enjoy the comforts and conveniences made possible by modern equipment, and the dealer and repairman who would simplify the repair of motor cars, should keep advised as to the new devices being marketed. Every dealer, repairman and garageman should be in a position to supply his customers with exact information as to any new device, accessory or equipment, knowledge that is easily acquired by reading the advertising as well as the reading sections of our publication.

THE OUNCE OF PRECAUTION.

An occasional inspection of the components of the chassis, particularly the steering gear, wheels, etc., those parts upon which safety depends, may avoid the possibility of a serious accident. It is not uncommon to read in the daily press that the accident was due to the steering gear "going wrong" or a wheel coming off. A search for possible loose nuts, bolts, etc., and the application of the wrench, will do much toward avoiding the possibility of accidents.

BRAKING IN AN EMERGENCY.

Eternal vigilance is the price of safety. The driver of the motor car, particularly the operator of a machine in crowded traffic, who drives with the foot used for braking either on the accelerator or on the floor, is not prepared to make a quick stop in a sudden emergency. Many times it is necessary to bring the car to a full stop in a fraction of a second. This cannot be done if the foot is not in close proximity or actually on the brake pedal.

A FOOLISH PRACTICE.

In these days when the government and people are grappling with economic conditions, when money, food, clothing and material are pressing needs, it seems sheer waste to spend money on Christmas presents that the recipient does not want or cannot

Digitized by Google

put to a useful purpose. The practice of the American public to make Christmas gifts just for the sake of making a gift, is a foolish one that should be discouraged in these times. An enormous saving can be effected by the use of good, common sense. If one must make a gift, let it be one that is practical, a gift that is a necessity not a luxury. Of course, we must except children, for with them Christmas is, oh, well, it's Christmas.

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.
The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusable accident of a collision at a railway crossing.

The number of inexcusable accidents, those resulting from collisions with railroad trains, is increasing. At Hazelton, Pa., recently, the Buffalo flyer of the Pennsylvania railroad struck an automobile, killing three outright and injuring two other occupants. The accident occurred in the day time, and although the view of the tracks was obscured at the point where the crossing was located, that could be no excuse, as the driver should have stopped his car and made an investigation.

While attempting to cross a railroad track at Perth Amboy, N. J., just at night, recently, a jitney bus was struck by a train and two of its occupants killed. The driver ignored the bell signal, which was ringing, and took his chances on crossing in time to avoid the train.

One man was killed and one injured at Mt. Holly, N. J., recently. They were struck by a freight train at a railroad crossing. The alarm bell was ringing, but the driver claimed he did not hear it. He should have stopped until he had a chance to see the track.

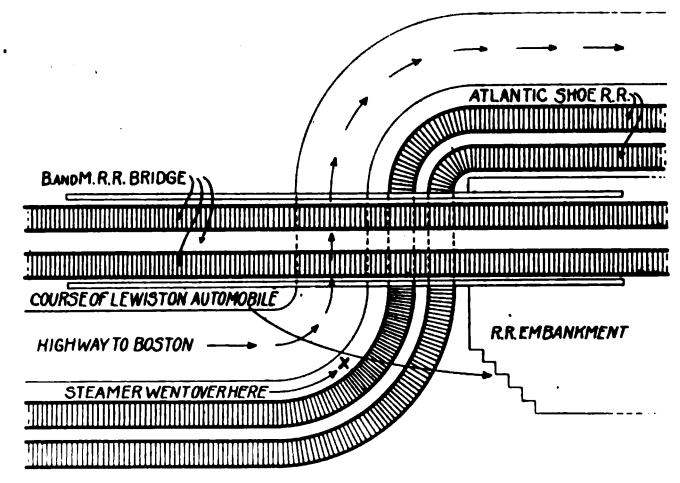
At Hoquiam, Wash., recently, an automobile in which a woman and her baby daughter were riding stalled on the railroad track, and both were killed. Three others were seriously injured, including the driver.

Caused by Liquor.—It goes without saying that any man who drinks even moderately has no business to drive a motor car. He not only endangers his own life, but the lives of those with him. At Norfolk, Va., a big touring car was wrecked while being driven at reckless speed by a man who was under the influence of liquor. Previous to the car being wrecked, it had collided with three automobiles and a buggy.

Speed Results Fatally.—Going at a high rate of speed at Newark, N. J., recently, a car plunged through the guard gates of an open draw-bridge into the Passaic river. One of the two men in the car was drowned. This is the second accident at the same bridge. Last spring seven young men attending an academy in Montclair, N. J., running a car at a high rate of speed, went through the guard gate and into the river. Three of the young men were drowned. Both of these accidents, of course, resulted from carelessness.

Running Too Fast at a Curve.—Lack of care on the part of car drivers at sharp curves results in many serious accidents. The other day one woman was killed and three others seriously injured at a curve when the driver tried to make a quick turn with a heavy touring car in a thick fog. The nut retaining the left front wheel had worked loose, and at the turn the wheel flew off. The machine plunged down an embankment, crashed against a tree, and was overturned. This accident not only shows the importance of care at curves but also the necessity of looking over one's car frequently for loose nuts or anything else that may be out of order.

Too Much Speed.—At Valdosta, Ga., five negroes were riding in a car at a high rate of speed when a hog darted into the road, and in attempting to avoid the animal the driver was thrown through the windshield and literally beheaded. The car, it was said, made three distinct somersaults.



Caused by Skidding.—One woman was killed and five other persons seriously injured at Thompsonville, Conn., recently, when a car in which they were riding, though going at a low rate of speed, skidded upon the glassy surface of the road and finally turned turtle. A case where chains were needed.

Due to Speeding.—One woman was knocked unconscious and three other people were more or less injured at Billerica, Mass., when the touring car in which they were riding plunged down an embankment.

While running at a speed of 70 miles an hour in a suburb of Chicago, Ill., over the Dixie highway, two men were killed and four seriously injured when the car skidded and overturned.

A Dangerous Crossing.

From F. B. Randall, Maine.—Your valued magazine gives me a lot of good information, especially the Trouble Department, which is certainly worth the price of a year's subscription. I like to read of the other fellow's experiences, as I know that experience is our best teacher. While reading your Lessons for Drivers just now, thought I would write

A Dangerous Curve on Road from Portland to Boston.

of one of the most dangerous places on the road from Portland to Boston, known as Dead Man's Curve, which was under the Boston & Maine rail-

Digitized by Google

road bridge in the town of Wells. Here three Lewiston women and one man met instant death, and another Lewiston man who was driving a large car miraculously escaped with his life recently as they were bound for Ayer, Mass., to visit a friend who is training there. As near as can be learned from the driver, the steering gear suddenly went wrong, the car leaving the road, plunging over an embankment, turning turtle and throwing its passengers headlong against the railroad embankment, which is a solid granite wall. Tonight's paper describes another narrow escape that happened to a steam car at the same place last night, when one rear wheel dropped over the four-foot embankment between the highway and the tracks of the Atlantic Shore Line railway which run alongside of the road and under the Boston & Maine railroad bridge. The selectmen of Wells have petitioned the Public Utilities Commission to see what can be done to abolish the curve and make the road straight and safe for travel.

M. A. M. IS ACTIVE.

Adopts Program for New York Meetings—Rules on Pirate Parts.

Closely following the first credit convention to be held by the Motor and Accessory Manufacturers at Cleveland, O., recently comes the announcement that at the monthly meeting the organization decided that action against the pirate parts manufacturer is a matter for the individual manufacturer only. According to their counsel, the best method of attacking the pirate part maker is to sue him when he creates damage, the attorney holding that it is an individual problem of individual fraud.

The annual banquet of the association will take place January 9 at New York and the following committee has charge of the arrangements: Wm. M. Sweet, chairman; E. H. Broadwell, T. J. Wetzel, J. H. Foster, Christian Girl and C. E. Thompson. The program for the show week in New York is as follows: Wednesday, January 9, 9:30 a. m., meeting of the executive committee, M. A. M. offices; 10 a. m., meeting of banquet committee; 10:30 a. m., meeting of finance committee; 11 a. m., meeting of board of directors; 3 p. m., fourteenth annual meeting, Waldorf-Astoria. The meeting of the board of directors for the election of officers will be held Thursday, January 10, at 2:30 p. m.

The following new members were elected: Menominee Electric Products, Inc., New York City; G. L. W. Spring Oiler Co., San Diego, Cal.; Central Steel Co., Massilon, O., and Kales Stamping Co., Detroit.

Technical School for Mechanics.

The annual report of the Technical School for Automobile Draftsmen and Mechanics, 20 West 44th street, New York City, shows that the year ending August 31 was one of the best since the establishment of the school in 1880. The school is the result of the demand of the automobile industry for trained men, and since its inception has been and is given the support of leading manufacturers. During the fiscal year there were eight day and 56 evening students. Of the evening class 38 were body makers, nine general woodworkers, eight draftsmen, two foremen, one timekeeper, one office man and one superintendent. The annual exhibition of drawings was well attended.

The following is the report for the work accomplished during the past year, September 1, 1916, to August 31, 1917, inclusive:

New students, 51; drawings received, 1,135; examination papers received, 170; lesson papers sent out, 2,551; rating cards sent to students, 1,305; letters sent to students, 1,465; letters received from students, 1,407.

Dodges Win in Ford Suit.

The suit of John F. and Horace E. Dodge, stockholders in the Ford Motor Co., and against that concern, has been decided in favor of the plaintiffs. The suit was brought to compel the Ford company to disburse the accumulated dividends to the stockholders instead of utilizing the money to increase the business. It is said that about $60,000,000 was involved.

The Dodge brothers, who are stockholders of the Ford Motor Company, attempted by injunction to prevent Ford from using his company's profits to erect great blast furnaces at River Rouge, near Detroit.

Ford, in a formal statement made public some time ago, and in his testimony at the trial of the suit, declared that he would appeal the case to the United States Supreme Court if the lower court's decisions were against him.

It was charged by the Dodge brothers that Ford was supreme in directing the business of the Ford Motor Company, and that the minority stockholders had no voice in the affairs of the company. Ford denied this charge. One of the officers of the company testified that it was not uncommon for the company to spend from one to five million dollars for materials, without asking for the stockholders' approval.

NEW BOOKS RECEIVED.

Acknowledgment is made of the following books and house publications:

The Japanese Salesman. Japan Sales Co., New York City. Monthly publication for acquainting American business concerns with prices, qualities and general market conditions in Japan, etc.

Glossary of Aviation Terms. By First Lieutenant Victor W. Page, U. R. S., and First Lieutenant Paul Montariol, French Flying Corps. The Norman Henley Pub. Co, New York City. Contains list of common aeronautical terms in English with French equivalents, and in French with corresponding English words. The text is in four sections, these dealing with flying field terms, the airplane and its parts, engine parts and tools and shop terms. Price $1.00.

How to Sell Automobiles. By C. D. Paxson, Cleveland, O. Outlines in detail and comprehensively the knowledge necessary to sell motor vehicles. Price $1.00.

Lubrication. The Texas Co., New York City. Monthly. Contains interesting data on lubrication, oil, etc.

Rules of the Road. The Greer College of Motoring, 1521 Wabash avenue, Chicago, Ill. Contains a digest of local and state motoring laws. Free copies will be mailed upon request.

Concrete Highway Magazine. Portland Cement Association, 111 West Washington street, Chicago, Ill. Deals with the use and service of concrete highways, etc.

Auto Suggestions. The Northwestern Chemical Co., Marietta, O. A monthly publication of interest to both the motorist and the dealer. As the name implies, it contains timely suggestions.

Drill Chips. Cleveland Twist Drill Co., Cleveland, O. Illustrates types of drills and has other interesting information.

Chevrolet Review. Chevrolet Motor Co., Detroit, Mich. Monthly publication devoted to interests of company.

The Haynes Pioneer. Haynes Automobile Co., Kokomo, Ind. Monthly house organ.

Duplex Doings. Duplex Truck Co., Lansing, Mich. Issued monthly and deals with the doings of the product of this concern.

The Stewart Lever. Stewart-Warner Speedometer Corp. Ten cents the issue. House organ.

New Departure News. The New Departure Mfg. Co., Bristol, Conn. Issued weekly by and for the employees of this company.

Digitized by Google

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2241 The Delco Circuits, Etc.

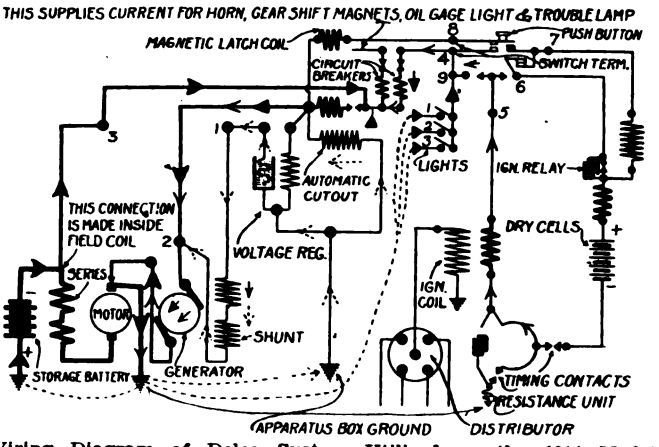
From R. A. Perez, California.—As you have all kinds of wiring diagrams, I wish you would look up that for the 1914 Cadillac.

You will see by said diagram that the storage battery is grounded from the positive terminal. What I desire is a complete explanation of said diagram. I will give you my understanding of it and request you to correct me if my understanding is not correct.

(1) The current from a storage battery leaves the positive terminal and returns to the negative.

(2) The storage battery being used for lighting purposes when the engine is not running, it leaves the battery from the positive following the frame, thence through the ground of the various lights, thence the switch at contacts 1, 2 and 3, thence the circuit breaker, thence to negative of battery.

(3) When using the starter the current flows from positive to frame, thence to ground of motor, thence through brush and commutator of motor, thence to negative.



(4) When the engine is started and running under 300 revolutions the current flows from positive to frame, thence through engine case to timer, thence to ignition coil, thence to switch at contact points 5, 9, 4, thence through circuit breaker, thence to negative.

(5) When engine is speeded up above 300 revolutions, the generator comes into play and is used for the ignition and for charging the battery. The current flows (for ignition) from the generator terminal No. 2 to automatic cut-out contact No. 1, coming out through terminal No. 2; thence through circuit breaker, thence through switch on dash at contacts 4, 9, 5; thence through ignition coil, thence through timer, thence to ground, and thence to generator ground and back to generator commutator.

(6) While the above is going on the excess current, when voltage is above 6½, flows from generator terminal No. 2 through shunt, thence to generator terminal No. 1, thence through voltage regulator terminal No. 3, thence through automatic cut-out No. 1, thence to ground, thence to positive of storage, thereby charging same, thence out through negative, thence to terminal No. 3 of generator.

(7) When running the car at night the storage battery furnishes the current for the lamps, thence is flowing from the positive of the storage battery to the frame, etc., but at the same time with the engine going over 300 revolutions the generator is furnishing current from the ignition as above outlined (5), and is also charging the storage as above outlined (6), and is also charging the storage battery as mentioned in (6). Hence, under these conditions, there is a current flowing from the storage battery positive to ground, and a counter current flowing from generator to ground, thence to positive of storage battery. I have never seen the inside of the switch on the dash and am curious to know the mode of making the various closing contacts. Would appreciate a wiring plan of same.

Reply.—Questions 1, 2, 3 and 4 of this system, the Delco, are answered properly. The answers 5, 6 and 7, show you have a good idea of the functions of the parts mentioned, but you have the current going in the opposite direction to the different circuits. The positive generator is connected or grounded to the frame of the car and from this

Wiring Diagram of Delco System Utilized on the 1914 Model Cadillac and Showing the Paths of the Current.

connection, or ground, the current is distributed through the different closed circuits. When the car is run with the lights turned off, the current will travel through the frame of the car to the ground connection of the storage battery, to the ground connection of the ignition and the ground connection of the shunt field and through these circuits back to terminal No. 2 of the motor generator or top of the generator frame. The circuits are shown in the accompanying drawing, the heavy arrows indicating the charging circuit, the light arrows the ignition circuit and the dotted arrows the shunt field circuit. Should the lamps be turned on the circuit through the different lamps will be as shown by the dotted lines. It is assumed that the circuits shown are with the generator generating in excess of the amount of current used in the different circuits. However, should the load be greater than the amount of current generated, the additional current would be supplied from the storage battery. The makers of the system will not supply other than the diagram shown herewith and wiring diagram.

2242 Weights, Gear Ratios, Etc.

From Walter Carrico, Idaho.—I would like to know the weight of the 1916 model Studebaker, four and six-cylinder, also the gear reduction on the low

Digitized by Google

and intermediate speed, also at what number of revolutions per minute does the engine produce its maximum power. Please describe in a general way what important changes have been made in the engines since 1915. I expect to buy a six-cylinder Studebaker.

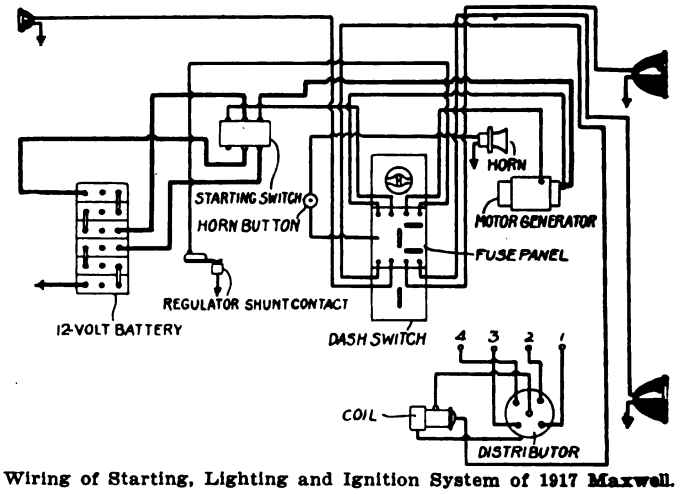
Reply.—The weight of the 1916 model, four-cylinder Studebaker is, according to the maker, 2,770 pounds. That of the six-cylinder car is 2,970 pounds. The transmission gear ratio for the both models when operating on the low speed is 3.64 to 1, and 2 to 1 on the second or intermediate speed. The maximum horsepower of the four-cylinder engine is developed at 1,800 r. p. m.. at which speed the four-cylinder unit develops 40 horsepower and the six-cylinder from 50 to 55. The changes made in the engines between 1915 and 1916 are an increase in bore from 3½ inches to 3⅞, the use of a crankshaft of larger diameter and various refinements.

2243 Would Change Wheels.

Dr. H. W. Saylor, Nebraska.—Please inform me whether or not I could put 30 x 3-inch wheels and tires on my Ford roadster. Would I get more power and possibly less speed? Would it make much difference in tire cost, enough to pay for the change? Would like the proposition discussed.

Reply.—The size wheels and tires can be used. J. F. Shaffmaster answers this question insofar as practicability is concerned. He obtained the desired sizes by trading wheels with another Ford owner; that is, he swapped his rear wheels for the front wheels, thus obtaining the size desired. The change is made by removing the wheels without the hubs from the front of one car and the rear of another. The 30 x 3 are placed on one machine and the 30 x 3½ on the other.

2244 Has Oiling Trouble.



From Charles C. Davis, West Virginia.—1—I have a 490 Chevrolet and am having trouble with the spark plugs. These carbonize and foul with oil. They will not spark without cleaning. Would you advise the use of some form of non-leak rings? 2—Is Johnson's carbon remover good for an engine? 3—Can I have a hand lever emergency brake installed on the car? 4—If I use four-inch tires on the rear wheels will it kill the power? 5—Could the pump or oiling system throw too much oil? The garage man said he could groove and bore holes in the pistons and that it would stop the plugs from fouling.

Reply.—Yes, providing they are properly installed and the cylinder walls are in good condition. 2—Yes. 3—The brake can be installed on all models except the 490. The cost is between $30 and $50, according to the concern doing the work. Every repairman cannot do this work, as it requires a special bracket, etc. The factory service station is best equipped to do this work. 4—Larger tires means increasing the diameter of the driving wheels, and a larger wheel takes more power to revolve it. Oversize tires will slightly decrease the hill-climbing ability of the car. 5—No. The lubrication system is a combined splash and pump. The pump maintains the supply in the troughs into which the connecting rods dip. Decreasing the stroke of the pump will not obtain the result you desire. Your trouble can be remedied or cured by having the repairman cut a groove or drill a hole in the trough so that the height or level of the oil is reduced. About ⅛-inch reduction is generally employed.

2245 Work for the Manufacturer.

From Dewey S. Krohn, Montana.—What can be done with the trip register on a Stewart Speedometer, magnetic type? The trip will show six or eight times as much mileage as the season mileage shows, which is correct. I have been advised to take it up with the manufacturers, but thought it would be too much trouble for a little thing like that. How can the case be taken apart? What care should a Simms-Huff motor generator have? How is the Maxwell 1917 touring car wired?

Reply.—We would advise that you either send the speedometer to the manufacturer or to one of his service stations. The correcting of the trouble mentioned is best left to those familiar with the instrument. Complete instructions for the care of the lighting and starting system mentioned can be obtained from the maker, the Simms Magneto Co., East Orange, N. J., the Maxwell Motor Co., Inc., or the agent of the car. To publish the instructions would require considerable space. The wiring diagram is reproduced herewith.

Wiring of Starting, Lighting and Ignition System of 1917 Maxwell.

2246 Would Increase Compression.

From Amos Barr, Washington.—1—What method should be used to build up on pistons of a Reo 4 motor to increased compression? 2—How much would it be safe to increase compression without causing preignition? 3.—A motor with built up pistons and Never Leak rings will have what advantage in power, speed, flexibility and economy over same type of motor which has had the same service and has not been worked over? The motor in question is a Reo 4, 1914 model, with a 4-inch bore and low compression. I am somewhat of a mechanic, but have never tackled a job of just this kind before.

Reply.—Your questions have largely to do with engineering and designing. Theoretically, an increase in compression pressure will obtain an increase in efficiency, but this is practically true only up to a certain point. The amount of compression that can be used is limited. It is held that it is not practical to construct engines that will operate properly under very high pressures rapidly imposed by explosion. Another objection is that the rise

Digitized by Google

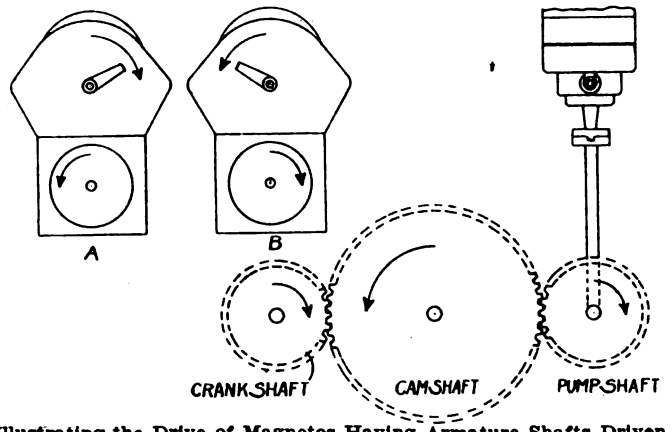
in temperature of the mixture resulting from compression may be easily sufficient to explode the mixture before the piston has completed its stroke. This pre-ignition is possible even with low compression if any part of the clearance is not water-jacketed. Lucke states that the compression pressures of from 45 to 95 pounds per square inch are safe as regards the danger of pre-ignition. We would suggest that you take up the matter of changing over your engine with the maker of the car before attempting the innovation suggested. Insofar as the advantages of your proposed alterations are concerned, it is difficult to predict what results you would obtain, because there are several other factors which would have to be considered in increasing your compression. To discuss the subject as it should be would take up considerable space and, as we have previously stated, the information desired is strictly technical and should be obtained from the engineer of the factory making the car.

2247 **A Fuel Saver.**

From William Roberts, New Hampshire.—I have an Overland 83B touring car, and would like to know if the contrivance for letting in more air that is put on the intake manifold is any advantage. One man I know says it saves gas and gives more power. Also would the Wilmo Manifold be an advantage on my car?

Reply.—The use of air drawn in by the suction stroke of the piston and mixed with the mixture is held to obtain greater efficiency from the mixture. The Wilmo manifold has, according to tests made under the auspices of the Automobile Association of America, greatly increased the mileage obtained with a gallon of fuel. This efficiency is due to the heating of the mixture by means of the exhaust gases, thereby obtaining a homogeneous mixture, etc.

2248 **Has Obtained Good Service.**



From F. G. Nickerson, Massachusetts.—Would you advise me to do any overhauling and tightening up of the engine of a car that has been driven 11,000 miles, is still running perfectly and has never been adjusted or repaired? Although I have good power, would it not be to my advantage to put in new piston rings for the coming season if I intend to keep the car? On account of these satisfactory conditions and no knocks of any kind, I am inclined to think it is a good idea to let the engine alone.

Reply.—If your car is giving satisfaction, has not lost power, etc., it is not advisable to tamper with it. If, as you say, the engine has been operated over 11,000 miles it might be a good plan to have the carbon removed, the valves reground and the timing checked up. If you are to use the car another season it would not do any harm to go over it and make such adjustments as are required to compensate for wear, renew the supply of lubricants, etc.

2249 **Concerning Magnetos.**

From T. F. King, Tennessee.—We have in our garage an old style Buick and it has a high-tension magneto, a Bosch DU4. This magneto will give a good spark when rotated to the right, but will not spark when rotated left-hand. Now, before I took this magneto off it gave a good spark, and this has got my goat as well as two other mechanics. The engine drives the magneto shaft opposite to that of the crankshaft. If you can help me on this problem I will certainly appreciate it.

Reply.—The Bosch DU4 magneto should have a mark, an arrow, indicating the direction it should be driven at or near the tapered part of the driving shaft. All of these magnetos are designed to run in one direction only; that is, either clockwise (right) or anti-clockwise (left). The direction is determined by viewing the magneto from the driving or shaft end. If the instrument does not give a spark when the armature is rotated to the left, but does when turned to the right, indicates that the magneto is to be driven clockwise. This can be checked by the arrow or mark above referred to. Unless we are mistaken, the car referred to

Illustrating the Drive of Magnetos Having Armature Shafts Driven Clockwise and Anti-Clockwise.

takes the drive for the magneto through the pump shaft. If such be the case and the valves are in the same side as the magneto, you would have a condition obtaining as indicated in the accompanying drawing which shows the crankshaft, camshaft and pumpshaft gears. As may be noted, the crankshaft rotates clockwise. The camshaft turns in the opposite direction, but the pumpshaft rotates in the same direction as does the crankshaft, which is clockwise. The feature confusing to many in installing magnetos is the failure to realize that a magneto driving clockwise will appear to be driven anti-clockwise when viewed from the distributor and breaker box end. The drawing at A shows the distributor and breaker box end. The breaker mechanism, which is secured to and revolves with the armature shaft is, in this case, shown by the arrow to be rotating anti-clockwise. But the armature shaft is being driven clockwise when viewed from the driving end. The sketch at B illustrates a magneto driven anti-clockwise, and the arrow on the breaker box shows that the breaker mechanism is turning to the right. In both cases the distributor rotates in an opposite direction; that is, opposite to the direction of the driving shaft when viewed from the distributor end. As previously pointed out, the Bosch instrument is made to be driven in one direction only.

2250 **Where to Locate Ring.**

From John E. Wood, New York.—In order to prevent excessive consumption of lubricating in my model 4H Lexington, I am considering replacing one

Digitized by Google

piston ring in each cylinder with a Gill ring. Will you kindly let me know whether I should place the new ring on the top or the bottom of the piston to obtain the best results? A letter from one of your readers fully explained the results of some experiments along this line several months ago, but I am unable to locate the back number containing it.

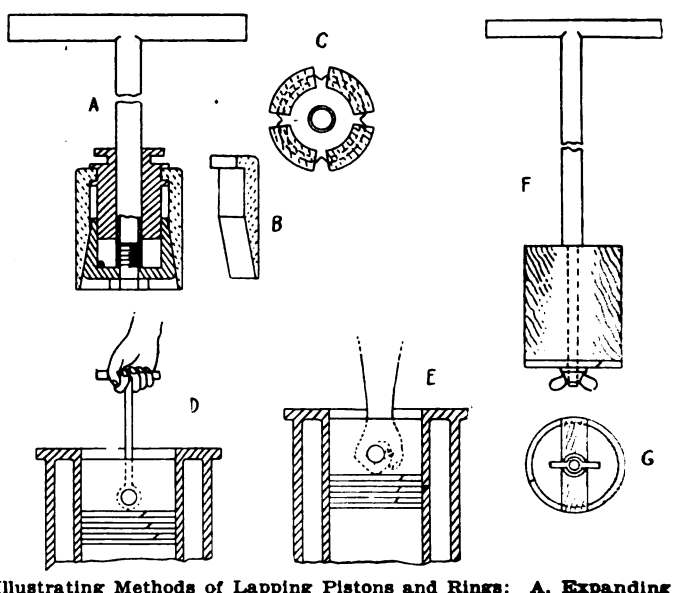
Reply.—The majority of manufacturers of rings of this type advise placing the ring at the bottom of the piston when one only is employed. The article referred to was published in the December (1916) issue, page 52. The contributor of the article states that he found by experience that the use of a single ring at the top of the piston did not prevent the oil trouble, that the cylinder continued to flood with lubricant. By placing the ring at the bottom and using another patent ring at the top the oil trouble was cured. Another mechanic found by tests that good results were not obtained by using a single ring and placing it at the bottom of the piston. We would advise that you use at least two new rings, one at the top and the other at the bottom of the piston. It would be even more satisfactory to utilize new rings throughout; that is, a ring for every groove in the piston, three or four as the case may be. As a rule, the use of a single ring only partially solves the problem, and when one has a piston ring out he might as well make a thorough job and use new rings throughout. The extra cost involved is well worth the difference. If this is not done it is advisable to use the rings mentioned at the top and bottom and a new one-piece ring, if desired, in the middle groove. The failure of some motorists to obtain the results desired with patented rings is largely due to trying to make one ring do the work of several.

2251 **Kerosene to Prevent Freezing.**

From Henry Albert, Michigan.—I read your magazine with a great deal of interest and believe the Automobile Dealer and Repairer the best publication for both owner and repairman. I have as yet never had any occasion to consult your Trouble Department as I seem to get a lot of information from the answers you publish for the other fellow. I am driving a Hupmobile, model N touring car, on which there is used a thermo-syphon cooling system. Having had considerable trouble last winter with freezing, I would like to know whether it would be practical in your opinion to drain the water from the radiator and use kerosene instead. I have often heard of kerosene being used successfully, but have always doubted the wisdom of it. I might say that I have used large quantities of alcohol, but it does not seem to make a satisfactory mixture, which I presume is due to the absence of a water pump. I also use a radiator cover. I drive the car all winter and keep it in a cold garage. Kerosene would seem to make an ideal anti-freeze if, indeed, it would not cause any trouble.

Reply.—Kerosene and other oils have been utilized in the cooling system of a motor vehicle, but we do not recommend its use, particularly with the passenger vehicle. Kerosene will affect the rubber tubing, gives off a disagreeable odor and readily soils clothing, etc. If you experience trouble with the alcohol solution, why not try some of the prepared solutions? Several of these have a very high boiling point, do not affect the tubing or evaporate when heated. The subject of anti-freezing solutions was thoroughly discussed in the October number.

2252 **Desires Operating Costs.**



W. E. Baker, Minnesota.—Kindly advise what it costs to run the average 2,500-pound car per mile, including depreciation and interest on investment. What would you consider a fair average charge per mile for livery work? How much per hour?

Reply.—It is not practical to supply cost figures for a 2,500-pound car, for the simple reason one machine may cost considerably more to operate than another of similar capacity; that is, the cost of operation and maintenance may be more or less. Cars vary considerably. Some vehicles will obtain a certain number of miles to a gallon of fuel, while another make of the same weight will average considerably less. Similarly, one car may be harder on tires than another of similar weight, horsepower, capacity, etc. We would suggest that if you have a certain make or makes in consideration, that you investigate the operating costs of these. The agent or manufacturer will supply you with figures which can be checked up. There is no fixed charge for mileage other than in cities or towns having laws to regulate these charges. Prices in sections not regulated by law vary considerably, as does the price per hour. The price to charge can best be determined by local conditions, competition, etc.

2253 **Lapping Pistons and Rings.**

From Charles J. Sparrenberger, New York.—I would like complete information for lapping in pistons and rings. Are they lapped together or is each ring lapped separately and the piston by itself?

Reply.—The method to employ depends on the condition of the cylinder surfaces, rings, pistons, etc. If the cylinder surfaces are in good condition

Illustrating Methods of Lapping Pistons and Rings: A, Expanding Type of Piston; B and C, Lead Quadrant and Sectional View; D, Using Connecting Rod with Piston; E, Using Wristpin for Handle; F and G, Wooden Plug for Retaining Ring.

only the rings need be lapped, the lapping being done to obtain a snug fit with the cylinder walls or surfaces. The process consists of moving the rings up and down in the cylinder and using an abrasive of ground glass and oil or oil and the finest

Digitized by Google

of carborundum. When the rings bear all around, the work is completed. To simplify the work, make a plug of yellow pine to fit easily the cylinder and square one end as shown at G. Place the ring on this end and retain it by a batten as shown in the drawing and use a screw to secure the batten. Smear the cylinder walls with the abrasive and operate as previously explained. Lapping should not be continued for a long period on one side. Turn the ring occasionally. After lapping, clean ring with gasoline and fit to the piston groove if a new piston is to be used or even an old one. If the cylinders are scored and are to be lapped, the work is done with an old piston and not the new one. Using the new piston would mean that too much would be likely to be worn away in the process. There are several devices used for lapping. Two of these are shown at D and E, and consist of using the wristpin as a handle, while the sketch E shows how the work is done by hand. An old piston can be used or an expanding design made as shown at A. When the walls of the cylinder are badly scored it is best to use the expanding type of piston. This information relates to the cast iron pistons and not aluminum. The former should be about .001-inch smaller than the bore for each inch of piston diameter, at the top. If aluminum pistons are used the clearance, average, is about .002-inch per inch piston diameter. There is little, if any, lapping required with the patented type of rings unless the cylinder walls be badly scored or out of true.

2254 Dealing With Welding.

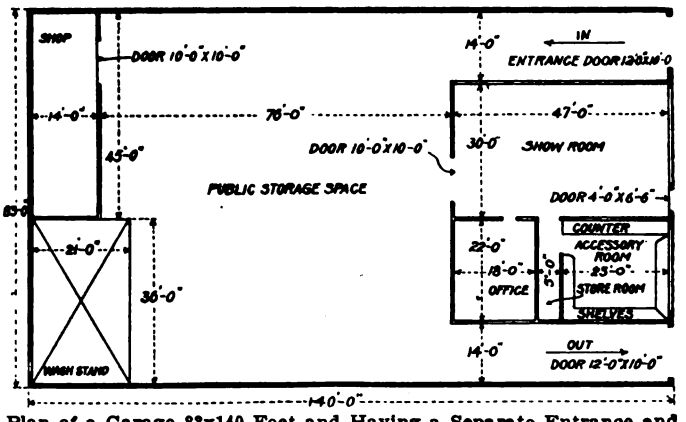
From C. R. Thompson, Colorado.—I have a Metz 22 runabout, model 1914. The bearings of the countershaft holding the friction wheel at each end are badly worn and will have to be replaced. Lubrication is by cup grease. The friction wheel has one spoke cracked, also the cavity holding the lock key, a part of the wheel proper. Can the material be welded and will it hold? Do you consider lubrication of these parts by cup grease is sufficient? Can oil be used to an advantage in the grease cups, or would you recommend a different or thinner quality of grease?

Reply.—Welding by the oxy-acetylene process should make the part as strong if not stronger than before the break. Lubrication by the grease cup method is satisfactory, provided the supply is replenished and used according to the instructions of the maker of the car. It is doubtful if you could use an oil in the cups with any degree of success. As to the proper grease to use, would suggest that that recommended by the manufacturer of the car be used.

2255 Gearset Is Noisy.

From L. F. Hardesley, West Virginia.—I have a 1915, model 34 Allen car. It has a grinding noise in the first and second speed. There is no noise when in high. I have installed a new countershaft, main shaft, intermediate gear, bearings, shifting rods and forks, but the noise continues. Can you advise me as to what is the trouble?

Reply.—The fact that the noise is absent when operating in the high or direct speed indicates that the gears of the countershaft and main shaft are not aligned or do not mesh properly. Remove all of the lubricant from the gearcase, clean the gears, and jack up a rear wheel. Start engine, engage the first or the second speed, and let in the clutch. This will enable you to locate the gear or gears at fault by the noise. Examine the mesh of the new second speed gear and the gear with which it meshes on the countershaft. If the last named gear be badly worn its teeth may not mesh smoothly with those of the new gear.



2256 Is Wasting Fuel.

From R. C. Miller, Florida.—Will you kindly help me out of my troubles as you have helped others? I have a model 42 Overland with Bosch magneto and model L Schebler carburetor. Do not use any batteries. The engine starts easy and runs well, but when I close the throttle and throw off the switch the engine rocks two or three times before it stops. As the engine stops it blows back through the carburetor, blowing gasoline clear out of the carburetor and causing a waste of the fuel, about ¼ pint. I had the car repaired by a good mechanic and installed a new carburetor of the same type, but the results are the same. Can you tell me the cause and the remedy?

Reply.—The blowing back through the carburetor is caused by the air displaced by a piston moving upward on the compression stroke, at which time the intake valves should be firmly seated. If the valves do not seat properly or are out of time, there is an opportunity for the compression escaping past the valves and out through the intake manifold and carburetor to the outer air. If the height of the fuel in the float chamber be unduly high an excess amount of gasoline will be swept out by the air.

2257 Desires Garage Plan.

From W. U. Mussina, Pennsylvania.—What information can you give me on the construction of a garage 83 x 140 feet in the center of a block, with

Plan of a Garage 83x140 Feet and Having a Separate Entrance and Exit.

no rear exit to house a showroom, accessory room, shop and public storage? Any points you can give me will be appreciated.

Reply.—The accompanying illustration shows a plan providing a separate entrance and exit and with dimensions.

2258 Fitting a Shaft Pinion.

From Clarence Grosse, Minnesota.—I am having considerable trouble with the differential of a 1915 Maxwell. The trouble appears to be caused by the

Digitized by Google

drive shaft pinion working loose on the shaft and a piece the length and depth of the keyhole breaks away and cracks the sleeve, creating more trouble. This has happened six times during the summer. I have used new parts every time and those supplied by the company. How can I adjust this trouble? Can I get and use a heavier shaft to fit this car?

Reply.—The pinion of this car fits on a taper shaft and a Woodruff type of key is used to retain it. In replacing an old pinion with a new one care must be taken to fit it properly. Many times it will be found necessary to use a little fine emery and oil on the shaft and pinion to obtain the fit; that is, grind the parts to enable moving the pinion up on the shaft where it belongs. The key must fit properly. If too high the pinion will ride on it and, carrying all the load, the break will occur as stated. If the key be too loose, the pinion will move on the shaft. The fitting of a pinion requires experience, and if you are not familiar with the work we would suggest that you have it done by either the service station of the company or by an expert familiar with the Maxwell construction.

2259 **Anti-Freezing Solutions.**

B. J. Dodge & Company, Wisconsin.—I have a Dodge touring car, 1915 model. A doctor near here who drives a lot uses kerosene oil in his radiator in cold weather to prevent freezing. Kindly advise merits and demerits of using kerosene oil. Would also ask what can be used successfully to pack smaller cylinder of hand air tire pump—the cap or stuffing screw. Have used candle wicking, but does not seem to hold. Pump is O. K. but for this air hole. Kindly advise practicability of inner liners to old tire casings.

Reply.—The subject of the use of kerosene in the cooling system is discussed in the reply to a similar question in this department. Leather is used for a packing in many pumps. One can be made, using the old member for a pattern, or one secured from any automobile supply house. Duplicate packings can be obtained from the maker of the pump if the supply house does not carry them in stock. Inner liners when properly fitted should make possible obtaining considerable mileage from a worn shoe. The mileage, of course, will depend upon the condition of the casing.

2260 **Would Use Trailer.**

From J. Chauncey, Pennsylvania.—We have a 1916 6-46 seven-passenger touring car. Would it be possible to attach a trailer of any kind to this car? In your judgment, what would be a proper load for the trailer to haul when the car has seven passengers in it; that is, on level macadam and at a speed of 15 or 20 miles per hour? For example, would it be advisable to put seven passengers in the car and then put eight or ten 14-year-old boys in a trailer and take the whole crowd on a ride of 10 or 20 miles on good macadam? I have been a subscriber of your excellent magazine for several years, and I find it interesting and instructive.

Reply.—Trailers are used and hauled by passenger cars and with varying loads. We have no data as to tests or experiments conducted with cars hauling trailers of various capacities and cannot give you other than a general reply to your question. The weight of the trailer loaded with ten boys would have to be taken into consideration, also the effect of starting on the car. If the load be hauled on a good, level road and care exercised in starting the machine, no serious results should be anticipated. With the car loaded to capacity; that is, with seven passengers, it is obvious that any overload will impose stresses upon the mechanism. Care must be taken in attaching the trailer to the car, to avoid the possibility of undesirable strains being imposed on the rear axle, etc.

2261 **Another Piston Question.**

From H. H. High, Kansas.—I have a Ford and wish to fit oversize pistons and prefer not to have the block rebored. I understand that rebored cylinders are not always the same size and a good fit. I have seen mechanics here in the local garages lapping in oversize pistons in new blocks, and they tell me that they sometimes find it necessary to put different size pistons in the same block. The custom here is to cover the oversize piston with valve grinding compound and then push it up and down and around in the cylinder until it would go completely through. I do not like this method, as it seems to me that the grinding compound would wear the piston out of round at the same time it was wearing the cylinder to fit. Could I use a cylinder lap, a lead plug, or an old piston and obtain the desired fit?

Reply.—The subject of lapping in pistons and rings is discussed in the answer to Charles J. Sparranger.

2262 **Estimating Horsepower.**

From W. H. Salzman, Colorado.—Will you please explain how many horsepower can be driven from a 32-volt, 15-ampere generator? I know this is out of the automobile line, but I trust to receive a reply in your next issue.

Reply.—The actual horsepower you would obtain with the generator depends upon its efficiency. This will vary according to the type of unit. The output of the generator is, according to the usual method of figuring, 480 watts. This is obtained by multiplying the volts and amperes, 32 times 15 equals 480. Inasmuch as 746 watts equals a horsepower, the output of the generator will be .64 horsepower, which is obtained by dividing the watts of the generator by 760. With these small units it is doubtful if you would secure much over 50 per cent. efficiency when driving a motor.

2263 **Hard to Start If Warm.**

From J. M. Bigham, North Carolina.—My 1917 Ford is not hard to start when cool, but is very difficult to crank when hot or immediately after a long run. Why?

Reply.—Assuming that the spark is as it should be and the mixture is correct, the failure to start may be ascribed to either the cylinder being flooded, and which could be caused by throwing off the switch and opening the throttle wide and with a rich mixture, or the gaps of the plugs becoming fouled with soot or oil. Try shutting off the throttle and screwing down the needle valve until it closes, after which spin the crankshaft to pump out the cylinders. An examination of the plugs after a run would indicate if the gaps be fouled.

Digitized by Google

2264 **Would Use Graphite.**

From O. W. Chamberlin, South Dakota. — I am considering installing a graphite lubricator on my auto and tractor, but have been advised that graphite will heat the engine. Is this true?

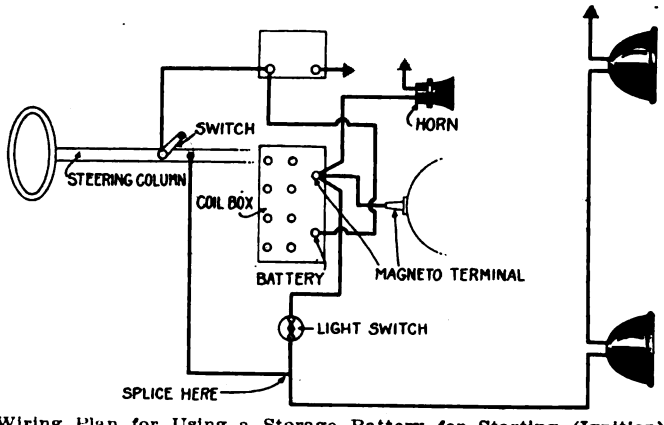
Reply.—The proper use of graphite will not injure the parts to be lubricated, nor will it cause heating. Graphite fills the pores of the frictional surfaces and decreases the friction. The Joseph Dixon Crucible Co., Jersey City, N. J., issue an interesting brochure on this subject, and it explains the proper grade of graphite to use for different purposes.

2265 **Is Using Too Much Gas.**

From W. J. Easthurn, New Jersey.—I am having trouble with my 1912 Mitchell, which has a Splitdorf magneto and Stromberg carburetor. The engine runs all right at low speed and at high, but when I desire to accelerate from low to a high speed I have to slip the clutch to let the engine pick up. The engine misses and there is an awful black smoke at the exhaust. It acts as if it loads up. I have put in six new valve guides and tried to adjust the carburetor, but without success. This trouble occurs when running slowly and I pick up the engine, and it occurs no matter how easy I feed the gas. I hope you can advise me what to do.

Reply.—The presence of black smoke indicates the use of too much fuel in proportion to air, or, in other words, you have an excessively rich mixture. Either cut down the supply of fuel or increase the amount of air. Examine the float of the carburetor and note if the level of the fuel is correct. Make sure that the supply of fuel to the float chamber is regular and that the flow is not restricted.

2266 **Has Hissing Sound.**



From E. P. Bossard, Canada.—I have a new Dodge car, 1917, which I have run only 750 miles. There is a hissing sound which appears to come from one of the cylinders. The leak seems to be down into the crankcase, and can be heard through the breather pipe. What would cause this, and what is the easiest way to fixe it up?

Reply.—Your trouble is undoubtedly due to leakage past the rings. A simple test for this trouble, which allows the gases to escape into the crankcase, is to crank the engine slowly by hand with the switch off and when the engine is hot. If any leaks exist they will be indicated by a mist-like vapor escaping from the breather. The remedy is to examine the cylinder and locate the exact cause of the trouble. The compression of the cylinder can be tested by using a compression gauge.

2267 **Battery Lighting for Ford.**

From J. R. Fowler, Arizona.—Can I put a small storage battery on my Model T 1916 Ford and use it for lights, also for starting in cold weather? Could I put a switch on the steering column and switch the lights onto the magneto for ordinary speeds and good roads when the magneto light is sufficient?

Reply. — The accompanying diagram shows a method of wiring for making use of the battery current for starting and lighting. One lead from the battery is grounded and the other is led to the coil terminal marked "Battery." For lighting, a wire is carried from the battery to the switch on the steering column, thence to a point between the headlights and regular lighting switch. The splice

Wiring Plan for Using a Storage Battery for Starting (Ignition) and Lighting.

should be soldered and carefully taped, as the system is of the grounded type. It will be essential to use bulbs of the same voltage as the battery.

2268 **Bearing Adjustment.**

From J. M. McKenzie, Nova Scotia.—I wish information as to the best way to take up the wear in the rear bearing or crankshaft of a 1916 Maxwell. I wrote the Maxwell Co. and they said it was a simple matter; just remove the shim, that it could be done through the oil part hole at the bottom of the engine. I tried it and could not get the blearing clamp screws out more than half way. Please advise as to what I will require to take up the bearing and without taking out the crankshaft, etc. I am a long way from a garage and have to make my own repairs.

Reply.—With this model Maxwell you will have to practically take the engine down to get at the bearings mentioned. This means that the engine will have to come out of the frame, the block removed, etc. There is no other way to remedy the bearing trouble. Inasmuch as you will have to disassemble the engine it will afford you an opportunity to give the power plant a thorough overhaul.

2269 **Recharging Ford Magnets.**

From Ernest Anderson, Kansas.—I saw in a copy of your magazine some time ago, directions for recharging a Ford magneto without removing the engine. I have been unable to find it again. Will you please write and let me know how to do it? I have a 32-volt storage battery of 16 cells. Please let me know full particulars.

Reply.—The article referred to was published in the January (1917) issue. Owing to the fact that the instructions occupied over two pages, lack of space prevents their reproduction. A copy of the issue has been mailed you.

Ed. Note.—While it is our policy to supply information to our readers, it is not always possible to reprint lengthy articles owing to the lack of space. Whenever back copies of the article are available, they will be mailed. This does not mean that it will always be possible to supply back copies, and subscribers should not take it for granted that back issues are available.

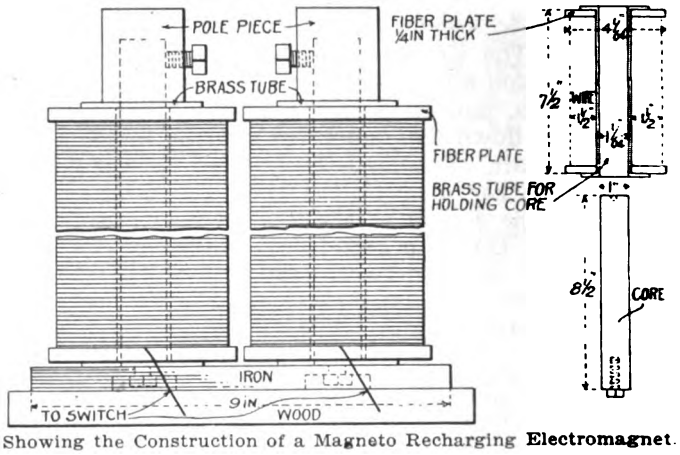
2270 A Case of Compression.



From E. F. Rider, Montana.—I have a 1913 Buick, model 25, and have had trouble with the No. 4 cylinder for three years. After the engine warms up it will run on four cylinders at any speed from six miles to 20 miles an hour on the high on a level road. But when you open up the throttle to make a grade the No. 4 cylinder will miss from six to twelve explosions, then pick up and run all right. The remaining cylinders run perfectly. Have changed the carburetor adjustment, but it makes no improvement. Have removed carbon, overhauled engine, fitted non-leak rings, put in a new switch, spark plugs, but without improvement. Compression is good, as are gaskets. Spark seems to be all right. Clearance between valve stems and tappets the same on all cylinders.

Reply.—If the components of the engine are in a properly working condition and the trouble is confined to one cylinder, and the missing occurs only when you accelerate suddenly, your trouble is probably due to too wide a gap of the spark plug in that cylinder. If the gap be too wide, misfiring will occur when the throttle is opened suddenly, particularly after running slowly. The acceleration admits a large amount of mixture and increases or raises the compression point, the resistance increasing with the pressure. Try a smaller gap with the plug and note results. If this fails to cure the trouble, examine carefully the wire leading from the source of current supply to the spark plug, the high-tension cable. This may leak current, a small leak, perhaps, and one that causes the intensified current to take the path of least resistance. As the compression increases, so does the resistance above referred to. Consequently a greater pressure of current is essential to overcome this resistance and that of the gap of the plug.

2271 Nearly One Dozen Questions.

From F. G. Elfring, Illinois.—I have a model 24 Oakland Roadster. 1—Is it practical to connect the auxiliary air intake to the exhaust on a model L Schebler? 2—Would it mean greater efficiency? 3—This roadster has exceptional getaway, which some of the latest cars haven't got. Is this due to the carburetor, same being oversize? I think it is a 1⅜-inch. 4—Could I put on a smaller size carburetor and still secure the same results? 5—Is it possible to put cork inserts in any type of multiple disc clutch? 6—Will a magneto lose its magnetism through age, although never used? 7—How can I remagnetize a low-tension magneto? 8—Can a two-wire and a grounded system be used on an auto at the same time? 9—I have a round Splitdorf coil, the terminals are marked D D 3. Could I connect this coil to a model D Remy Mag.? 10—How often should piston rings be replaced in an engine that has had perfect care? 11—Would underslinging of full eliptic springs tend to make riding qualities easier?

Reply.—1—Utilizing the heat of the exhaust would be beneficial, as the fuel will be more thoroughly vaporized and the mixture made more homogeneous. 2—Yes. 3—Probably. 4—It is doubtful. 5—Cork inserts would not be practical with every type of disc clutch. The clutch would have to be designed for their use. 6—No. Unless the magnets be removed or injured their magnetism will not be affected by age when not in service. 7—An accompanying illustration shows the construction of a magneto recharging electromagnet. If not made correctly the results will be very unsatisfactory. It is for service with a 110-volt direct current lighting circuit. If an alternating current be employed a rectifier must be used between the circuit and the coils. Inasmuch as the dimensions of the components are given, these will not require discussion. The core is of soft iron and two are used. Both are drilled at the bottom for a retaining screw which is employed to keep them in firm contact with the base plate, which is of steel 4½ x 9 inches. Two blocks of steel 1¾ x 2 x 4 inches are drilled to take the cores, and set screws are used in the side to permit of clamping them tightly against the core to form pole pieces. The brass tube should be about 1/16-inch thick at the side, and has flanges at each end, these projecting over to retain insulating plates. The hole through the center of the brass member should be such as to permit the core to fit freely. Twenty-two pounds of No. 20 B. & S. gauge insulated copper wire is needed, 11 pounds being wound around each brass tube, winding one coil in one direction

Showing the Construction of a Magneto Recharging **Electromagnet**.

and the other in the opposite way. Five or six inches should be allowed for connections before starting the winding. After winding the coils, shellac them thoroughly and wind with tape. Attach the cores to the base plate, slip the coils over the cores and attach the pole pieces, using the set screws as previously mentioned. In charging, the magnet is placed on the top of the pole pieces, the north pole of the magnet to be charged being placed on the south pole of the core of the electromagnet and the south pole of the magnet on the core of the north pole of the electromagnet. The polarity can be determined by making use of the fact that poles alike repel each other and unlike attract each other. The period for closing the switch of the circuit is about five seconds, and three periods are required. The time required to charge the magnets varies from 30 to 60 seconds. Vibration should be set up in each magnet during the charging period, and this is secured by tapping each magnet lightly on each side near the top. Two hammers of not over six ounces each are used. After completing the final period remove the magnet and place a bar or keeper across the open end. 8—A one and two-wire system cannot be used for the one lighting and starting system. 9—Would not advise connecting the coil

Digitized by Google

of one make of a magneto with another type of magneto, for the reason the winding is very likely to be different; that is, the Splitdorf coil is wound particularly for the Splitdorf magneto. We do not say that such a connection cannot be made, but advise taking the matter up with the maker of the Remy magneto. 10—This would depend on the condition of the cylinders, piston and old rings. Rings should be replaced when needed, and this is determined by conditions. 11—Locating the spring as mentioned would obtain a lower center of gravity. It is doubtful if it would.

2272 **Installing Spotlight.**

From W. T. Widup, Indiana. — Through your valued publication I found a searchlight to suit me, the Howe. I should like you to tell me the most practical way of wiring same to the electrical system of a Haynes 34, light six, 1916. I do all of my adjusting and repairing, but am not quite up on the wiring.

Reply.—To connect a spotlight in the lighting system of the Haynes model 34 observe the following directions. An indicating circuit breaker is used on this model, the indicating target being plainly mounted on the cowl board. The lighting switch is also inserted in the face of the indicating breaker. By removing the four screws which hold this face to the cowl, the circuit breaker and light switch may be easily removed. The two wires leading from the spotlight should be connected to the two lower connections of the circuit breaker. These are marked by the letter B, which stands for battery, and also are marked with the polarity symbols of the battery. A sketch is not provided because the information contained herein should be ample for the work.

2273 **Another Case of Smoking.**

From William Brown, Paterson, New Jersey.—I have a 1914 Baby Grand Chevrolet. How can the oiling system be regulated so it won't fill the dippers in crankcase too full? It has an oil sight feed, double pipes with a screw cock halfway between the engine and the sight feed glass on the dash. The engine smokes with but one quart of oil in the crankcase.

Reply.—The ends of the rods dip into the lubricant in troughs. Reduce the height of the oil in the troughs as explained elsewhere in this department.

2274 **Several Electrical Problems.**

From Wakeman's Garage, Indiana.—Please answer the following questions: 1—What about the installation of a Ford magneto that will make the lights flicker? 2—What would be the result of placing the magneto coil assembly a few thousandths closer on one side than on the other? 3—What would be the result of not placing the magneto pole ends in a perfect circle? 4—Would any of the above cause hard starting? 5—What would be the result of a weak commutator spring?

Reply.—1—Flickering of the headlights usually is taken as an indication of loose connections in the lighting circuit. In such case the wiring should be gone over very carefully and the connections and lamp sockets inspected, also the connections to the switch. 2—The distance between the magnet clamps and the magneto coil spools should be 1/32-inch for mechanical reasons. If the gap were to be increased so that the distance between the magnets and the coil spools would be over 1/32 inch, then the result would be a decrease in the total current output and a loss in efficiency. 3—The third question is not entirely clear to us. If you refer to the result of placing the coil assembly so that it would not be concentric with the magnets on the flywheel, it would be impossible to get them far enough away to impair the efficiency of the magneto inasmuch as the contact area is more than sufficient to allow for the ⅛-inch difference. 5—None of the conditions raised in your question would cause difficult starting. 6—The weak commutator spring would cause missing of the engine, particularly at high speeds. The trouble would be aggravated if the contact blocks and fibre ring are worn and irregular.

2275 **Coal Oil in Radiator.**

From J. R. Cooper, Kansas.—Is it advisable to use coal oil in the cooling system of an Overland car for winter use? What is the danger of fire? Is it advisable to thin the lubricating oil for the crankcase?

Reply.—Relative to the use of kerosene in the cooling system, we do not advise its use. There is no danger of fire if used properly. Relative to thinning the cylinder oil with kerosene, would advise that you use a lubricant recommended by the car maker for winter service. Practically every oil refiner issues information dealing with the proper grade of oil to use during the winter.

2276 **Would Remove the Battery.**

From Subscriber, New Hampshire.—I would like to have you advise me if it is practical to remove the battery from my 1912 Cadillac and run the car without it. The starting and lighting system is a Delco.

Reply.—The car can be operated without the battery provided you take steps to prevent generation of the current by the dynamo. Either disconnect the drive of the generator or motor-generator, or remove the unit. The maker of the system does not recommend running the car with the battery disconnected or removed, as serious damage to the system may result.

2277 **Theory of the Spark.**

From George W. Smith, Connecticut.—I have been told that a retarded spark helps the engine in hill climbing, but I cannot grasp the theory of it. I should think it would be just the other way. It is the process inside of the cylinder that puzzles me in this regard. I own and drive a seven-passenger Cole 8, 1915 model. I am rather inexperienced in driving. The car negotiates hills easily and rarely ever requires a shift from high to second. When climbing a stiff hill on the high gear and the car begins to slow down a little (the fullest flow of gasoline being applied) and I do not feel the necessity of shifting gears; does the retarding of the spark assist the engine? If so, please explain why. And how far is it safe to throw back the spark lever? In ordinary driving, uphill and down, I carry the spark lever advanced fully four-fifths along the

Digitized by Google

quadrant. Should the retardation of the spark be gradual in such case? Or is there any mechanical error in correct driving in throwing it back suddenly? My spark lever is never at zero. Is advanced one-third even in starting.

Reply.—The function of the spark lever on a motor car is to afford the operator manual control of the time of the spark; that is, to advance or retard the time of the spark in order to compensate for the various engine and piston speeds. The device regulating or timing the spark is so set that with the spark lever fully retarded the spark will occur in the combustion chamber of the cylinder when the piston has completed the compression stroke and is at the top of the cylinder. The setting is not always exactly dead center. It may be slightly before or slightly after, it depending on the timing. Theoretically, the spark is supposed to occur when the charge is fully compressed and the piston approximately at top dead center, but in practice it occurs earlier through advancing of the spark lever, and this advance, as it is called, is necessary to permit the flame created by the spark to spread through the compressed mixture. In other words, an allowance is made for expansion of the gases. Assuming that it requires 1/240 of a second for the flame to spread through the mixture, etc., and the piston is traveling at 1,500 feet the minute. At this rate the piston would have completed a part of its stroke (downward or firing) before the gases expanded sufficiently to exert a pressure on the piston. Consequently, if the spark is not advanced or started earlier, there would be a loss in energy. At slow engine speeds the advance is slight, increasing as the speed of the engine increases. So it will be seen that the advance or retard of the spark causes the spark to occur earlier or later. The spark should be advanced according to the speed of the engine, and no definite rule can be given for the amount of advance. The proper amount is best determined by the operator and by the way the engine pulls. When the spark is advanced too much it is usually indicated by a knock. It is best to gradually retard and advance the spark. The slowing down on the grade as mentioned is due to the load imposed on the engine. The retarding of the spark will not increase the speed or power.

Shifts Ford Wheels.

From J. F. Shaffmaster, Michigan.—Note your answer to No. 2213 regarding inquiry as to use of 3-inch tires on rear wheels of Ford. My experience proves to my entire satisfaction that 3-inch tires on Ford rear wheels are O. K., provided they fit the rims. I traded my rear wheels for a neighbor's front wheels nearly two years ago, and find that a good make of 3-inch tire lasts me just as long as 3½-inch tire on the old wheels. They also last much longer when driving in frozen ruts.

An Efficient Fan Belt.

From C. W. Risden, California.—I was especially interested in the article entitled "Automobile Engine Cooling," as I have experienced considerable trouble in making my fan satisfactory. I use a Stevens-Duryea, 1915 model, and although it has fan pulleys of large size (about 5 x 8 inches) using a flat belt 1¼ inches wide and about 30 inches long, I could not make a belt last but for a short time, which was probably due to a certain extent to the amount of throttle I had open when starting the car, and which was made necessary by the condition I found my generator in. However, my belts would either come unstitched or break, even though we tried different kinds of oil, so in desperation I concluded to try something else. I applied four lengths of 5/16-inch round belting, fastening the ends with a link, as is customary with round belting, my theory being that perhaps the broad flat belt retained the heat, also collected more foreign matter than was necessary. It also required sticking and stitching, both of which caused me considerable trouble, and as I ride without a pan, if the belt should break I would lose it, which would mean a loss of about $3.00 and I would be entirely without the use of my fan until I could obtain another belt. Whereas with a round belt the heat is eliminated much better, foreign matter is not collected, and the belt does not stretch on one side more than on the other; the round belting is applied easier and if breaking should occur it would be only a matter of about 35 cents per belt, and you would still have the remaining ones to operate the fan and hold it in position, allowing the missing one to be replaced when convenient. It also has the advantage of allowing you to use different kinds of round belting and to determine the lasting value of each. Last but not least, if the belt should get tangled up in any of the machinery, it would create less damage than one of full width. Although I have not used the round belt as long as a flat belt usually lasts, I am satisfied that they are much superior, and as I am keeping track, should you care to know how they work out, I shall be very glad to advise you. I very much appreciate the very many valuable points I obtain from your journal.

Show Increase in Electric Motors.

According to statistics of the electrical industry there were produced 11,880 electric motors for automobile use in 1914, a total strength of 36,858 horsepower. Inasmuch as the figures for motors for automobile use are not classified, it is not possible to determine how many of these reported were for driving purposes and how many for starting and lighting.

The smaller number compared with the evidently much larger number of cars equipped with electrical motors for starting purposes leads to the conclusion that it is primarily the total of driving motors for electric automobiles. These 11,880 motors were produced by ten establishments, and compare with 2,796, of 12,471 horsepower, of 1909.

High Cost of Leather.

Leather, like every commodity, has advanced in price and is one of the factors responsible for the H. C. of L. An interesting bit of information on the subject of leather is supplied by the maker of fabrikoid, the Du Pont Fabrikoid Co. The little band of leather, the sweatband of the hat, uses up 44,270,833 square feet of material every year or a total of 55,000,000 feet when an allowance for waste is made. These figures are based on the estimate that there were made in this country in 1916 10,624,406 dozens of hats and caps requiring 265,625,000 feet of leather two inches wide and 25 long. This material would make the tops of 20,000,000 pairs of shoes.

Digitized by Google

Praises Trouble Department.

From D. C. Bays, Colorado.—I thought I would give H. W. Slawson and others my experience with fouled spark plugs. The first of August, 1916, I bought a Ford runabout and could not get over 10 miles without cleaning the spark plugs. I took it back to the dealer several times to see what could be done, and he kept wanting me to try it a while longer to see if it would not get over the trouble by usage. He put in center fire spark plugs, which helped some. After the car had been run about 1,000 miles they took the pistons out and filed off the upper edge of the rings, making them round, leaving the lower edges sharp under the theory that the lower edges would scrape the oil back while the upper edges could not scrape it up into the combustion chamber. It has since given good satisfaction. Afterwards I replaced the upper ring on each piston with a leak-proof ring and now I often drive the car 3,000 miles or more without taking out the spark plugs. I am sending the above to you to print if you think it will be of any benefit to the many readers of your magazine. One item alone is often worth the subscription price of your magazine.

Explains Puzzling Knock.

From R. H. Reed, North Dakota.—I believe I can give C. T. Pierce of Virginia, inquirer No. 2227, some light on his Ford trouble. Have had some few cars in my shop with the very same trouble, and invariably have found it in the crankshaft. The shaft is either out of true or it is loose in one of the three bearings, a trouble not easily detected by just the feel of things. By removing the shaft and placing it in a lathe one can soon locate a bent shaft. If such is the case a new shaft will be necessary. But before replacing new shaft remove babbitt from center bearing complete. Now fit up end bearings to just a nice snug fit then rebabbitt center bearing and you have a good job.

NEW TYPE OF CORD TIRE.

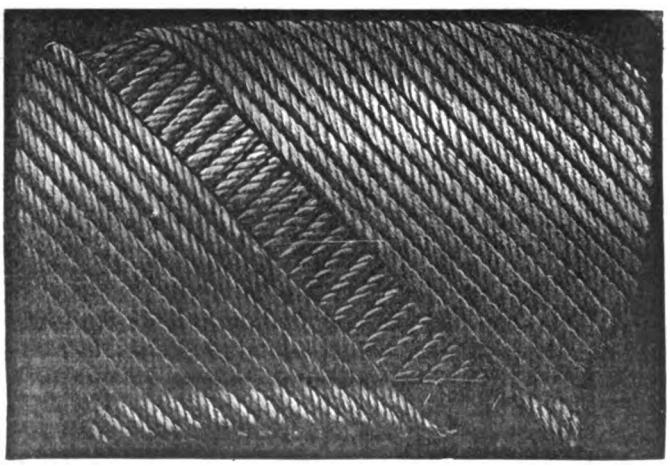
The Carlisle Uses Large Diameter Cords Separated by Mass of Rubber.

A new type of cord pneumatic tire, one presenting many interesting and novel features, has been brought out by the Carlisle Cord Tire Co., New York City. It is the result of the efforts of F. B. Carlisle, and differs radically from other constructions in that the carcass is constructed from single unbroken strands of large diameter cotton cord having a tensile strength of 235 pounds.

One of the several interesting features of the tire is that there are but two plies of cord, and at no point in the construction do these cords touch another. They are separated and surrounded by a thick mass of rubber. This, the maker points out, eliminates almost all internal friction, obtaining a cool tire under the severest kind of service. It is further stated that the construction, which is patented, is so made by the special machines that the cord has perfectly even tension at every point.

Held to Eliminate Friction.

The makers point out that shocks are evenly distributed around the circumference of the tire, that friction between the cords is avoided, and that driving with the shoe deflated will not cause separation of the cord, rubber or tread. One of the advantages emphasized of the Carlisle tire is that it may be retreaded easily and with the ordinary tire



The Carlisle Cord Tire. Note How Each Cord Is Surrounded by Rubber and Separated, a Construction Eliminating Friction.

repair shop equipment; in fact, the company advocates retreading.

The company has erected a large factory at Andover, Mass., and is producing the tire in standard sizes and styles. The Carlisle tire is made in straight side, clincher and quick detachable without variations and accommodates the several styles of rim sections. It is marketed in a non-skid form, termed the Lightning, so-called because the two angular depressions running around the tire closely resemble a streak of forked lightning. It is said to afford the maximum of anti-skid efficiency, combining the grip of the angular rubber channel, the non-side-skid vacuum and the smooth running qualities of the plain tread. Protuberances are noticeable by their absence.

Officials Well Known.

The officers of the company include men well and favorably known in the automobile industry. J. S. Bretz is president; F. B. Carlisle, vice-president; Frank Williams, treasurer, and Frank R. Serles, secretary. Charles A. Gilbert, well known on the Pacific coast and in the tire industry, is general sales manager. The offices of the company are at 250 West 54th street, New York City.

REPAIRING FORD RADIUS RODS.

From James Baldwin, Indiana.—I am supplying sketches showing how I make repairs on the Ford radius rods, the brazed type. These can be determined by the center punch mark on the side near

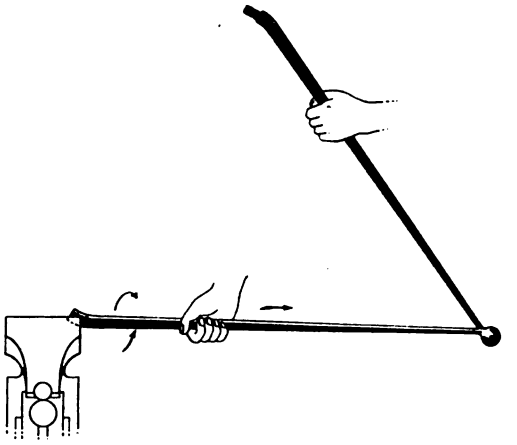

Fig. 1—Illustrating How James Baldwin Disassembles Ford Radius Rod by Heating and the Vise.

the shoulder of the end, and many times the brazing marks can be easily seen. This type of radius rod on the Ford is not provided with a pin to hold the rod or parts together securely, although some imagine that the rods are pinned.

Unbrazing the Work.

It is assumed that the end has been broken and must be repaired. Heat the end hot enough to separate the parts or to unbraze them. This is accomplished by heating the end red hot. Next place the end in the vise as shown at Fig. 1, and by a twisting and pulling movement the parts will separate. Do not suddenly cool the extracted end, as it is steel and you will want to use it again. Of course, if the end cannot be removed it will be necessary to get one from some discarded radius rod. It may be that the part will be so secured that the brazing cannot be started.

Repairing Modern Rods.

Fig. 2 illustrates a method of repairing the Ford radius rod now on the market, the type having the welded ends. Obtain a discarded radius rod of the same make which can be ascertained by the size and in which the punch marks are missing. Saw or cut off 5½ inches from the fork. Measure the

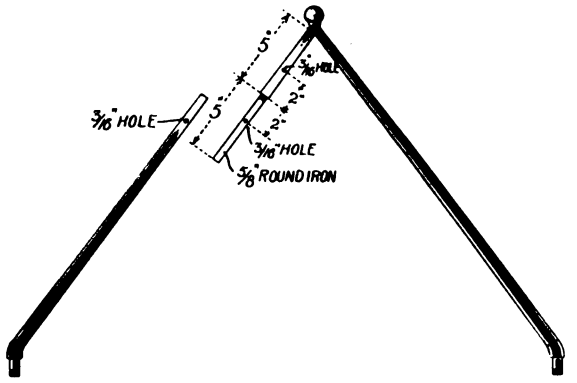

Fig. 2—A Method of Repairing Modern Type of Ford Radius Rod by Using Round Iron, Drilling and Riveting.

end of the extra rod with which the repair is to be made and make sure the ends line up before riveting. Be sure that both ends of the forks are exactly the same length. This is important.

Next take a piece of round iron of the same inside diameter as the tubing and drive it in to a depth of two inches. Drill a 3/16-inch hole and rivet firmly. The other part or free rod is now driven over the round iron, the hole drilled and the parts riveted. This will hold securely and makes a good job.

Make a Shrink Fit.

Fig. 3 shows the method of inserting and driving the parts together, also the dimensions of the rod, holes, etc. Before driving the rod in the tube the latter should be heated red hot and placed in the vise. The heating causes the tube to expand, and when the metal cools the walls of the tube will grip the rod securely. It is suggested the end be beveled slightly; that is, the part fitting the tube. This allows it to clear much better. The holes in tubing should be countersunk.

Automobile Mechanics Wanted.

The government has issued an appeal for volunteers for the Gas and Flame Service Regiment. The appeal is made to men between the ages of 18 and 40 years. All men between the ages of 21 and 31 years who have not been called in the draft are eligible. The men specially needed are analytical, research and manufacturing chemists, powdermen, men experienced in the production of gas, machinists, automobile repair men, men who can operate

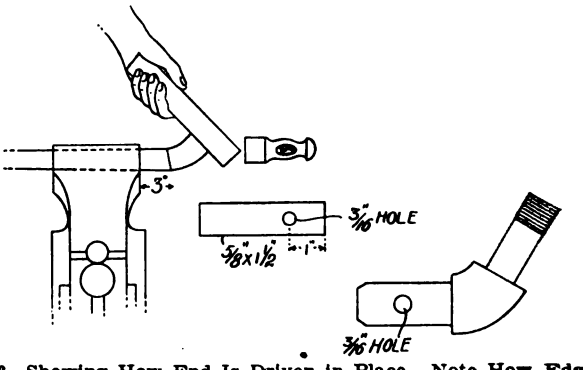

Fig. 3—Showing How End Is Driven in Place. Note How Edge of End is Beveled.

or repair gas or steam engines, pipe fitters, electricians, designers, interpreters, carpenters, blacksmiths, plumbers, boilermakers, and chauffeurs.

All men must first enlist as privates, the rate of pay being $33 per month and all expenses. Men with necessary experience may be assigned to special duties, which will carry increased pay ranging from $40.20 to $96 per month. Colonel A. A. Fries, Corps of Engineers, who is now in France, will command the Thirtieth Engineers. Any army recruiting office will furnish the necessary information to men who desire to volunteer for the Gas and Flame Service.

Home-Made Fuel Funnel.

The disadvantages of using unstrained gasoline are well known and many owners will not allow the fuel tanks to be replenished at a garage utilizing a funnel fitted with metal screen or filter. Such a funnel is practical, however, provided the screen is fine enough and is no coarser than 120 mesh, as water and sediment will not pass through it. A home-made funnel for the garage can be easily made by soldering a section of 120-mesh screen in the bottom of the funnel.

COLLECTING THE MONEY.

Suggestions for Extending Credits, Obtaining Ratings and Form Letters.

BY FRANK FARRINGTON.

In hundreds of calls upon retail dealers throughout the country my question, "What one thing about the management of your business causes you more trouble than anything else?" has been almost uniformly met with the reply, "Credits; collecting what folks owe us."

Practically all merchants who have trouble with the credit side of their business find its source in the difficulty they have in getting the money people owe them. It is necessary to see that the "poor pay" people do not get in too deep, that they pay up promptly, and that folks with plenty of money pay promptly too. There is no profit in any sale until the money is in the cash register.

Losses and Poor Accounts.

It is all right to seek relief from losses on poor accounts by doing a cash business, but there will always be people who cannot pay spot cash and are willing to pay something extra for the privilege of taking more or less time on the account. Without doubt people will buy more freely for credit and the ideal way to make the business big and successful is not the spot cash way. Rather it is through the use of a limited credit with prompt collections.

The smaller a bill, the easier it is paid. As somebody has put it, "A short horse is soon curried." When a bill gets to where it is out of proportion to the customer's pay check, then it begins to drag, and the dragging bill does not wear itself out in the dragging, though it may wear out the dealer's patience.

Value of Time Limit.

By fixing an absolute time limit on all accounts, declining to allow anyone to continue to buy on credit when the bill has not been taken care of within that limit, say, 30 or 60 days, nobody can get in debt to you for more than the purchases of that period. This short-term credit plan is the best way of handling the credit business. It reveals people before their accounts get too large, and those to whom longer credit may desirably be extended can be taken care of by having them clean up the old account by giving a note or a due bill, with or without interest.

The big thing is to get everybody to come around at least once a month and agree about the account and its immediate or its future payment. When you get in touch with a credit customer once a month and discuss with him the account he is running, your chance of loss is reduced.

When a man starts an account it is up to the dealer to know his financial standing and something about his income, also his past reputation for paying promptly. This is where a credit bureau established by some such local organization as the chamber of commerce is good.

Record of Credits.

Such a credit bureau keeps a record of those who ask for credit. The members can get this information at any time and each member may keep a card index with a card for each customer, going to headquarters for information with which to start a card about any new applicant, and passing on to headquarters any new information coming to hand or developing in experience with the family.

These credit bureaus may also act as collection agencies, and since they represent most of the stores in town, for a man to refuse to honor his account with one member may result in credit being refused him by all the members. In fact, the threat of turning the account over to the credit bureau will rarely fail to bring in the delinquent debtor to take up the question of payment in some manner.

One such organization sends out notices to all the people in town when starting its credit bureau and these notices are letters stating that such a central source of information about credit ratings is being established and it is requested that the recipient make a statement to the bureau of his reasons for claiming he is entitled to credit. This gives the bureau a standing with the public at once and makes it apparent that it wants to play fair with everybody.

The First Letter.

The first letter this association sends to the man whose account is placed with it for collection is very friendly and takes the position that there is some misunderstanding and asks him to go and see his creditor and get the matter adjusted. Further notes are more pointed and the final notice states that in so many days the organization's attorney will take action.

But not every community has a credit bureau and some men prefer to work independently, anyway. For such, personal calls and personal letters are the best collecting mediums. It is the personal touch that saves the account. If you can go and see a man and each time get either a little payment or a promise of payment on a certain date, and if you go to see him on that date, this method will produce results.

In the first place, when a man starts an account, there should be no delay in sending him a bill the first of the month following. If he starts the account the middle of the month, send out your monthly statement just the same on the first of the month. Get him accustomed to that monthly bill. Show him you believe that "short credits make long friends." If he is the type of man who cannot endure having his bill presented promptly, he is probably the type from whom you will collect only with difficulty and perhaps his trade is not worth the trouble.

Be Frank With Customer.

If you expect accounts to be settled monthly, explain that fact at first when the account is started. Don't leave anything to be taken for granted, and see that your employees understand that no new account is to be opened without an explanation that there is to be a monthly settlement. Whatever the conditions under which you are to collect, make those conditions plain right at the start and you will save a lot of trouble.

Whether you have a time limit on accounts or not, send out bills promptly and follow them with regular monthly statements. Perhaps the larger part of your customers receive their pay at some other time than the first of the month. Adjust statement day to pay day.

The first bill or two needs no comment perhaps unless it be a printed or stamped heading to the

Digitized by Google

effect that accounts are payable monthly. After it becomes evident that the debtor is not going to take care of the bill properly, then comes the opportunity to write collection letters and this is where the merchant may show his ingenuity or his knowledge of human nature. Better than any form letter is one written especially for the purpose in mind, adapted to fit the individual instance. The letters given below are suggestive of the line of attack to be followed:

FIRST LETTER.

Dear Sir.—You will be interested in knowing just how much your account with us is at the present time.

It is against our policy to allow anyone to run an account more than 60 days, but possibly we have neglected to tell you about this.

We are sending this bill because it is now due and because we feel it unfair to extend greater favor to one customer than to others.

May we have your check in a day or two?

Cordially yours,

SECOND LETTER.

Dear Sir.—The high cost of living hits us two.

We cannot afford to extend credit in the old-fashioned way. Goods cost us much more and we have to pay for them in less time.

In order to do business without increasing prices unnecessarily, we must ask prompt settlements from our customers.

We are sure you will see the justice of this and remit promptly for the enclosed bill.

Cordially yours,

Perhaps you do not want to start in as mildly as this with the creditor you have in mind. Then you can begin with letter number three where it begins to put the screws on a little.

THIRD LETTER.

Dear Mr. Haskins.—You surely must have received our bill with a request for an early settlement.

Perhaps you are unable to settle the account in full and for that reason have not called or sent a check.

It is important to us that we get the matter adjusted in some way, so we are going to ask you to call and make a payment on the account or arrange for taking care of it later.

Of course you realize that a business man cannot neglect such a request for attention to a debt without affecting his credit.

Let us get together on this right away and have a friendly adjustment of the manner of settlement.

Cordially yours,

FOURTH LETTER.

Dear Mr. Haskins.—You still owe us $43.

If we did not know you for an honest man, it would certainly seem very strange that you have paid no attention whatever to our requests for a settlement.

Is there some mistake in the account? Are you unable to pay the bill now? Have you been unfairly treated at any time by us?

Whatever the reason for paying no attention to our requests for a settlement, please come in or write us about it and let us get together on the matter.

We cannot let the account run on indefinitely and we believe you will admit that you have had more time now than we ought to have to give our trade.

Don't postpone action in this matter. You really cannot afford to do so.

Yours very truly,

FIFTH LETTER.

Dear Sir.—It is costing us 6 per cent. to carry your account.

We cannot afford to carry the additional expense of uncollectible accounts, and we are determined not to do so.

Your bill amounts to $43.

We are willing to do anything that is right about arranging a settlement, but we are determined not to carry the account longer if you are not even willing to come in and talk the matter over with us.

Unless we hear from you (see you) about this within five days, you may look for an opportunity to settle with our attorney.

Please don't compel us to take this step. We much prefer to adjust the matter with you ourselves.

Yours truly,

NEW RULING ON CAR TAX.

Machines Held for Retail Sales Exclusively Are Exempt—Changes Taxed.

A new ruling has been made by the Treasury Department relative to the tax on motor cars. New machines which dealers have been holding for retail sale and have been in stock since October 4 are not to be taxed where a dealer does only a retail business or where he does both wholesale and retail, but maintains separate departments. The former ruling was that all passenger and commercial cars held for sale on and after October 4 should be taxable at 1½ per cent. The more recent ruling is as follows:

First—Any dealer or distributer who completes a vehicle and offers it for sale is subject to the 3 per cent. tax. This applies to a dealer adding a new body to a chassis or any person converting a touring car into truck by adding an attachment.

Second—Trucks and cars sold to the government will not be tax exempt. Manufacturers to get the tax must add it to the price of the goods before selling to the government.

Third—A dealer who is both a wholesaler and retailer and handles two different makes of cars under two separate contracts, with one contract providing for retailing only, is exempt from the floor tax on cars under the retail contract, but he pays the tax on all cars on his floor under the contract were he a wholesaler and retailer without separate contracts.

Fourth—Those car manufacturers selling through branches and whose branches are a part of the parent company and not separate corporations must pay the 3 per cent. tax on the sale price received whether wholesale price or list price.

Purchaser Not Responsible.

According to a recent decision, when a dealer ships by railroad to a buyer the latter is entitled to protection and the shipper is responsible for goods lost or damaged in transportation.

A dealer sold tires valued at nearly $100, and which were to be shipped from New York to Allenhurst, N. J., by express. The buyer paid in advance, and the seller shipped them without declaring their value, which had the effect of limiting the express company's liability to $50.

The tires were lost on the way, and the buyer notified the dealer, who made a second shipment. When the dealer attempted to collect for the second shipment the buyer refused to pay, claiming that because of the dealer's negligence he could get only $50 for the goods for which he had paid nearly $100. The dealer thereupon sued the buyer for the amount of the second shipment, but the court refused judgment against the buyer, saying:

"Unless otherwise authorized by the buyer, the seller must make such contract with the carrier on behalf of the buyer as may be reasonable, having regard to the nature of the goods and the other circumstances of the case. If the seller omit so to do, and the goods are lost or damaged in course of transit, the buyer may decline to treat the delivery to the carrier as a delivery to himself, or may hold the seller responsible in damages."

The court pointed out that some time ago a case was decided in the same way, where an agent shipped an automobile and accepted a bill of lading in which liability was limited to $100—116 Northeastern, 781.

Why Bulbs Discolor.

After considerable service the electric light bulbs utilized in car lighting become discolored, black. This is due to the heat making the filament evaporate, sublime (to pass from a solid to a gaseous state, and again condense to a solid form), and the particles settle on the inside of the bulb. Less current is consumed when in this condition, as the filament is thinner. The light, however, is less efficient, for most of it is absorbed before it gets out.

TRUCKS IMPROVE SERVICE.

One-Ton Cars Replace Three Two-Horse Teams and Increase Deliveries.

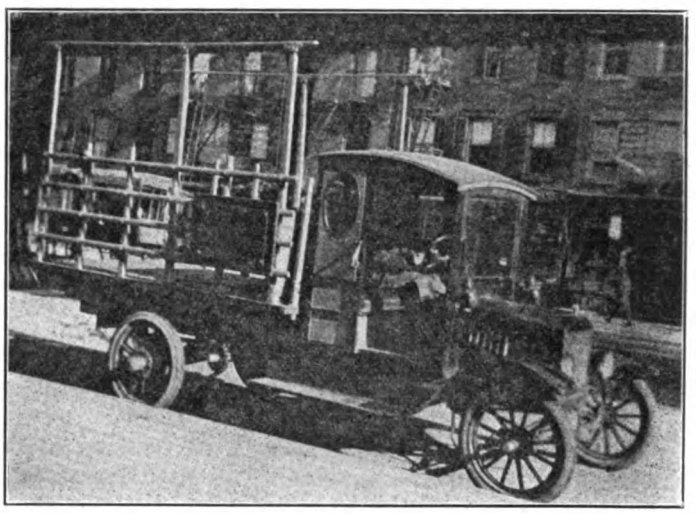
BY C. P. SHATTUCK, M. E.

There are two factors that are rapidly revolutionizing delivery methods in New York City and its surrounding territory, and these are service and competition. The public is largely responsible for that service now obtaining in this large city, for the people of Greater New York and surrounding territory have been educated to that service which obtains merchandise on the same day as purchased.

As a result of the demand for this service many business concerns have been practically obliged to replace their horse-drawn equipment with the more tireless, rapid and efficient commercial car. In other words, many concerns have found the gasoline propelled vehicle indispensable in serving clients formerly taken care of by the more slower moving horse or express service.

Competition is a factor in merchandising. The large wholesale house or the concern acting as a distributor for manufacturers find that their customers now expect delivery by motor vehicles because it is more rapid than with the horse and because the wholesaler's rival has motor equipment. As a result of this competition a number of concerns are experimenting with the use of the commercial car. Some of these have achieved the results desired, that of efficient and economical service, while others have found transportation by the automobile more expensive. Invariably when such be the case it will be found that the merchant is not operating his car or cars efficiently, that his routing and loading methods are those utilized with the horse-drawn equipment and which do not permit of the motor car being operated at its maximum capacity.

An example of how a commercial car may be operated successfully is noted in the case of Joseph Wild & Co., New York City. This concern manufactures and imports oriental rugs and carpets and does an extensive business in mats, matting, linoleum, wall hangings, robes, feltings, etc., having been established since 1873.



Supplying as it does both the retail and wholesale trade, the company is frequently compelled to make prompt delivereies, these including many special orders. Although large capacity trucks are utilized for transporting goods to and from the roads, etc., the company had, up to within two years ago, relied upon horses to make city deliveries and an express service for suburban service.

After investigating the possibilities of the delivery type of motor car the company purchased two one-ton Smith Form-a-Trucks, made by the Smith Motor Truck Corp., Chicago, Ill. One of these machines was placed in service in New York, where it is utilized for making city deliveries and supplying the trade in the metropolitan districts and Long Island City. In the afternoon the car serves the retail trade in the lower part of the city, also makes a number of trips over the bridge to the Brooklyn districts where the factory is located. In addition to this work the machine hauls goods from the factory to the warehouse and carries capacity loads from railroads, etc., to warehouse and store. The second Smith Form-a-Truck is employed at Staten Island at the plant of the American Linoleum Mfg. Co., for which Joseph Wild & Co. is distributor. This truck hauls goods to and from tidewater, etc. The machines are equipped with the conventional type of stake body.

An example of the service being obtained with these cars is the fuel and oil utilized during last month. The New York City car used 112 gallons of gasoline, 12 quarts of oil and traveled 1,099 miles. This is about 12 miles to a gallon of gas and 100 miles to a quart of lubricant, an excellent showing when it is considered that much of the work is in heavy traffic.

The two cars not only have replaced three two-horse teams and eliminated much express service, but have greatly increased the radius of delivery. The improvement in service is also pronounced. The company believes in employing high-grade drivers and these are thorough mechanics, having fitted themselves for the positions.

The company also has in service a Ford truck unit made by Hayes-Diefenderfer, New York City. This machine has been in service two years, during which period the only time that has been lost was during an overhaul. The driver of this car is a thorough mechanic, and the machine has given the best of service since the day it was placed in commission. It is used to make trips to New Jersey, replaces express service, transports capacity loads and has proved a time and money saver.

Smith Form-a-Truck in service with Joseph Wild & Co.

Omaha A. T. A. Elects Officers.

At the annual meeting of the Omaha Automobile Trade Association, which holds its thirteenth annual show February 25-March 2, inclusive, J. T. Stewart, 2d, was elected president. Guy L. Smith was chosen vice-president, and Clarke G. Powell, secretary-treasurer. These, with Lee Huff and E. R. Wilson, constitute the board of directors for the ensuing year.

To Teach Women Mechanics.

A pleasure car distributor in St. Louis, Mo., is conducting a school to teach women how to operate and repair motor cars. According to his statistics those who have registered for war service know little about the repair of a car. The figures show that 37 per cent. know how to drive and only three per cent. know the automobile mechanically.

Digitized by Google

PASSENGER CAR A NON-ESSENTIAL.

War Industries Board So Rules and Proposes to Take Over Factories.

The announcement of the War Industries Board proposing to restrict the production of passenger cars from 40 to 75 per cent. by prohibiting the shipment of steel to automobile manufacturers, and to take over wholly or in part factories for munition purposes, came as a distinct shock to the members of the industry and its allied trades. The proposed action of the board and on the ground that passenger cars are "luxuries and non-essentials," is particularly disappointing to those members of the industry who at the outbreak of the war offered their services and plants to the government.

That the product of the industry, the third greatest in the country, should be classified as a "non-essential and a luxury," that those responsible for this ruling should overlook the fact that it has been proven that 80 per cent. of the so-called "pleasure cars" are utilized commercially, are features of the ruling that indicates that little if any consideration is being given to an industry patriotic enough to curtail its production from 25 to 40 per cent. in order to co-operate with the government. (A number of factories have given over equipment for the manufacture of munitions, etc.)

In defining the passenger car as a "luxury and non-essential" the Board must have been influenced by the fact that many owners utilizing their cars six days a week for business purposes employ them on Sunday for pleasure. This is a practice not alone confined to the motorist of the city but to the farmer. If an automobile used under these conditions be a luxury then the work horse used on Sunday to haul the family surrey must be a "non-essential."

The shortage of steel is said to be one of the reasons for the drastic ruling of the Board. According to one of the greatest authorities on steel only five per cent. of the annual output is utilized by the automobile industry. It is also stated that the production of steel can be increased 10 per cent. within 90 days, that it is not a question of a shortage of materials such as chromium, vanadium or other chemicals needed in the steels, but rather a question of efficiency of labor. A thorough investigation of the steel industry is suggested and will be welcomed by the automobile industry.

Not only will the car manufacturer be dealt a severe blow if the proposed drastic measures be carried out, but approximately 53,000 garages, dealers and those handling motor vehicles will be affected. The small business man or the large one, for that matter, cannot adjust themselves instantly to the conditions that would obtain from the proposed plan of the War Industries Board. The investment of the small dealer or garage man is as important as that of the manufacturer with hundreds of thousands of dollars involved, and the small dealer is entitled to consideration.

It is to be hoped that the committee appointed by the automobile industry and which represents the National Automobile Chamber of Commerce, Motor and Accessory Manufacturers and the trade, will, in the coming conferences with the War Industries Board, convince that body that the product of the third greatest industry in the country should not be classified as "luxuries and non-essentials," that the rating of the passenger car in the same class as pianos, moving pictures, etc., is most unfair to an industry which to a man is behind the government in its present time of need.

There can be no question as to the patriotism of the automobile industry and its allied branches. There is no doubt that should the occasion arise the industry would 100 per cent. co-operate with the government. The present problem is not one of patriotism. It is a case of where, if the proposed plans are consummated, an industry rated at $1,300,000,000 is not given time to adjust itself to new conditions, to make the conversion gradually as it should be made.

May Have to Pass a Test.

The increasing number of accidents in the State of New York, many of which occur at grade crossings despite the warnings of the railroad companies to drivers who persist in trying to cross ahead of rapidly moving trains, may result in a law being passed compelling every driver to pass a test as to his ability, etc.

In an effort to decrease the number of accidents the Secretary of State is to show a series of moving pictures illustrating the right and wrong way to approach a street car taking on or discharging passengers, and the man who attempts to cross the railroad track ahead of a train, etc. Among the scenes are those showing the congestion of traffic in New York City and how it is handled by the traffic squad. Special attention is given to women, who are daily swelling the ranks of expert motor drivers.

The pictures do not spare the careless pedestrian or the absent-minded stroller who crosses the street at any angle, while the boy who darts in and out in the traffic of the busy street is taught a salutary lesson. The pictures are to be released and shown in the moving picture houses throughout the country.

Increase Wisconsin Fees.

Receipts for motor vehicle license fees of all classes reported by the State of Wisconsin for the fiscal year ending August 1, amounted to $834,142, compared with a gross of $575,798 for the previous fiscal year. The cost of administration was $39,069, and after this sum is deducted 25 per cent. is placed in the State highway fund and 75 per cent. is redistributed pro rata among the seventy-two counties of the State where licenses originated. During the new fiscal year, receipts will increase even more, as the annual license fee for private owners has been increased from $5 to $10 per annum, effective January 1, 1918.

To Aid in Fuel Saving.

One Chicago gas company has been using 80,000,000 gallons of petroleum oil yearly in making illuminating gas. This is slightly more than the navy's consumption of oil last year, the oil being used to enrich water gas. The company will now erect a new plant in which gas will be made from coal on the by-product principle, producing illuminating gas without the use of petroleum, yielding benzol, toluol, and other coal-tar derivatives, and also half a million tons of coke yearly for household consumption.

NUMBER THE STEERING COLUMN.

Says Plan Would Greatly Reduce Number of Cars Stolen.

The police department of New York is giving considerable attention to the stolen car problem. During the first six months of the present year 874 machines were reported as stolen. Of these 758 were recovered, and 283 arrests were made, leaving 116 cars still missing. Of the 758 recovered, 164 are listed as doubtful cases of theft, because they were recovered within 24 hours, many only a short distance from the place where they were taken, and nothing had been removed from them.

Secretary of State Hugo, who has been studying the problem with the heads of the police department, makes a novel suggestion for making it a simple matter to identify the stolen car. He suggests that the engine number be affixed also on the steering column of the machine.

"This is a part of the automobile," he says, "which is rarely, if ever, changed, and the numbering of this part to correspond with the engine number would serve several purposes.

"In case of theft, it would prove of great value in identifying the car. Also, it would act as a deterrent, as the removal of this number by the thief would be readily discernible.

"Again, it would save the purchaser of a car a great deal of trouble in making application for registration, as the number would be easily located.

"The affixing of the motor number at a point, say, six inches below the steering wheel would entail little if any extra expense on the part of the manufacturers. I believe this is a matter which might properly be presented to the manufacturers by the dealers through whom the cars are sold, and make the suggestion accordingly."

The manager of a large insurance company endorses the plan and believes that the owner can do much toward reducing the number of thefts. He says:

"The owner himself can do a great deal more than is usually done toward mitigating the automobile theft evil. The carelessness shown by scores of owners in leaving their cars unprotected and unlocked in the streets is amazing. There is no locking device that the expert motor car thief cannot beat, if he is determined to steal a car and has the opportunity to do so. Nevertheless it is a valuable preventive, and if observed more carefully it would reduce by a large proportion the number of cars reported stolen, but which have been used for joy riding. Many cars which technically have been stolen are recovered within 24 hours. Meanwhile an alarm has been sent to every police precinct in the city. The owner is miserable because he believes his car has actually gone, and if insured he prepares to collect as early as possible from the company. If the owner had merely been thoughtful enough to lock his car it would have stopped the average joy-rider from going off with it."

Cleveland After Auto Thieves.

The police of Cleveland, O., are conducting a vigorous campaign against automobile thieves. Recently they established a dead line around the city just outside of the business district, utilizing over 100 policemen and officers divided into squads, and every main road was guarded. These squads stopped every car as it approached and the driver was asked "What's your license number?"

If the driver knew, or if the party in the car were obviously a man and his family, the car was permitted to proceed. In cases of suspicion the car was run around the corner into an "inquisition zone" for further questioning of the occupants, and in some cases the cars were run to the nearest precinct station before a clean bill of health was issued.

In practically all instances motorists submitted good-naturedly, realizing that unusual methods were needed to cope with the extraordinary prevalence of theft.

Oil Exports Increasing.

More mineral oils were exported from the United States during the fiscal year 1917 than ever before, the total amounting to 2,749,438,434 gallons, valued at $230,953,149, according to figures made public by the Bureau of Foreign and Domestic Commerce of the Department of Commerce. This was an increase of approximately 300,000,000 gallons and $65,000,000 over 1916 and about 470,000,000 gallons and $79,000,000 over 1914, the last normal year before the war. Only a small percentage of the total exported was crude oil.

The war has had the effect of reducing the exports of illuminating oil. Exports of gas and fuel oil have more than doubled in quantity and value in the last three years, increasing from 475,153,205 gallons valued at $13,747,863 in 1914 to 1,040,671,713 gallons valued at $32,473,872 in 1917. The exports of gasoline and lubricating oils have also increased substantially.

Tractors to Aid Farmers.

When the newly appointed State Food Control Commission of New York begins its duties it is expected that one of the first steps to be taken will be the purchase of 50 gasoline tractors with their necessary plows and fittings. These are to be placed among the farmers of the state and will be largely used to prepare the ground for next season's wheat.

By the regulations governing their use, no charge for rental is to be made to those desiring their services, but the man whose ground is cultivated by a state-owned tractor is charged for the gasoline used and for the operator's time. Fully 1,000,000 bushels of grain will be raised on the ground prepared during the next few weeks by these machines if the plans for their most effective use are followed out.

Cause of High Speed Slipping.

One of the troubles sometimes experienced with cars that have seen considerable service is the high speed slipping out of engagement. This is caused by worn jaw clutches or dogs of the intermediate gear which are meshed with the constant mesh gear when utilizing the high. The trouble can generally be overcome by grinding the clutches to restore their contours.

Motorcycles are now admitted to the Yosemite National Park. They were barred as some of the roads were considered too steep and dangerous for their use. These roads have been improved.

A Non-Skid Road.

In the mountainous districts of western Maryland an experiment is being conducted, and closely watched, on what is claimed to be a non-skid surface. This road is a tar-bound macadam on a water-bound macadam foundation. Several grades of tar binder as a surface treatment have been previously used, but under heavy rolling and continued traffic the binder has flushed up through the stone chip covering, making a smooth surface which became very slippery when wet.

This year a special grade of Pontar was used on the surface as a binder, and it is hoped a non-skid surface has resulted, for up to the present time the results have been very encouraging. The binding material used has not flushed up under the roller and traffic as have previous treatments, and the resulting surface pitted, somewhat after the fashion of smallpox markings. Under wet weather conditions this has proven a great benefit, as the skidding of automobiles and trucks has been greatly reduced, and the footing is much safer for horses. This experiment is being watched with great interest to see how effective it is under winter conditions of ice and sleet.

Novel Touring Equipment.

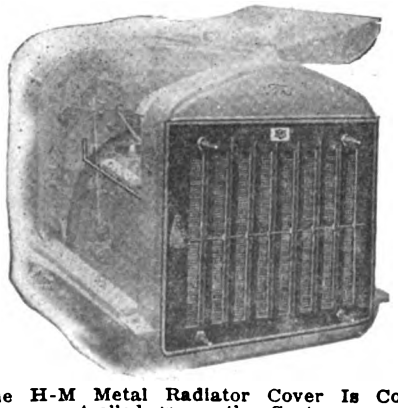
A motorist with considerable experience in transcontinental touring has designed and constructed a novel automobile clothes press and a full length bed. The press consists of a khaki bag with wide mouth, into which is sewn three cross bars or curtain poles, the whole being inclosed by a wide flap. From the three curtain bars are hung from three to six regulation coat, trouser and skirt hangers. The entire unit being suspended by two metal hooks from the rear top bow in the tonneau, permits carrying a number of suits suspended full length and free from dust and wrinkles.

The full length automobile bed is suspended crosswise in the car just above the tops of the seats, leaving the tonneau and back seat for a dressing room for the two occupants. A 10x18 khaki container, spiked at the four corners, serves in daytime to carry the entire bedding outfit, lashed securely to the running board, while at night it covers the entire car, making the sleeping quarters snug even in a rainstorm.

Yellow, but Just as Good.

It is suggested that our gasoline supply may be increased considerably if motorists will overcome an unwarranted prejudice against yellowish gasoline. In the early days of the oil industry poor refining methods were responsible for the production of yellowish kerosenes and gasolines, which were sometimes dangerous. This led the public to demand that gasoline be "water white," and the prejudice has hindered the development of cracking processes which produce perfectly safe gasoline with a slightly yellowish tinge. Another handicap in the industry, according to petroleum experts, is the necessity for refiners treating gasoline with sulphuric acid and caustic soda to remove unsaturated hydrocarbons which have high fuel value in an explosion engine. It is estimated that there is a loss of $10,000,000 a year in the United States through these prejudices, represented by 30,000,000 gallons of gasoline, 35,000 tons of sulphuric acid, and 3,500 tons of caustic soda.

Replenishes Oil Supply.



A reader who states he has experienced no carbon trouble for over 6,000 miles attributes his freedom from carbon troubles to the changing of the oil supply in the crankcase every 1,000 miles. The lubricating system is thoroughly cleaned and new oil employed. While this means a loss of a gallon or more of oil every so often, the cost is compensated for by greater efficiency from the engine. Oil will lose its lubricating qualities after it has been in service a certain length of time.

You can buy a nice car for about a hundred iron men. Of course, the ones with engines in cost more.

NEW AND INTERESTING THINGS IN MOTORDOM

The H. M. Metal Radiator Cover.

The latest device for winter touring

The H-M Metal Radiator Cover Is Controlled From the Seat.

is the H-M metal radiator cover for Ford cars. One of the most important features of this radiator cover is the fact that it is operated from the dash of the car, thus eliminating the necessity for the motorist leaving his seat and walking to the front of the car to adjust the cover.

Another important point is the adjustment feature. The cover may be entirely closed, half, three-quarter, quarter closed or entirely open, depending upon weather conditions, and can be instantly changed from one position to another by means of a pivot in the dash of the car.

The H-M metal radiator cover is made of sheet metal divided into eight adjustable shutters operated as one. It is attached to the radiator with springs, assuring a tight fit at all times and doing away with the possibility of rattling.

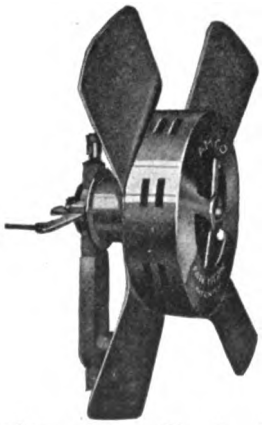
They are staunchly constructed and may be used many seasons, therefore are most economical to buy. The H-M Manufacturing Co., Indianapolis, Ind., are the makers of this practical device.

A Baby Seat Attachment for Automobiles.

The Perfection Mfg. Co., 2700 N. Leffingwell avenue, St. Louis, Mo., are manufacturing and marketing a unique contrivance known as the Rock-a-Bye auto seat. It consists of a brown washable duck basket mounted on an enameled steel frame, the basket containing two holes through which the baby's legs are inserted. Two small steel cleats, three inches long, are furnished with the outfit, which can be permanently attached to the back of the front seat of any automobile in a few minutes, and in which the hooks of the Rock-a-Bye seat are engaged and sustained. All parts that come in contact with the polished surface of the auto are protected by means of soft rubber, preventing entirely the marring or scratching of even the most highly polished surfaces. The Rock-a-Bye seat is easily and quickly attached at any time by simply inserting the

Digitized by Google

hooks in the slots and detached by lifting the hooks out of the slots. When not in use, the Rock-a-Bye folds up and easily fits under the seat of the automobile. The Rock-a-Bye auto seat weighs four pounds and is not only safe, sanitary and low priced, but affords baby a



The Rock-a-Bye Auto Seat.

comfortable permanent place in any automobile instead of being jammed between the occupants anywhere as heretofore. It relieves mothers of a great deal of care when out riding.

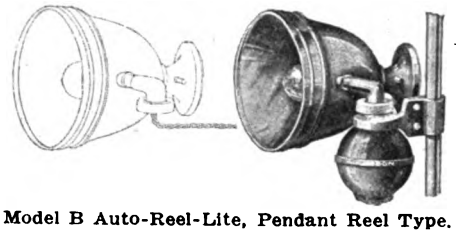
A Signal With Tone Range.

Desirable as such a feature is acknowledged to be, there has never been an automobile warning signal with a range of tone, except the extremely high-priced musical instruments. A unique, new device, illustrated below, has now been put on the market. The Fanhorn, as this distinctive type of signal is termed, is designed to emit tones whose volume and penetrativeness is in direct proportion to the car speed. This result is achieved by the simple expedient of making the Fanhorn a part of the fan of the engine, in fact, the entire device is merely substituted for the present fan on any car, with no other alterations. It is claimed that the cooling efficiency of most cars is increased by the Fanhorn. The tone of the Fanhorn is best described as a cross between a whistle and a whoop, with the acknowledged effectiveness of both—instant attention and rousing urge to action. The tone is pleasing as well

The Fanhorn—A New Warning Signal.

as commanding. As the pitch changes with the engine or car speed, maximum carrying power is obtained at highest speeds, an ideal arrangement. The position of this new type of signal, at the extreme front of the engine, avoids obstructions to the sound. The Fanhorn is said to be impervious to wiring and battery troubles, worn contacts, weak diaphragms and kindred ailments. It is entirely different from the usual siren because the full volume of sound is instantly available without "working up" to it and no effort is required on the part of the driver, other than pushing a button. City drivers especially will realize the advantages of a signal that cannot be operated in their absence from the car. Pressure on the button automatically admits air into the apertures of the Fanhorn drum, also sets into motion an internal, revolving slotted disc, which produces the warning tone. The Art Metal Manufacturing Co., Cleveland, O., makers of AMCO automobile specialties, manufacture the Fanhorn. It will be marketed through the dealers authorized to handle "AMCO" specialties in every city. The manufacturers guarantee the material and workmanship of the new signal for a full year, and stand back of the dealer on a broad money-back-if-not-satisfied policy. The appropriate selling slogan of the Fanhorn will be "Sells on Sound."

Perfection 5-In-One Vitalizers.



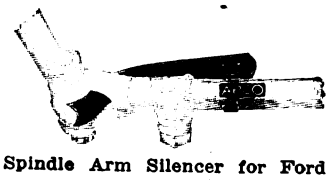
The Snyder Products Co., 4046 Washington boulevard, Chicago, Ill., is now manufacturing and marketing the Perfection 5-In-One vitalizers, formerly handled by the American Spring & Tire Co. This device is described by the manufacturers as the greatest heating unit built for vaporizing gasoline. It is a combination device, comprising as it does, a primer super-heater, electric super-heater, decarbonizer and gas economizer, and it is claimed that it will greatly increase the power and mileage of the car, also causing less carbon and less trouble. It instantly vaporizes gasoline, irrespective of temperatures. Readers who are interested should write direct to the manufacturer for prices and complete information.

Make Your Ford a Winter Car.

Above is the very attractive heading used by the J. & B. Mfg. Co., Pittsfield, Mass., in their latest advertisement. This announcement calls attention to the J. & B. gasoline injector. If your Ford car is equipped with this device, one or more light pulls on the "injector ring" which projects through the radiator will spray gasoline directly into the manifold at the intake ports of the cylinders, making starting the engine as easy as on a hot day. The retail price of this device east of the Mississippi is $3.00 net, and in the West the price is $3.25 net. Readers who are interested should send their inquiries and orders direct to the manufacturers, the J. & B. Mfg. Co., Pittsfield, Mass.

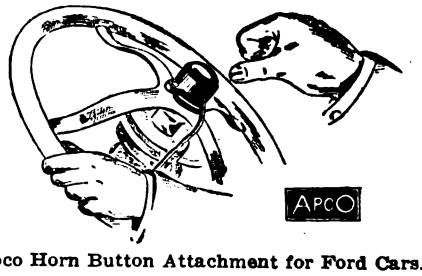
The Auto-Reel-Spot-Lite.

We illustrate the Auto-Reel-Spot-Lite. This is a novel extension trouble light. When attached to the windshield it is a dirigible searchlight which is absolutely effective. In addition, this lamp is attached to 12 feet of extension cord so that it can be lifted from its bracket and removed for the purpose of inspecting any part of the car. The convenience of such a device when a car breaks down on the road or for night work in the garage is too obvious to need explanation. While touring the dirigible searchlight feature may be used for locating ditches, marking the edge of the roadway, illuminating dangerous corners and turns, turning around or backing the car, reading road signs, house numbers, etc. In camp this lamp could be hung on a convenient tree or tent pole and gives a brilliant illumination covering the wide area, and every motorist, auto-camper, farmer and motor-boat enthusiast will certainly appreciate the



Model B Auto-Reel-Lite, Pendant Reel Type.

automatic extension feature which does away with the less reliable pocket flashlight and the uncertain and dangerous use of matches and candles. This device is manufactured by the Anderson Electric Specialty Co., 562-564 W. Van Buren street, Chicago, Ill., to whom all inquiries should be addressed.

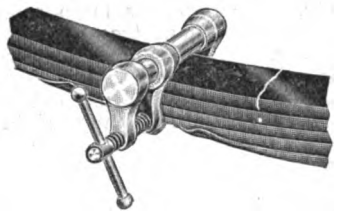


Two New Apco Specialties.

The extensive line of specialties for the Ford car and made by the Apco Mfg. Co., Providence, R. I., has been augmented by a spindle arm anti-rattler or

Apco Spindle Arm Silencer for Ford Cars.

silencer. The bushing of this part wears very quickly and when worn is the cause of that lost motion which makes the front wheels wobble and sets up an annoying rattle. The Apco silencer prevents these troubles and consists of two heavy formed springs which are easily and quickly attached with the fingers. They come two to a set, are finished in black enamel, and sell at 40 cents the set. The horn button attachment which places a button for sounding the electric horn on the top of the steering column or center of wheel, is now being supplied with a neat button whereas for-



Apco Horn Button Attachment for Ford Cars.

merly use was made of the Ford button. This device comes complete with wires, etc., and is a valuable addition to the car as the driver does not have to remove his hand from the wheel to sound the horn. The new attachment sells at 50 cents complete or attachment without button 25 cents.

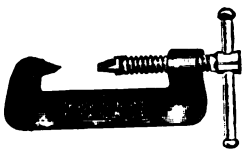
Knowlson's Spring Spreaders.

The Spring Leaf Lubricator Co., Ann Arbor, Mich., is making a new spring spreader in addition to their regular tool. It lists at $1.00, and is known as Knowlson's No. 3. It is attractive,



Knowlson's Spreader Applied to Spring.

strong, durable and is made upon correct lines. The yoke is drop forged, highly polished in oil and has a mottled or gun metal finish, while the screw and handle are dull nickel plate. It will span springs of 3 inches wide or under. It is essential that in the care of the car or truck the springs should have every attention. To allow them to rust not only produces the annoying squeaking, but a heavy jolt is almost sure to break them. The quiet running car is the car with its springs regularly lubricated, and with a Knowlson spring spreader it is an easy matter to keep the springs properly lubricated. The Knowlson No. 1

Knowlson's No. 1 Spreader.

spring spreader, their standard tool, is made of drop forgings, nickel plated and highly polished. It lists at $1.50. The proper lubricant for springs is a heavy grease or a grease and graphite mixture. Oil will, for a short time, stop the squeaking, but the operation of oiling has to be repeated too often to obtain the desired results. A heavy grease is preferable owing to its lasting qualities.

Knowlson's No. 3 Spring Spreader.

The No. 1 tool, as a temporary repair clamp, cannot be improved upon and should be in the tool kit of every car. Should you have the misfortune to break a spring, this tool will bind it securely, allowing you to proceed or return in safety. It takes but a moment to attach it.

Curtis Correct Pressure Tire Filling Station.

The Curtis Pneumatic Machinery Co., St. Louis, Missouri, is placing on the market a tire filling device for garages, and there has been such a demand for this article that it has been almost impossible to fill orders. The company, however, expects to be in a position to make deliveries on this machine in time for the season of 1918, and it will be exhibited at the New York and Chicago shows. Some improvements have been made in the tire filling station which makes it even more desirable. The same company also makes the well known line of Curtis garage air compressors. These compressors are made in five different sizes of simple machines and over 125 combinations of electrically driven outfits. The distinguishing feature for the garage equipment is the control of the splash oiling system, which so effectively regulates the cylinder lubrication that oily vapor is prevented from going into the tires.

Tinol Flux Paste.

This is a specialty which should interest every repairman. It is not a new and untried article, but has been on the market for many years. This flux paste does not eat or rust copper, brass, iron, steel or any metal as it is absolutely noncorrosive. Tinol flux paste has a new and important action; as it evaporates it leaves behind it a thin coating and clean, bright tin, to which the solder adheres readily. It will instantly tin a new clean iron. This paste will not injure the most delicate fabrics, such as the silk insulation on electric wires and it has so little irritating action, that it can be spread with the fingers. This flux paste is manufactured by Hess & Son, 1031 Chestnut street, Philadelphia, Pa., to whom all inquiries should be addressed.

B-W Ammeters.

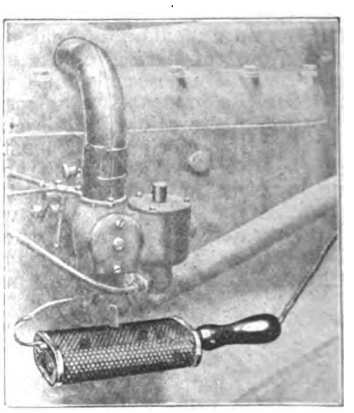
The B-W direct current ammeters are sturdily constructed, so that they will retain accuracy under the most severe conditions. These ammeters are handsome in appearance and are made in both the flush and surface types. They are finished in bright nickel or black rubberoid, as desired. The retail price of this ammeter is $1.90 and it is manufactured by the Ballman-Whitten Mfg. Co., 2867 Gravois Avenue, St. Louis, Missouri. This company will be glad to send complete illustrated catalog to all readers who may be interested.

Twitchell Gauges as Xmas Presents.

The perplexing problem of what to give to a motoring friend as a Xmas present is made very easy of solution by the Twitchell Gauge Co., Chicago, Ill., which has prepared a special holly and mistletoe box for use by dealers in "dressing up" the exterior of the container in which the gauge is ordinarily sold. These decorative covers are furnished free to the trade and make a strong appeal when displayed on counters or in the windows.

Bearings Co. Comes to New York.

The Bearings Co. of Pennsylvania, have opened a branch office in the heart of automobile row, 1864 Broadway, New York City. Their growing business enforced this expansion. A complete stock of bearings is maintained for the accommodation of their trade in the metropolitan district. A sales agency has been installed at 293 Halsey street, Newark, N. J., under the direction of the New York branch. P. C. Christman is in charge.



The Presto Electric Heater.

We illustrate a very practical and useful device, called the Presto electric heater, the object of which is to keep the automobile engine and carburetor warm in the coldest weather. Many cars are kept in cold garages, at the risk of

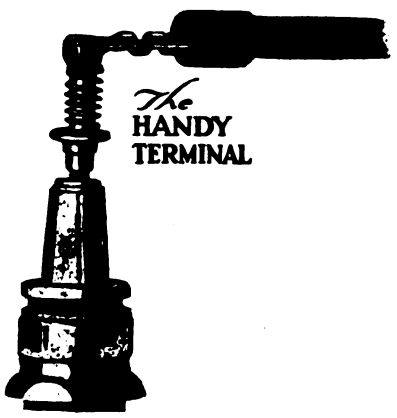
Presto Electric Heater.

cracked cylinders and burst pipes, but if in an unheated garage this danger is removed by the use of the Presto electric heater. The illustration gives an excellent idea of the appearance of this device and it is also shown applied to the engine. All the user has to do is to screw the plug into the nearest light socket, put the heater under the hood, close to the engine, carburetor or radiator, and go to bed, assured of the fact

Presto Heater Applied to Carburetor.

that when he goes to the garage in the morning he will find the engine warm, making starting easy. This convenience alone makes the price of the Presto electric heater insignificant to the average car owner. This invention is also a great seller for dealers. It is manufactured by the Metal Specialties Mfg. Co., 338-352 North Kedzie avenue, Chicago, Ill., to whom all correspondence should be addressed.

The Handy Terminal.



A. E. Francis, known to the racing world as "Smoky" and to the accessory trade as president of the Francis-Rand Co., has recently patented and placed

Digitized by Google

on the market a terminal that it is claimed eliminates all terminal troubles. Mr. Francis found the need of such a terminal while in the racing game, it having been his unfortunate experience to have lost many an important race because of loose connections. He also knows what it is to have to fish a terminal nut from an oily crank case and to have his fingers burned in loosening the terminal nut. The Handy terminal is really a cable terminal and spark plug terminal all in one. The jaws of the Handy are threaded on the inside and engage the threads of the spark plug center bolt. One motion raises the ring, compresses the steel spring, releases the terminal and lifts it from the spark plug. There are no nuts to tighten or loosen or fish out of the drip pan. No tools are required. Can be attached or detached in one second.

Most ignition troubles can be traced directly to loose connections caused by vibration and jar. The Handy can't work loose—the greater the vibration the tighter the jaws of the Handy grip, the better the electrical contact.

The method of fastening the magneto cable insures a permanent connection. The ferrule is fitted to the cable and the

Made by Francis-Rand Co., Cleveland, O.

stripped wire firmly held by a copper clip, making a non-soldered connection that can't work loose.

The Handy is made in three sizes to fit every make of spark plug. Owners of all kinds of motor driven vehicles such as automobiles, trucks, aeroplanes, motorcycles will welcome this trouble proof terminal. The Handy sells for 25 cents each.

A New Window Regulator.

The Liberty Works, Egg Harbor, N. J., is manufacturing and marketing an improved window regulator suitable for any type of body, one of the chief features of which is the simplicity of installation and removal. When the wood is properly laid out, it is impossible to install the regulator improperly. No adjustment is required, nor fussing with a fence. In case it is necessary to remove the device, it can be lifted out of its socket as a unit in a few minutes without having to disturb the upholstery. Another feature of importance is the folding handle, the opening of which unlocks the device, and folding the handle locks it. There is no big hook handle to catch clothes or otherwise annoy.

A side or off-set drive is also provided for use in side quarters, by means of which the actuating handle is taken out of the way of the arm rest. The device is stated to weigh five pounds per pair less than any similar device now offered. It is of sturdy construction, all movable parts carried on ball bearing. Patents have been secured on the general construction of the device. Other patents are now pending covering the handle and method of installation.

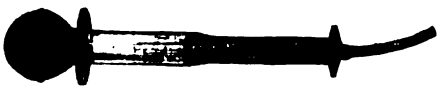
Particulars will be cheerfully furnished to those who may be interested. This company also manufactures exclusive designs and patterns in bouquet holders and lighting fixtures, and special attention is directed to their tonneau bow light. By turning the body of the lamp the current is turned on or off.

Sanitary Wire Running Board Mat.

Every car owner knows the annoyance and disadvantage of using a car in muddy weather owing to the large amount of dirt which is carried to the floor of the car on the shoes of those using it. The sanitary wire door mat is designed to prevent this trouble. Just as the house owner places a mat in front of his outside door for guests to wipe their feet on, so is the Sanitary mat used by the motorist for wiping his shoes before he climbs into the car, and the utility of such an article is too obvious to need comment. The Sanitary wire running-board mat is made by the Sanitary Wire Door Mat Co., 413 South Lincoln street, Chicago, Ill. This mat will fit any make of car. It is substantially made of the best galvanized steel wire and it is a perfect remover of snow, water, ice, sand, clay, mud, grit, gravel or any substance that might become attached to the sole of the shoe. This mat will not clog or fill up. In plain galvanized the price is $1.25 or in enamelled rubber finish the price is $1.50. This is a quick seller for any dealer and correspondence is invited by the manufacturer.

Higgins Quality Springs For Replacement.

The Higgins Spring & Axle Co., of Racine, Wisconsin, is making a specialty of supplying automobile springs of every type for repair men. A large stock of springs, spring plates and spring clips are carried in stock and orders, however small, will be given careful attention and quick delivery is guaranteed. This company will send its attractive illustrated catalog containing a large amount of useful information regarding springs, to any of our readers who take the trouble to write for it.



Monograms and Flag Emblems.

A full line of monograms and flag emblems also decalcamania transfer initials and monograms is manufactured by the Auto Monogram Supply Co., Dept. R, Niagara building, Newark, N. J.

All the monograms made by this company are artistic and thoroughly up-to-date and prices are reasonable. This makes a quick selling line for any dealer and correspondence from our readers is invited.

A Combination Hydrometer and Battery Filler.

The Workrite Mfg. Co., Cleveland, O., have recently placed on the market a hydrometer embodying a number of novel features. It is claimed for the Workrite hydrometer that it can be dropped without breaking. This feature is obtained by rubber collars placed at top and bottom of glass which prevents the glass from striking when dropped. The collar at the bottom is made square which permits of laying the hydrometer on an uneven surface and it will not roll off. A small rubber cube placed in bot-

Workrite Hydrometer.

tom of hydrometer acts as a cushion for the float to strike against when forcing acid back into the battery. It also prevents the float from shutting off the hole in bottom of hydrometer.

Perhaps the most striking and important feature of the Workrite lies in the fact that there is no rubber plug in the bottom of hydrometer which is the ordinary construction. As can be seen by the illustration, a rubber tube is attached to the bottom, thus eliminating any chance of this connection coming out and spilling the acid and breaking the float. The instrument sells at $1.00 each, by mail prepaid.

This company also markets a combination battery and filler outfit. It consists of a jar in which the regular hydrometer is kept permanently. The large rubber collar on the hydrometer makes the jar dust and evaporation proof. The jar is filled with distilled water, making a clean and convenient receptacle. After testing the battery the hydrometer is rinsed off into clean water, preventing deterioration of the rubber parts from the acid. The price of this combination outfit is $1.50 by mail prepaid.

The manufacturers of these devices claim that they use best quality of rubber fittings and that the bulb capacity is of unusual size. As the life of a storage battery depends to a great extent upon giving it proper care, motorists should be prepared to test their batteries regularly and keep them well filled

Workrite Combination Outfit.

with distilled water. This is especially true with winter approaching, as a battery will freeze at certain temperatures if it has not sufficient charge. On the jar mentioned above, the label contains full instructions for using the hydrometer in making tests and filling battery.

JOHNSON'S CARBON REMOVER

Cures 80% of Engine Trouble

A dose of Johnson's Carbon Remover—The Engine Laxative—will make your motor run like it did the first 500 miles—quietly and full of "pep"—And your gasoline consumption will drop from 12% to 25%. You will save from $3.00 to $5.00 over any other method.

You Can Take the Hills on High Without a Knock

if you will keep your motor free from carbon with

JOHNSON'S CARBON REMOVER

That knocking in your engine—difficulty you have climbing hills—poor pick-up—pre-ignition and lack of power will all be overcome.

You Can Do It Yourself

For 25c—five minutes' time—and with no labor, you, yourself, can remove all carbon deposits. Pour an ounce of Johnson's Guaranteed Carbon Remover into each cylinder—allow it to remain two to twelve hours, then drive your car 10 or 15 miles. Results will surprise you.

Use It Every 1,000 Miles

If you will use Johnson's Carbon Remover at regular intervals, giving carbon no chance to accumulate, you will eliminate most valve trouble and your engine will always be at its highest efficiency.

If your dealer cannot supply you with Johnson's Carbon Remover, use attached coupon.

Write for our folder "Keeping Your Car Young"—it's free.

$1.00 Special Offer $1.00

S. C. JOHNSON & SON, Dept. AD11, Racine, Wis.

I enclose $1.00 for which please send me by prepaid express enough Johnson's Guaranteed Carbon Remover to thoroughly clean an ordinary four-cylinder motor four times.

JOHNSON'S PREPARED WAX

Now Made in Liquid Form

We are now making Johnson's Prepared Wax in ***Liquid Form*** as well as Paste—so that it may be more easily polished. Johnson's Prepared Wax ***Liquid*** is exactly the same as our Paste Wax except that it is a liquid. Apply with cloth, brush or spray.

Is Your Car Dirty, Grimy and Unsightly?

DO you know that you, yourself, can make it look almost like new and save the cost of revarnishing? All you need is Johnson's Cleaner and Johnson's Prepared Wax ***Liquid.***

JOHNSON'S CLEANER

entirely removes all stains, scum, road-oil, tar and grease from body, hood and fenders. It doesn't injure or scratch the finest varnish—simply cleans and prepares it for the Wax polish.

Absolutely Dust-Proof

Johnson's Prepared Wax Liquid gives a hard, dry, glasslike polish which does not collect or hold the dust. It preserves the varnish and protects it from the weather, adding years to its life and beauty. It covers up mars and scratches —prevents checking and cracking—sheds water and makes a "wash" last twice as long.

Johnson's Prepared Wax Liquid is very easy to use—it polishes instantly with but very little rubbing. You can go over a good sized car in half-an-hour.

Quarts.....**$1.40** **Pints**.....**$ .75**
East of the Rockies

If your dealer cannot furnish you with Johnson's Automobile Products, we will pay the expressage to any point in the United States east of the Rockies.

Gordon "Jack Frost" Radiator and Engine Robe.

The "Jack Frost" Robe made by The J. P. Gordon Co., Columbus, O., is one of the most practical and necessary items of equipment for winter driving. It is so made that the curtain over the front of the radiator may be adjusted to any weather condition and closed entirely when the engine is not running, and when closed it will keep the engine and the water warm for several hours.

To get satisfactory service from a car

Divided Curtain Style for All Cars.

in cold weather it is necessary to keep the radiator well protected. The temperature of the water in the radiator and around the cylinders has much to do with engine efficiency as well as the quantity of gas used to get a mixture rich enough to develop proper power until the engine is thoroughly warmed up. Temperature has much to do also with battery economy, a cold motor is always hard to start and this is a needless drain on the batteries and the best way to overcome the trouble is by fitting a well made radiator and engine robe to the car which will retain the heat and keep the cold air out.

The Gordon "Jack Frost" robe is made in two parts, a jacket with curtain that completely covers the radiator and a robe to cover the hood. It is just as easy to raise the hood with the robe on as without it. Secure and convenient fastenings hold both parts in position so they can not be blown off or worked loose by vibration. The appearance is very neat and pleasing as the robe is carefully made from patterns in which every detail is worked out before robes drafted over them are permitted to leave the factory.

One-Piece Curtain Style for Fords.—Divided Curtains Supplied When Specified.

The materials used are the best obtainable for wear and warmth. The better grade is artificial leather and the cheaper one a special enamelled cloth. Both are lined with heavy heat retaining material.

The Gordon Co. manufacture "Jack Frost" robes in the divided curtain style illustrated for every American made car, also a special one-piece curtain for Ford cars which rolls from the bottom up and thus in no way interferes with cranking the engine.

Schrader Employees Patriotic.

Among the manufacturing concerns in the automobile industry which have distinguished themselves for the wholehearted support extended to the Government in its recent Liberty Loan campaign, the firm of A. Schrader's Son deserves particular mention. Although generous subscribers to the first loan, the employees responded with enthusiasm to the invitation to subscribe again, and when the list closed a total of $365,000 in subscriptions had been pledged. In addition to its money, the firm is also giving of its men. The service flag flying over the entrance of the Atlantic avenue factory shows that 54 employees have answered the call to the colors.

The Dover Electrical Soldering Iron.

In this connection we illustrate a soldering iron manufactured by the Dover Mfg. Co., Dover, O., New York office, 30 Church street. In describing this soldering iron the manufacturers say that the big essential fact about it is that the copper soldering point is connected with that famous and unbelievably perfect heating element which is revolutionizing electric heating practices —the "Vea Heating Element," controlled absolutely and exclusively by this company. The "Vea Heating Element" is a non-conductor of electricity but conducts heat as readily as cast iron. It is made in an electric furnace of approximately a temperature of 5,000 degrees.

Dover Electric Soldering Iron.

The soldering iron itself consists of a flanged copper core running the full length of the heating element. The resistent coils are wound around a thin vitrified clay tube. The "Vea" insulating material is forced in between the vitrified tube and the copper core, and between the coils and the steel casing, under tremendous hydraulic pressure. This absolutely prevents short-circuiting or burning out in the coils, making them indestructible, and gives a full and complete use of all the heat development. The entire heating element is permanently sealed in a steel casing. It is impossible for anyone to injure the iron by ignorant tampering. It should be borne in mind that this iron can be attached to any electric light fixture and will work perfectly. Our readers who have soldering to do should send for a descriptive circular and price list of these soldering irons, which are made in several different sizes. The special advantage in electrical soldering irons is that the heat is continuous as long as it is wanted, and no time is wasted, as in the case of the ordinary way of soldering, waiting for the iron to heat.

A Comprehensive Service Plan.

Simultaneously with the announcement of the opening of six new branches making 22 in all, although it has been in operation only a year, the Bearing Service Co., Detroit, Michigan, has made known the appointment of three traveling representatives who will establish some 450 agencies throughout the country within the next twelve months. The United States, east of the Rockies has been divided into three main sections in charge of the following men respectively: Harold Perkins, T. L. Hutchison and B. H. Boensch. These men started on September 10th from Boston, Kansas City and Detroit to inaugurate the work in the three branches. When they have completed the organization of these territories, they will move on to other branches in their respective sections. The plan is to establish agencies in a number of towns in each branch's territory. This connection will be with some responsible concern who will be fully supplied with all the technical bearing service data and who will represent the company in its immediate locality. The desire of the Bearings Service Co. is to bring its service within reach of every [illegible] dealer and garageman whoever [illegible] be. The 22 branches now in operation the great automobile centers of the try, therefore are being supplied with these agencies which will practically cover the entire country. The work on the Pacific Coast will be in charge of D. B. Bevier, Pacific [illegible] supervisor.

New Incorporation.

The Geo. D. Bailey Co., 1120 Michigan avenue, Chicago, Ill., has been incorporated for $25,000 under the laws of the State of Illinois with the following officers: president, Geo. D. Bailey; vice-president and general manager, C. [illegible] Ferguson; secretary, F. M. Stephen; treasurer, E. H. Ferguson.

The Bailey Co. manufacture the Bailey Ball Thrust Bearing, a bearing made to replace the flat thrust washers used as standard equipment at left (gear) side of the differential on the Ford and Chevrolet 490 cars. The Rayfield Coupling for magneto, generator and pump shafts is another product they are now marketing.

Heretofore, the Ahlberg Bearing Co. have been exclusive distributors of the Bailey products for the United States but now the latter company is to market the product direct through the jobber and dealers although the Ahlberg Co. will still continue to handle the line.

Speedometers Repaired.

The General Speedometer Repair Co., 51 West 63rd street, New York City, makes a specialty of repairing all makes of speedometers, horns and clocks, specializing on the following work: Stewart-Warner, Jones, Hoffecker, Johns-Manville, Sears-Cross, and Standard Speedometers—Klaxon, Newtone, Spurton, Long and Stewart horns. This company also maintains an official service station for the care and repair of the Van Sicklen and the Corbin Flexible speedometers. Careful attention will be paid to all orders and satisfactory work is guaranteed.

The Champion Shock Absorber.

This is a new device especially made for Ford cars which has been placed on the market by the Champion Shock Absorber Sales Co., 918 No. Senate avenue, Dept. K, Indianapolis, Ind. The device is illustrated this month in our advertising columns and if readers will consult the advertisement, they will get a good idea of the appearance and method of applying this shock absorber. Those interested should write for prices and full particulars direct to the manufacturers.

Ford Starts and Brakes Like Big Car

Put a set of Cork Inserts in the Ford transmission and it acts like a different car. That bucking at the start—that lurch into reverse—the shivering and chattering under the brake—which embarass the driver and are hard on the car—all disappear. The Ford goes into low as smooth as you please. A light touch of the toe and braking begins instantly but smoothly. A sudden pressure in the emergency, and the car stops within a few feet, without chattering or rattling.

$3 per set of 3

ADVANCE CORK INSERT

TRANSMISSION LININGS FOR FORDS

op the slipping through the use of buttons of cork—a patented feature other lining can have. Cork never gets hard or polished. It's hard, olished linings that cause all the trouble in ordinary transmission linings. ork Insert Linings don't slip—don't grab. They make the smoothest, fest, most economical linings for the Ford transmission ever devised. ney give a better driving, better braking car, and a lining that outwears dinary linings three to one.

ord Motor Kept Cool—Fan Kept Fanning by Fan Belt That Doesn't Slip

nen the Ford fan belt runs as it ought, the Ford motor is kept cool and overheating is oided. But the fan can't fan properly if the belt is slipping and lays down on the job. e slippage of the ordinary Ford belt runs as high as 25% to 50%.

ADVANCE CORK INSERT

TRADE MARK REG. COPYRIGHTED 1917

FAN BELT FOR FORDS

ps slipping. The buttons of cork, unaffacted by water or oil—grease or dirt—grip at the t turn of the motor and keep the fan fanning. Cork Insert Fan Belts outwear several inary fan belts and do the work better as long as they last.

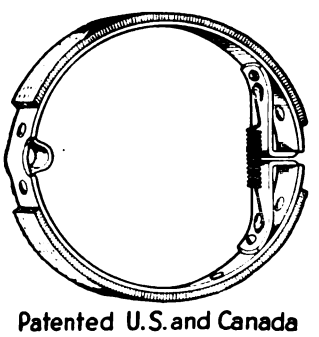
Jiffy Vulcanizer.

A very clever and effective vulcanizing device for the use of manufacturers has been placed on the market by the Vulcanizer Mfg. Co., 131 North Seventh street, Philadelphia, Pa. This vulcanizer is extremely simple in its construction



The Jiffy Vulcanizer.

and it will undoubtedly command a ready sale and take its place in the kit or tool box of thousands of motorists. With this vulcanizer a permanent repair can be made to the inner tube in from three to five minutes. With the machine a chemical wafer is furnished, which has just a sufficient amount of fuel, so that when the wafer is ignited, it will give the correct amount of heat to vulcanize the patch and thoroughly mend the tube in an absolutely satisfactory manner. Many vulcanizers for car owners are designed to use gasoline for fuel, but with this vulcanizer there is no flame, just a steady dependable heat at the right spot and for the right length of time and also at the correct temperature to do the vulcanizing properly. We feel sure that a good many of our readers will be interested in this very convenient device, which retails for only $2.00. It is also a quick seller for dealers, and the manufacturers will be glad to promptly respond to inquiries which may be sent in by our readers.

Perfection Steel Band Brake Shoes.

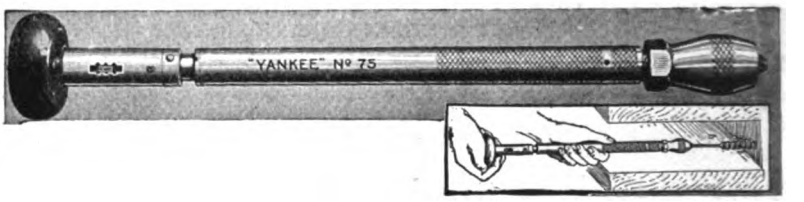
Perfection steel band brake shoes for Ford cars were first put on the market in 1915, a patent covering the device being issued June 6, 1916, to A. P. Worthington, 700 North Main street, Los Angeles, Cal. The shoe is made of ⅛ x 1-inch band steel. The ends of each piece are sheared and formed into ears for

Perfection Steel Band Brake Shoe for Fords.

the hub cam shaft to engage, the ear or brace thus formed is securely riveted to the body of the shoe, steel buckles are cut and formed, and riveted to opposite side of shoe, to receive bolt which holds the brake shoe to housing on axle. The shoes are lined with high grade, long asbestos fibre, woven with copper wire. Each shoe is trued up and fitted to a new brake drum, thus insuring a perfect fit with lining coming in contact with brake drum all the way around. This style of shoe has many advantages over the cast brake shoe. They have more braking surface, cannot be broken in use or in handling, can be relined at any time and a slight pressure of hand brake lever will tightly lock the rear wheels. With this style of shoe the car can be brought to a stop without the clatter and shake. The brake drums will last indefinitely as this style of shoe will not cut or wear away the drum. A very large number of Perfection steel band shoes are in use and are giving perfect satisfaction. The retail price is $2.00 per pair.

"Yankee" Push Brace.

Holding down the repairman's time and thus rendering an economical service to the automobile owner is one of the first considerations for the modern garage or repair shop. It is more essential in the days of high labor costs than ever before. An automobile has many nooks and corners which are inaccessible with ordinary tools, and providing a special tool for each of the many lighter operations, common in repairing, is not practical in the average shop or garage.



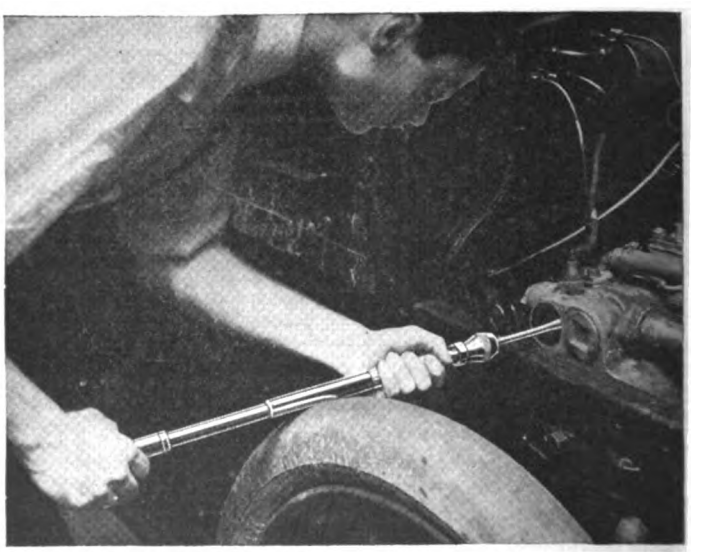
The "Yankee" push brace No. 75, manufactured by North Bros. Mfg. Co., Philadelphia, Pa., has many uses. While it is not adapted to the heavier work done by a breast drill, it is generally superior to the ordinary brace in rapidity and convenience, and by reason that it can be used in cramped places where a brace cannot. It will hold all the tools used in a bit-brace, but is operated by pushing on the handle.

In all light work around an automobile, such as about the dash where room is scarce, for drilling through metal bodies, etc., it is most handy. It is used to tap holes and drive screws, and with a socket wrench in the chuck it is frequently a convenience in tightening bolts and nuts.

The "Yankee" push brace is also achieving popularity among garagemen as a valve-grinding tool, as by use of the plain movement, when the chuck is revolved to the right while the handle is drawn out, and to the left while the handle is pushed in, the reciprocating motion so essential to thorough valve grinding is obtained. A coil spring placed beneath the valve, between the valve head and the valve guide, will facilitate the work. The two-thirds turn desirable in valve grinding can be produced by working the handle only about three inches up and down.

Those who have ground valves by twirling a screw driver between their hands will appreciate the saving of time and labor which the "Yankee" push brace makes possible. Simply pumping the handle completes the job in half the usual time, with a saving of effort and the producing of a better job.

The push brace has four movements—right-hand, left-hand; plain and ratchet.



Yankee Push Brace No. 75.

The ratchet movement is employed for the occasional heavy work that cannot be done readily by the push movement. The spiral rod is of steel, grooved, and with 1½-inch nuts of hard bronze. Working parts are sleeve-protected against grit and dirt. The length of tool without bit, is 16¼ inches when closed, and 23½ inches when extended.

Ideal Hose Clamp.

A large line and reliable hose clamp for garages and dealers is manufactured by the Ideal Clamp Mfg. Co., 203-5 Bradford street, Brooklyn, N. Y. Dealers who are interested should write for prices and particulars in regard to the garage and dealers' assortments manufactured by this company.

Using the Yankee Push Drill for Valve Grinding.

WINTER BUSINESS

COLD WEATHER MADE PROFITABLE

Here is your opportunity to make more profits, and be a leader in the auto accessory business.

Last Winter's sales record already broken. Jobbers and dealers will increase this record many times while cold weather is here.

Presto specialties keep moving and leave liberal margins of profits for you.

Here is the Blue Ribbon Winter Seller of them all.

Note the new Handle and Hook for all Makes of Cars.

Price, $4.00 In CANADA $6.00

The Presto Heater

has two new conveniences. The new swivel hook, that enables you to hang the heater anywhere under the hood. The handle allows you to move it from place to place while still hot.

The Presto Heater operates by connection with the nearest electric light socket. **Eliminates starting difficulties** winter mornings. Better than heating the garage, because the heat is delivered where most needed, under the hood. Consumes but a small amount of current, about 1c. per hour.

The Presto Line includes

DASH LAMPS
INSPECTION LAMPS
ELECTRIC CIGAR LIGHTERS
SWITCHES
CONNECTORS, Etc.

Sold by all leading jobbers and dealers everywhere.

Write for complete cataleg of over 100 real live accessories.

Tuthill Titanic Lubricated Springs

Motorists know that the "Service Sign" pictured above means break-proof springs and 'top notch' spring service. They look for it on the dealer's window—it *brings* and *builds* business.

More spring replacements are made with Tuthill Titanics than all other makes put together.

Tuthill dealers are not required to carry heavy stocks of springs. Our distributors located at convenient points in every part of the United States carry *complete stocks* ready for immediate shipment.

Our proposition to dealers will interest you — write for it and name of nearest distributor. Ask for this business building sign and our poster price list.

F-F BATTERY BOOSTER

MAGNETIC RECTIFIER
Patented April, 1916

For Public or Private Use

On a frosty morning your battery feels sluggish, more time is required to start your engine, everything is cold and your battery suffers immeasurably if not kept right up to its proper efficiency. Fall and winter seasons make our "Battery Booster" of more importance to you than at any other time. Neglecting to keep the battery in your car fully charged is like losing dollars thru a hole in your pocket. Charges battery at night while in the car from an alternating current lamp socket.

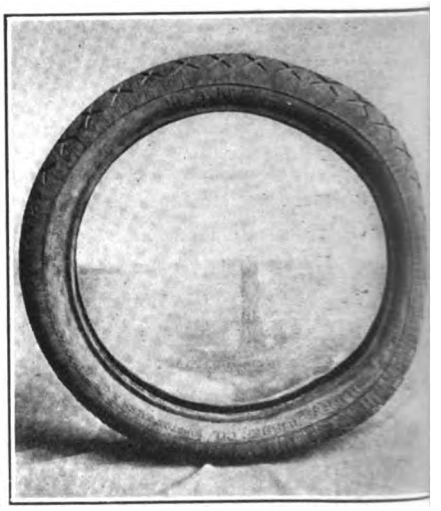
New Plant of Hartford Machine Screw Co.

Large additions to the extensive plant of the Hartford Machine Screw Co., Hartford, Conn., have recently been completed. This plant now comprises over 200,000 square feet of floor space. Its exceptionally complete facilities cover the production of all varieties of turned metal parts, milled from the solid bar, ranging in size from 1-64-inch to six inches outside diameter. Besides screw machine products of every description, the Hartford Machine Screw Co. manufactures the well known Master spark plugs with calorite insulators; also Master power driven tire pumps.



New Selling Plan for Dayton Rubber Co.

R. L. DeVoe, general sales manager of The Dayton Rubber Mfg. Co., has just given out a statement of the selling campaign for the 1918 season. The company has made rapid strides during the past year, working three shifts in the factory, and running 24 hours a day. Sales for the first six months of 1917 were greater than the total of 1916. The new plant which will more than double their capacity will be ready for occupancy by the middle of October. The company has been gradually supplementing its sales force and with the opening of three new branches next month, will employ 50 or more additional salesmen for the coming season. Other branches in principal cities will also be opened. The sales plan of the company is of very great interest to all dealers on account of the unusual advertising and selling co-operation which is offered. The pneumatic tire, which is known as the "Dayton Thoroughbred," is put out on quality basis backed with a sales and advertising campaign that will assure a dealer of a rapid turnover. The few hundred dealers who have been handling Dayton airless tires will welcome the announcement of a vast increase in the production of Ford sizes. A very extensive national advertising campaign has been outlined which will cover all national periodical, farm papers and large list of trade papers. The extensions that have been made places the Dayton Rubber Mfg. Co. as one of the few largest tire concerns in the country. On October 1st the company will pay its regular quarterly dividend at 7 per cent. per annum on the preferred stock.

A New Tire on the Market.

The Hanes Rubber Co., with a capital stock of $500,000, has been organized at Winston-Salem, N. C., to manufacture automobile tires and tubes. All the stock is held by two men. Two years have been spent in constructing the plant and purchasing the equipment. A scientific study was undertaken to ensure a plant to produce good tires as economically as possible. The first tire was turned out in August.

The Hanes company is making the Hanes plain tread, "Ground Gripper"

Hanes Automobile Tire.

non-skid tread, red tubes and gray tubes. A cord tire will be added to the line when the formula has been worked out to the satisfaction of the company.

The present equipment allows an output of 300 tires per day, but this capacity will be doubled when equipment now ordered is installed. The tires are made by the single cure, wrapped tread process.

The officers and owners of the company are: A. S. Hanes, for 11 years the head of the Hanes Hosiery Mills, and John W. Hanes, formerly with the American Tobacco Co. and the Delion Tire Co., of Trenton. Chris Miller, who has been with Dunlop in England and Continental in Germany, is general factory manager.

This represents the first effort on a large scale to establish a tire plant in the South, which many regard as a favorable location because of its proximity to the cotton fabric district. The Hanes are old hands in manufacturing and the progress of the company will be watched with interest in the trade. A heavy advertising effort will be used as a part of the selling plan.

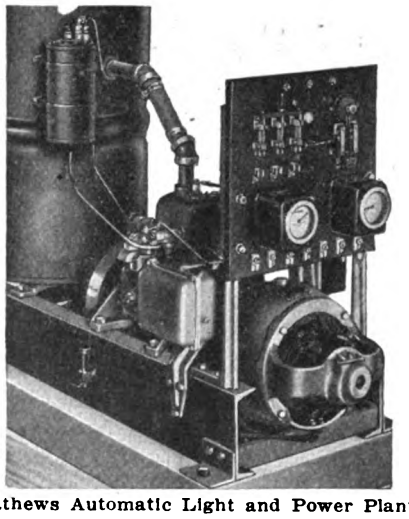
A Clever Window Display and Counter Stand.

We illustrate a new and very attractive window display and counter stand which has been brought out by the Atlas Auto Supply Co., 656-660 West Austin avenue, Chicago, Ill., for dealers in "Tire-Doh."

The window display size of this design stands 27 inches high by 42 inches wide and is beautifully lithographed in five colors. It shows on the left a badly torn inner tube, which tube is shown on the right after being repaired with Tire-Doh, inflated and ready for the road.

The copy is carefully prepared to show the reader the ease and speed with which Tire-Doh can be used to repair all kinds of tears, cuts, punctures, rips and holes in rubber goods, particularly inner tubes and casings.

Excellence of finish and durability of construction will make it possible for this display to stand up and do its duty



A Window Display and Counter Stand for Dealers.

as long as it is used wherever a Tire-Doh window is desired.

The counter size of this display, which is an exact reproduction of the large design for windows, will stand seven inches high by approximately 11 inches wide and in the center will have an opening cut out for the insertion of an individual can of junior size Tire-Doh outfit retailing for 50 cents. Dealers interested in obtaining one or both of these displays should write direct to the Atlas Auto Supply Co.

Matthews Automobile Light and Power Plant.

For several years, the Matthews Electric Light & Power Plants, both the standard and marine types, have been well known particularly on the Atlantic

Mathews Automatic Light and Power Plant.

coast, and now a most healthy growth has forced a factory development of a uniform type, and a rapid expansion into the hitherto undeveloped territory of the Middle West.

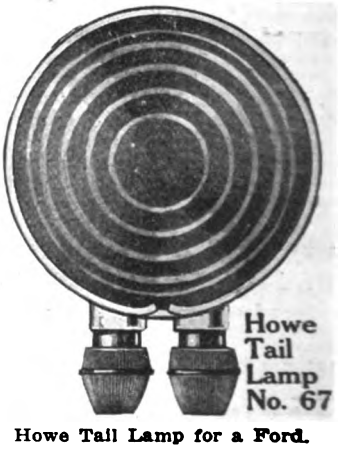
The Consolidated Utilities Corp., Chicago, Ill. (national distributors), announce that either type of plant fully automatic or semi-automatic is now available in either 1, 2 or 5 K. W. capacity. The automatic plant has more than four years successful operation. This plant not only stops automatically but is self-starting, whenever the batteries have been discharged 15 per cent. of their capacity or whenever the load, or current demand, is in excess of that which the battery should furnish.

It will readily be seen that a plant of this type will protect the battery against its two greatest enemies, overdischarged or remaining discharged. Moreover, it is a great blessing to the user, because he doesn't have to keep the batteries "on his mind."

The new sales campaign, which is broad and complete, provides real dealer co-operation and territory organization along intensive and aggressive lines, insuring to the large dealer his share in the enormous growth of the farm lighting business.

Laurel Motors Corp. to Build New Factory.

The Laurel Motors Corp., which has taken over the Laurel Motor Car Co., has purchased a factory site in Anderson, Ind., and will erect a modern plant for the manufacture of Laurel cars and trucks, and expect to be operating the new plant about January first. The Laurel Motor Car Co. has been manufacturing cars in Richmond, Ind., for the past two years and there has been a great demand for their car. The new plant will enable the company to have a large production and take care of agents and territory with whom contracts previously could not be made on account of insufficient facilities to turn out cars. The company will use a new 16-valve engine designed by Robert M. Roof of Anderson, Ind., whose 16-valve head for Ford cars has attracted wide attention. The new model for 1918 will have 116-inch wheel base and all the popular types of bodies will be furnished. Pending the completion of the new plant the Laurel will be produced in temporary quarters at Anderson. It is estimated that the production for 1918 will be from three thousand to five thousand cars. The price has not yet been publicly announced but it is reported the pleasure car will be in the $1,000 class.



New District Representatives for Diamond T. Truck.

At the annual sales conference of the Diamond T Motor Car Co., the following men were appointed district representatives: Frank S. Hyman, formerly with the Packard Motor Car Co., will assist dealers in Michigan, Ohio and Kentucky. Headquarters will be in Cleveland, O. E. T. Strickland, formerly manager of the Kansas City branch of the U. S. Tire Co., will cover Kansas, Oklahoma, New Mexico and Texas. Headquarters will be in Kansas City, Mo. Louis E. Wagner, formerly with Baker Motor Vehicle Co., will be general representative for the territory including North Carolina, South Carolina, Florida, Georgia, Mississippi, Alabama, Louisiana and Tennessee. Headquarters will be in Atlanta, Ga. R. A. Breeden, formerly general representative for the Diamond T, will devote his exclusive attention to Northern Illinois, Wisconsin, Minnesota, Iowa, North Dakota, South Dakota, Colorado and Nebraska. He will make his headquarters in Minneapolis, Minn. Joseph S. Conroy will continue to act as district manager for the Chicago territory.

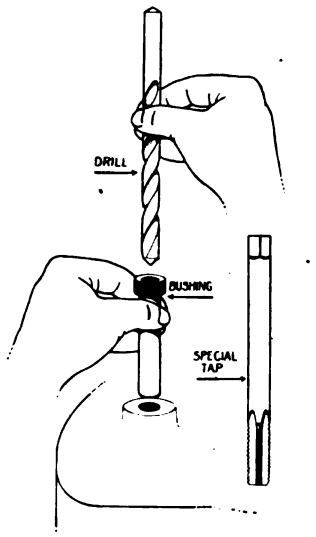
Howe Manufacturing Company Marketing Tail Lamps.

The Howe Mfg. Co., Chicago, Ill., makers of the well-known Howe spotlight, have announced to the trade a complete line of tail lamps. Their introductory announcement to the trade in a circular, contained this description:

"All Howe tail lamps are equipped with National Mazda 6-volt, 2 candle

Howe Tail Lamp for a Ford.

power bulbs, double contact unless otherwise specified. Each lamp is packed in high grade, individual, labelled carton. The lenses are genuine ruby semaphore. The finish is high grade black enamel."



The tail lamp illustrated is made espe-

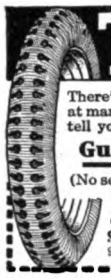
Digitized by Google

cially for Ford cars and has 2 bulbs and 2 plugs. The one bulb is an 18-volt taking its current directly from magneto when the engine is running. The other bulb is 3-volt connected to two dry cells. When the engine is running, current is supplied by the magneto. When the engine is idle, a throw of the switch to the dry cells continues the light. The same care and quality goes into the production of Howe tail lamps as is used in the manufacture of Howe spotlights. Very attractive prices are being made, the circular says, due to the large volume of lamps produced by this concern.

The Handy Tap and Drill Set.

Every man who has overhauled a Ford car knows that drilling sheared-off bolts in the cylinder blocks is usually a ticklish and mean job, but with the Stevens tap and drill set illustrated herewith absolute accuracy is assured. Guessing as to the center of the bolt is eliminated by a special bushing which absolutely does the trick. This bushing fits snugly into the hole and unerringly guides the drill through the exact center of the

Showing Use of Stevens Tap and Drill Set.



bolt. The tap is thus enabled to dislodge deftly every particle of the broken bolt thread, leaving the hole absolutely clear for a new bolt of the original size. This special bushing feature is included in every set and the tap and drill set is put up in a neat wooden box, at a retail list price of $1.00. This is a quick selling device for any dealer. Readers who are interested should write direct to Stevens & Co., 375 Broadway, New York City.

MECHANICAL DRAWING.

HALLADAY BUMPERS

The New Multiple Spring Bar

The latest and greatest improvement in bumper construction.

An absolutely new bar construction, comprising a heavy spring steel front bar joined to two supporting bars by means of flexible connections that eliminate breakage.

The final shock-absorbing qualities are attained through heavy buffer springs between the main and support bars.

The result is a bumper with no weak spots, but with the greatest resilience and shock-absorbing qualities ever attained in bumper construction.

We furnish this bar with the fittings shown in the illustration or with any of the Halladay fittings.

HERE IS A WINNER FOR LIVE DEALERS

The experienced car owner instantly recognizes its mechanical qualities and efficiency, and everyone appreciates its thorobred lines and beautiful finish

Get busy now and get the business of your vicinity; write your jobber or the nearest distributor.

FIRESTONE CEMENTLESS TUBE PATCHES

"Tug O' War"

DEALERS, have your customers make this test. Stick two Firestone Cementless Tube Patches together. Let your customer hold one. You hold the other. Then for the Tug o'War.

Throw your entire weight into it. Pull! Tell your customer to do his best. The patches will hold fast. You can't pull them apart.

You'll be surprised how this Tug o'War test will convince motorists. They know about these Cementless Tube Patches but they like to be "shown."

There's no better way than the Tug o'War test to prove the strength and gripping power of these patches.

At the time you make the test call the motorist's attention to the hand-buffed feather-edged finish. No puckering or creeping.

Tell your customers about all the Firestone Accessories. All you need do is to introduce them. Repeat business grows rapidly. Remember our selling co-operation is always at your service.

FIRESTONE TIRE AND RUBBER COMPANY

The Haywood Tire Repair Shop of Paul R. Fredricks, Wallingford, Conn. Now doing an average business of $450 a week.

You Too, Can Make Big Money.

We need immediately more men like Paul R. Fredricks, to manage Haywood Tire Repair Stations. "Just a year in the business and now doing $400 to $450 a week at a good round profit" tells the story of this ambitious young man's rapid rise to fortune. Scores of men like Fredricks have found their independence in the Tire Repair business, have opened Haywood shops and are making big money. The coupon below or a postcard with your name and address will tell you how to start. Send today.

Tire Repairing Revolutionized.

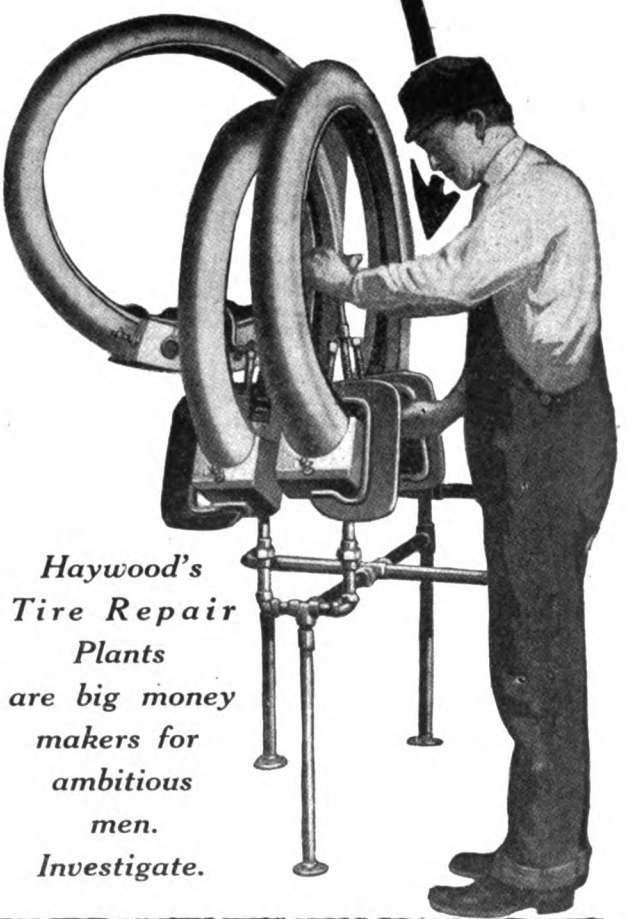
Motorists to Save Millions in Tire Expense.

The Haywood method of tire-repairing is different—**Scientific.** It strikes a new chord in tire economy. It is efficient—saves tires—increases mileage—**lasts.** It has required years of experience to develop it. Practical tests have proven it. Its superiority is acknowledged—accepted by those who know, as a **Triumph.**

30 Million Tires to Repair.

The demand for tire repairing is now so great that more Haywood stations must be established at once throughout the country. We want capable, energetic, ambitious men in charge of each—men who are dependable—competent. **You can have this opportunity**—share in the Haywood success—become a link in a mammoth chain of a country-wide, thoroughly efficient Tire Repair Service.

Make $3000 a Year



You Own Your Own Business!
Keep Your Own Profits!

Haywood equipment is sold outright. We teach you Haywood Scientific Tire Repairing in our Laboratory especially equipped for this purpose. Here you learn all about tires—the inner mechanism of construction—how to repair **scientifically** every tire injury. This training is thorough—practical—and equips you to give Haywood Service of the standard we advertise nationally and are so careful to maintain—the Service that saves motorists millions of dollars in tire upkeep.

A Wonderful Opportuniiy.

The coupon—your name and address, brings full particulars. How to start. How to tie up with the Haywood Service. We'll give inside facts and figures about costs and profits. Explain in detail our Co-operative Business Building Plans. Write today without fail. Learn how you can start at once.

"Grip Like a Mud Hook—Ride Like a Bare Tire"

900 Pages instead of 824 **1918—SIXTH EDITION** 3362 Illustrations instead of 2000

STILL $3.32 prepaid **Dyke's Auto Encyclopedia.** STILL $3.32 prepaid

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 **Instructions**—Simplified and practical.

3362 **Illustrations**—the kind you understand at a glance.

2 **Supplements**, parts printed in colors, treating on the construction operation, repairing and adjusting of the **FORD and PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc.

775 Illustrations and 279 pages on **Electric Ignition, Electric Starters and Generators**, etc.

51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on **Repairing.** Oxy-Acetylene Welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 186 illustrations on **Tires and Tire Repairing.**

44 pages and 119 illustrations on **Carburetion.**

83 pages and 291 illustrations on **Engine and Parts.**

16 pages on **Digest of Troubles.**

6000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index** begins on **colored** paper, easy to refer to.

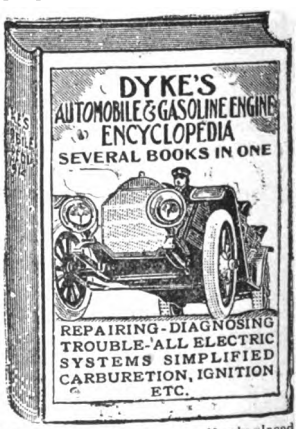
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

You must see this SIXTH Edition in order to appreciate just how complete a book it really is—Order N-O-W.

Price—Although a much larger and better book the price for the present remains **$3.00** (or **$3.28** prepaid, express).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

Make Big Money on your "tow-in" jobs with a WEAVER Auto Ambulance for crippled cars

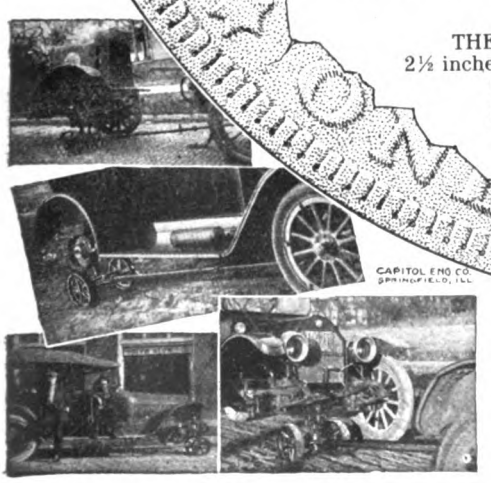
WRITE FOR COMPLETE CATALOG

AT "one dollar per mile", or whatever YOUR basis of charge may be for tow-in services, the Weaver Auto Ambulance will pay for itself in a few trips.

It enables one man to run out and tow in a crippled car in one-fifth the time it would ordinarily require two or three men to do the same work with the improvised methods usually employed.

The strong, rugged construction and the high, broad wheels equipped with roller bearings, make it possible to tow cars over country roads at a rate of 15 to 20 miles per hour. The secure clamping construction eliminates all chance of accident.

A "One-Man" Equipment



Though amply strong, this Ambulance is sufficiently compact and light to enable one man to handle it with ease. When under the front axle, the tongue does the guiding—so it is not necessary to have an operator in the rear car.

For Front or Rear Axle

The Weaver Ambulance is the product of a careful study of the conditions to be contended with in this kind of service. It will attach to either front or rear axle and has a wide range of adjustment to adapt it to any car.

Construction

THE TELESCOPING STEEL TONGUE is adjustable every 2½ inches from 6½ to 11 feet. The axle is 1¼ inches in diameter and extends entirely through the frame, giving ample support for the heaviest loads. The wheels are cast steel, 14 in. in diameter.

You Can't Break These Cast Steel Wheels

One of our favorite demonstrations is to have a customer try to break a wheel with a ten pound sledge.

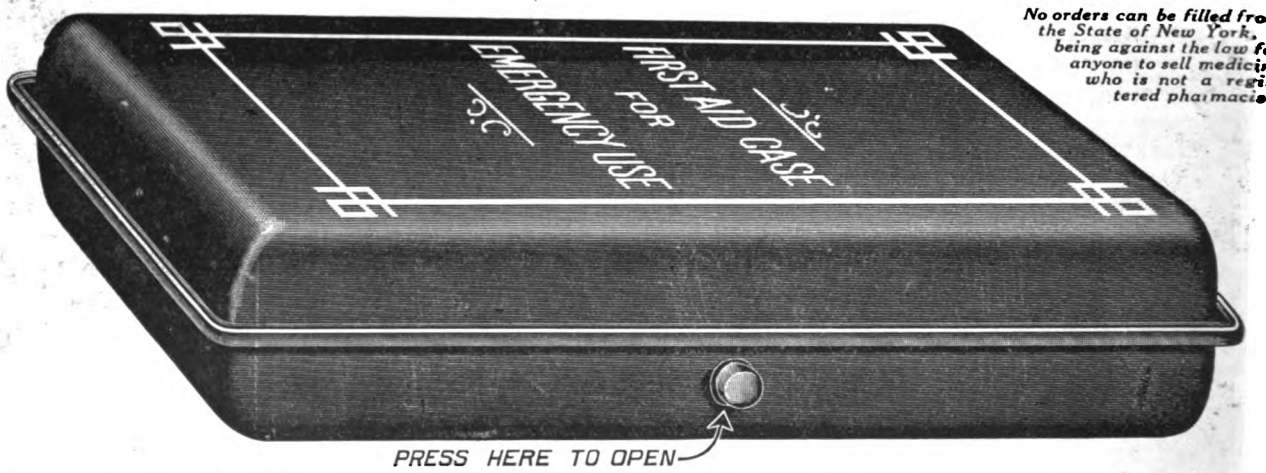
Complete repair sets for standard Pumps. *Order Thru Jobber.*



STEVENS & COMPANY, 375 Broadway, New York

STEVENS NEW YORK

IT MAY BE YOUR TURN NEXT
TO MEET WITH AN ACCIDENT ON THE ROAD.

It may also be a case of life and death to have the materials at hand for prompt treatment. We have recently made arrangements for a First Aid Case for emergencies especially for the readers of the AUTOMOBILE DEALER AND REPAIRER.

No orders can be filled from the State of New York, it being against the law for anyone to sell medicine who is not a registered pharmacist.

This case is made of heavy Bessemer Steel, size 11⅛x5⅛ and 2¼ inches deep, finished in Black Baked Japan and fitted with a strong instantaneous snap. It is strong enough to resist injury to the contents through accident or dampness.

The contents have been carefully selected to supply the needs in an emergency, before the doctor comes. All gauze, bandages and cotton have been prepared in aseptic laboratories under the same rigid inspection as those supplied to the United States Army and Navy.

The contents of this case consists of:—1 "First Aid to the Injured" Instructions. 1 Yard plain Sterilized Gauze for dressing large wounds. 10 Yards 2-inch Sterilized Gauze Bandages for dressing cuts and bruises. 10 Yards 2½-inch Sterilized Guaze Bandages for dressing cuts and bruises. 1 Package Sterilized Absorbent Cotton for pads and dressings. 1 Box Carbolic Salve for burns, sores, insect bites, etc. 1 Yard 1 inch Zinc Oxide Adhesive Plaster for retaining dressings and covering small wounds. ½ Ounce Tincture of Iodine, an antiseptic for immediate use on all wounds and abrasions. ¼ Ounce Spirits of Ammonia for use in case of shock, heart failure and faintness. ½ Dozen Safety Pins.

The retail price of this outfit is $2.50. We have made an arrangement with the manufacturers of such a liberal character that we can supply this outfit with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year, for the low rate of $2.50.

In case you have already subscribed for this year, we will send you one of these outfits, postage prepaid, on receipt of $1.50, which may be remitted by check, money order, or in any convenient way.

Every subscriber to the AUTOMOBILE DEALER AND REPAIRER should have one of these outfits. It may mean the saving of your own life or the life of some friend. *ORDER AT ONCE AND THEN YOU WON'T FORGET ABOUT IT.*

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

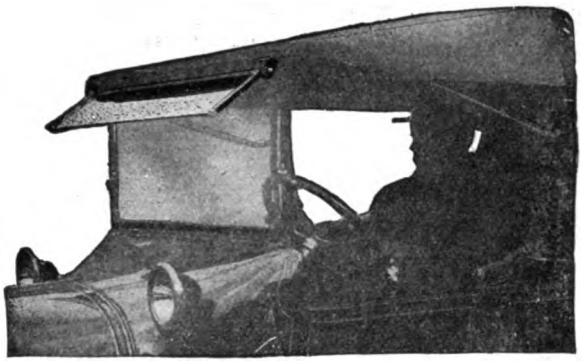
Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.



All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

Temme

SPRINGS FOR ALL CARS

DO all the lame cars drive to *your* door for Temme Springs and other things?

In most good towns, Temme Springs and Temme's Triple Action Service are known to be *as good as gold.*

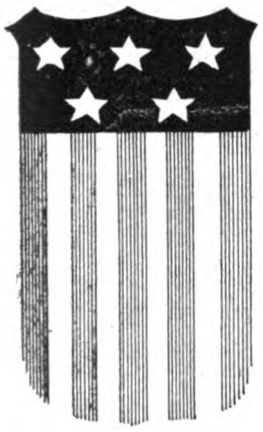
Hundreds of repairers, who have "banked" on Temme and never lost, are putting up Temme highway signs today.

These signs *will* bring in business. Temme has tried them, so he *knows.* And now he offers *you* what won for him.

Temme Springs *"for all cars"* means just what it says—for all cars *since 1902.* Test us by naming the spring you need. Temme Triple Action Service will have it on the way to you the same day.

"For all cars" means *designed* for all cars to factory specifications. And so good are Temme Springs—so prompt the service—so fair the prices—that dealers in *all* cars now buy from Temme *in preference* to the car maker.

You need these springs, this service, these signs. They will make you money, bring new business, help you build the good reputation you are after.



If you delay you may lose this exclusive proposition. Write or wire us now, saying: "Send Temme Spring Service Station proposition at once."

JOHNSON Shock Absorber

This is to remind you of the new model of the famous Johnson Shock Absorber—made by us. The only cure for a hard riding car is a pair of Johnsons. Temme Spring Service Stations make good money on them. Write now for our new proposition.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

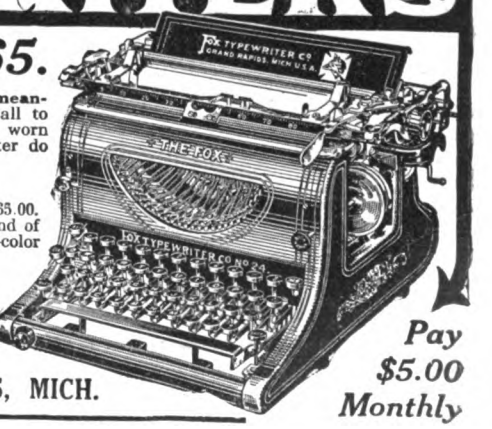
FOX TYPEWRITERS

Factory Rebuilt Like New at $65.



THE LIGHT RUNNING FOX TYPEWRITER

The word "rebuilt" has been abused and misused until it has become a meaningless trade term. When we rebuild a Fox Typewriter we take it all to pieces, re-nickel the nickel parts, re-enamel the frame and replace all worn parts with new ones. The same men who originally built the typewriter do this rebuilding **and do the work just as good.**

50% NEW PARTS AND 3 YEARS GUARANTEE

We offer a rebuilt Fox Typewriter, Model No. 24—*just like new*—for $65.00. These have standard carriages taking paper 10½ inches wide, any kind of keyboard, any kind of type, rubber covers, tabulators, back spacers, two-color ribbons, and are complete with instruction books and cleaning outfits.

Send us any amount you can spare, **from $1.00 up,** as a first payment, and pay the balance $5.00 monthly. Or, send $61.75 all cash. If $10.00 or more is sent with order we will include Free our $4.50 Solid Oak Typewriter Table. Transportation must be paid by the purchaser.

Please order direct from this offer, mentioning Automobile Dealer and Repairer for January. State price you wish to pay and enclose any amount of cash you can spare.

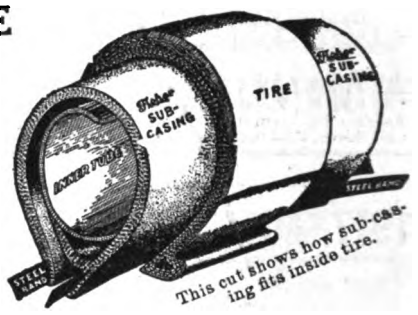
THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.



A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

FISHER MANUFACTURING CO.

1706 PAYNE AVENUE, :: :: CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.

"IDEAL" Lawnmower Grinder

Grinds all makes of mowers perfectly in 15 minutes, without removing reel knives. Best money maker you can have in your shop. Nearly 10,000 in use. Write for Catalog and Price

THE FIRST 2 BOOKS OF THEIR KIND IN THE WORLD

A Complete Automobile Business Education for $3.50

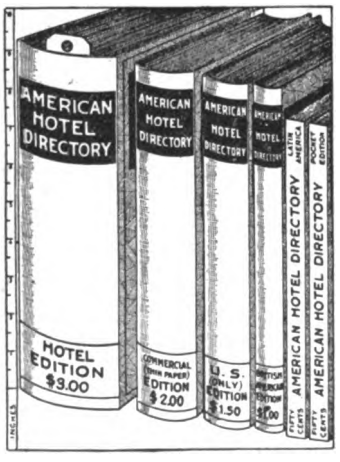
AUTOMOBILE BUSINESS

By J. H. NEWMARK

The first book in the world that discusses the automobile business from a money making standpoint. Every feature of it is thoroughly discussed from a dealer's view—opportunities that the industry presents today; best auto selling territories; organization; sales; advertising; promotion work; garage; service; accounting systems; and all other departments. 201 pages. Price $2.00 postpaid.

AUTOMOBILE SALESMANSHIP

By J. H. NEWMARK



A complete manual for the man desiring to sell automobiles; how a self propelled vehicle operates; simple definitions a salesman should know; manufacturing procedure in motor car factories—essentials of successful salesmanship; how to secure prospects; selling a car; steps necessary; what constitutes beauty, style, comfort, easy riding, convenience, power, flexibility; economy, durability, safety; how to interest prospects; demonstrations; securing order; woman in the case; trading problem; electric vehicles; trucks; etc. 121 pages. Price $1.50 postpaid.

Address all orders for the above books to

THE MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, New York.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the Pocket Edition at 50 cents, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

Detroit Kerosene Equipment attached to Ford Engine showing the entire installation except the Gasoline tank located under floor board.

Use Kerosene

(Coal Oil)

One mile on Kerosene costs less than ½ cent.

One mile on Gasoline costs from 1¼ to 1½ cent.

Buy a Detroit Kerosene Equipment For Fords

Save 60%

Price of Equipment *(F. O. B. Detroit)* **$22**

30 Days Trial or MONEY BACK

Act Promptly

These are days of strict economy.

The Kerosene Equipment ready to be attached to Ford engine consists of:

1. The Detroit Kerosene Carburetor (patent pending) with only one float chamber (for kerosene); the three way valve admits the gasoline for starting.

   Is non-adjustable—throttles down smoothly—idles without loading—increases mileage—is a positive fuel and money-saver—makes no condensation in cylinders and—reduces speed changing.
2. Intake Manifold with drying chamber.
3. Flexible tubings.
4. Gasoline tank, tube and couplings.

INSTALLATION

1. Drill a ⅞-inch hole into center of exhaust manifold.
2. Remove intake manifold.
3. Clamp on new manifold.

DETROIT KEROSENE CARBURETOR CO., Department 66, Kresge Building **Detroit, Mich.**

A Good Sign

IT is always a good sign when you see the Texaco Star in front of a garage or supply shop. It is a sign that you have found the proper place for a supply of gasoline or motor oil.

These two Texaco products have made driving a pleasure for thousands of motorists. Let them do the same for you.

TEXACO MOTOR OIL

has no superior among automobile lubricants. The most painstaking methods of refining applied to a crude oil, the inherent qualities of which are unusually high, produce a lubricant that meets satisfactorily every demand which can be put upon it.

Texaco Motor Oil reduces friction to a minimum thereby enabling your motor to operate at its highest efficiency. It gives a perfect seal between piston and cylinder and allows no gasoline to leak into the crank case. Due to certain basic qualities it *cannot* deposit a hard carbon crust in the motor. If through the feeding of too much oil to the motor any carbon residue should be left it will be in the form of a soft, fine soot that can do no harm and is easily wiped off.

Texaco Motor Oil may be obtained at most good garages. The safest way, the best way, to buy is in one or five gallon cans.

Conserve Efficiency
Give New Life to Motors

Peerless Piston Rings

Conserve efficiency by keeping the motor compression tight and carbon proof. They are ECCENTRIC, the only type that years of compression practice has proven to be mechanically correct. Superior workmanship and the patented lock joint make the PEERLESS piston rings an investment that pays interest on every mile of rough going. They put new life into old motors, making them as effective as the day they were built.

During The Winter Months

On the steep grades, over roads sticky and heavy with mud and snow, everything contributing to hold the car back—that's when the car needs every ounce of energy the motor can develop. The car will make good if the engine is given a fair chance. Peerless piston rings will give every cylinder a square deal, keeping compression where it is needed and making combustion clean and effective.

We have good territory open for live agents.

Dealers:

Our money back proposition clinches sales—We make good—So do the rings. Liberal terms—Fast Sales—Will you have details?

Prest-O-Lite STORAGE BATTERY

Not only a better battery but

Digitized by Google

Perfected Process Plates

QUICKER starts—longer life—greater staying power—the all-important standards of value to you in any storage battery—depend first of all on the plates, the real basis of the chemical action which creates electricity for starting, lighting and ignition.

In the great, modern Prest-O-Lite factories, experts have devised many new and efficient processes to insure you a better battery, and one of their greatest triumphs is the Perfected Process Plate—a distinct departure from previous plate-making practice—an established feature of all Prest-O-Lite Batteries.

Years of effort, research and expenditure stand back of this process.

The active, pasted material is seasoned by a new and different treatment which produces a super-hard center or "back-bone" of gradually increasing porosity as the surface is reached.

The super-hard center provides all the strength, stability and long life of the so-called "hard plate," but without the sacrifice of "pep" and power which is characteristic of all "hard plate" batteries.

The porous, super-sensitive surface, growing from the hard "back bone" or center, provides all the "pep" and power of the so-called "soft plate," but without the sacrifice of long life which is characteristic of all "soft plate" batteries.

In short, the two most desired extremes in storage battery performance—hitherto believed impossible of accomplishment—are provided by the process developed by Prest-O-Lite.

No other battery plates were ever made by this process.

The actual proof to you that "Prest-O-Lite" is a better battery is not only in this and many instances of better making, but in its remarkable records in service.

Manufacturers of representative cars in every class have adopted the Prest-O-Lite Battery as standard equipment. After close observation they have discovered a notable freedom from battery troubles among more than a half million users.

You can eliminate most of your battery troubles by getting a Prest-O-Lite Battery—the battery with the Perfected Process Plates. There is a correct size to fit your car. It will give you the utmost in satisfactory starting, lighting and ignition service.

No matter what make of car you own—no matter what make of battery you have—Prest-O-Lite Service is always ready to help you in the prevention of storage battery troubles. We will gladly test your battery, add distilled water and give you unbiased advice as to its care.

Prest-O-Lite Service Stations everywhere have service batteries for you to use when your battery needs repair. The Prest-O-Lite Service creed begins and ends with the words—"Satisfy the Owner."

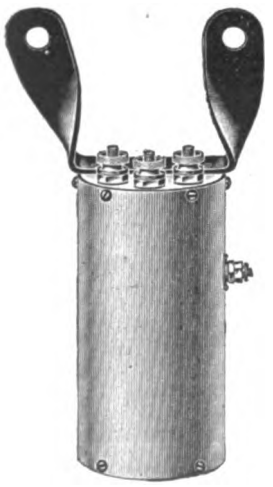
What You Have Always Longed For Is At Last Accomplished

NEW YORK Vibrator-Les Coil IGNITION FOR FORDS

Uses One Powerful Transformer Coil—



entirely devoid of Vibrators, which in connection with our new Distributor takes current from the regular Ford Magneto, giving you for the first time since the advent of the Ford car, an opportunity to equip with the same efficient, simplified single unit, non-vibrating Coil Ignition used on all modern, present day cars, with the still further advantage that no storage or dry cell battery is required.

The present bulky coil box is discarded and panel containing switch is fitted in its place—giving a "clean" dash, and much additional room.

We supply Coil, Distributor (containing our new circuit breaking mechanism) elevating gear bracket, wires, cables, and full instructions—no drilling or tapping is required to install.

Vibrator-Les Coil Ignition

enables car to be driven through dense traffic at a snail's pace, and instantly accelerates with a smoothness and power you never believed possible.

Entire absence of sticking contact points, vibrator adjustments, coil replacements and all ignition trouble, together with easy, certain starting, are but a few of its advantages.

Full details given in our booklet.

Price complete as described— $20.00

Sold with a money back guarantee

They sell because they serve

Racing drivers in a single race often give spark plugs harder service than the average car owner gives his plugs in years of driving.

Rajah Spark Plugs have always equipped the majority of winners in all American races.

For exactly the same reason, Rajah Plugs have always given the longest service in all American cars.

Rajah Spark Plugs sell well because they serve even better than they sell.

RAJAH *SPARK PLUGS*

RAJAH TERMINALS AND ADAPTERS

Power Reviving for Winter Driving

Living Up To an Opportunity

Never did winter business look better for garage and repair men. War times have kept many owners from trading in for new cars. They intend making their old ones do over the winter.

There's your opportunity to get those cars in for overhauling and re-equipment with accessories. They need most to have their old motors put in good shape to make up power shortage and cut down waste of fuel and oil with

McQUAY-NORRIS LEAK-PROOF PISTON RINGS

You know them and why they lead the piston ring field as power producers. Their wonderful gas-tight quality that comes from equal-balanced tension, accurate fit and finish. Their strength and durability with minimum wear on cylinders.

Immediate Service on Any Size Ring

Standard or over-sizes—any width or diameter—for any make or model of motor. Over 300 jobbing and supply houses carry complete service stocks. Over 2,000 different sizes kept constantly in stock at the factory, ready for immediate shipment anywhere.

No other piston ring manufacturer gives such prompt and complete service. It means quick and satisfactory installations, and helps you handle the greatest number of jobs through your shop.

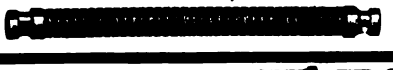
Welded---FLEXIBLE---Permanent



---and it's METAL lined!

The unequaled service qualities of "Triplexd" gasoline hose are due to its three part construction (Metal, Rubber and Loom-Woven Fabric) welded into a unit of strength and compactness thru vulcanization.

Because "Triplexd" can withstand weather, wear and hard usage—because it is strong, flexible and leakproof—48% of the gasoline pump mauufacturers have standardized it and over 60% of the oil companies have adopted it as the most permanent equipment obtainable.

Specify "Triplexd" when you order gasoline hose.

You grip it just once to drive a screw

With an ordinary "driver" you must "grip and let go" the handle a couple of dozen times, or more, when driving or drawing a screw.

With this "Yankee" Ratchet Screw-driver No. 10 you grip the handle once—then just turn your wrist to and fro till the screw is home. Not only a great saving of time but a big saving of muscular effort. Prevents tiring and cramping of muscles of hand and forearm. The Ratchet movement between handle and blade takes all the hard work out of screw-driving and lets a man "speed up" mightily.

"YANKEE" Ratchet Screw-driver No. 10

Ratchet Shifter works lengthwise of blade, adjusts blades for right- and left-hand movement and rigid position. In "Yankee" Ratchet Screw-driver No 11 shifter moves crossways of tool.

PRICES

Eight lengths of blade

2 inch.....	$0.45	6 inch.....	$0.80

No Back Pressure With the Petry

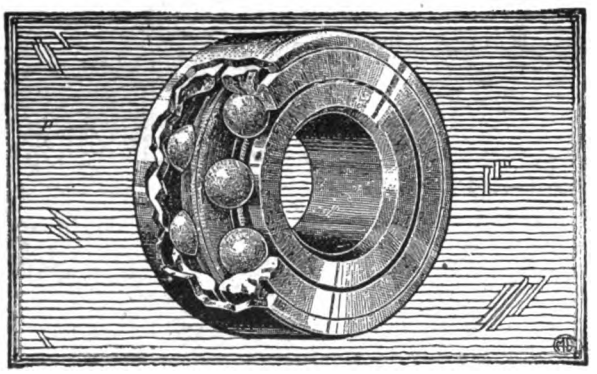
Inside dimensions of the cut-out at every point are larger than this inside dimension of the exhaust pipe, and no air pockets can be formed that might cause back pressure.

PATENTED

SIZES, 1½" to 3¼"
PRICES, $4.00 to $6.00

The Petry Cut-Out is quickly and easily installed, having eight points of adjustment—and once applied, its position is permanent.

Gas-tight joints. Adjustable spring cannot anneal being well away from all heat. No fluttering of valve. No strain on exhaust pipe. Gases are discharged through a flaring opening which intensifies sound, facilitating tuning up of motor.



Easy to install and operate—no complicated parts to get out of order. A size perfectly suited to every car.

The HANDY TERMINAL

25¢ each

Eliminates *All* Terminal Troubles—

No burned fingers—no lost nuts in drip pan—no loose connections

Most ignition troubles can be traced directly to loose connections caused by vibration and jar. The Handy *can't* work loose—the greater the vibration the tighter the jaws of the Handy grip—the better the electrical contact.

The jaws of the Handy are threaded on the inside and engage the threads of the Spark Plug center bolt. One motion raises the ring, compresses the steel spring, releases the terminal and lifts it from the spark plug. There are no nuts to tighten or loosen or fish out of the drip pan. No tools are required. Can be attached or detached in ***one second.***

The method of fastening the magneto cable insures a permanent connection. The ferrule is fitted to the cable and the stripped wire firmly held by a copper clip, making a non-soldered connection that can't work loose.

The Handy is the last word in convenience and efficiency. Made in 3 sizes to fit ***every*** make of spark plug, for pleasure cars, motorcycles, trucks, motor boats, airplanes, etc.

DEALERS

Because the Handy Terminal eliminates ALL terminal troubles and is a great time and trouble saver it is a great seller. National advertising campaign now running—attractive dealer helps. A great winter seller. Write for attractive dealer's proposition. If your jobber can't supply you with the Handy, send us his name and we will see that your requirements are filled promptly. 12 inch Tube Repairs

Can Be Quickly and Easily Made with the

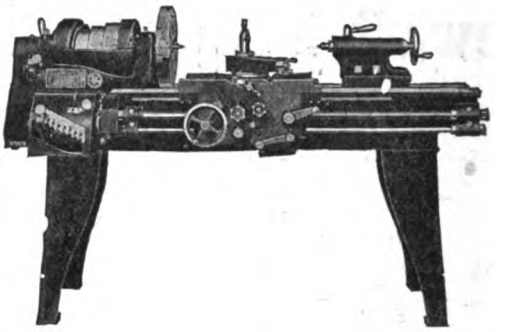
ADAMSON

TYPE "S"

VULCANIZER

This vulcanizer enables the repairman to give his customers a perfect repair at low cost and net him a handsome profit for his time. It enables the private garage owner to cut his repair bills to the bone.

The Type "S," like all Adamson Vulcanizers, is entirely automatic and anyone can operate it. There is no waiting to get up steam. No slow, expensive electricity. It's a gasoline vulcanizer — the most convenient and practical vulcanizer made. There are thousands in daily use.



It absolutely will not injure tubes as will many vulcanizers — the temperature being automatically and positively regulated. Its scientific design insures a quick, permanent repair ***always.*** Even a 12 inch repair can be made in fifteen to twenty minutes— that's speed.

There is money for repairmen and garage owners who use an ADAMSON Type "S." More tubes will be repaired next year than ever before because today they cost more. The Type "S" costs but $12, complete as shown here, and soon pays for itself. It will last a lifetime.

There is a type of ADAMSON Vulcanizer for tube and tire repairs of every kind. Priced from $1 to $12. If you don't know the ADAMSON dealer, write us.

THE ADAMSON MANUFACTURING CO.,
EAST PALESTINE, OHIO.

DEALERS—No other manufacturer can offer you a complete line. Tie to ADAMSON — Adamson dealers have sold over one million ADAMSON Vulcanizers, and they all made good. If your jobber can't supply you, write for details, prices, etc.

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

S. A. E. Standard

LIST PRICE — $20.00

This Screw Plate is very popular among Automobile Accessory Jobbers and Garage Men. It is designed to meet the requirements of the Repair Shop and it does to perfect satisfaction. The O. K. Hammered Dies in this set actually cut easier and much cleaner threads made than with the old style dies. This is entirely due to the extra chip clearance and oiling space provided.

Catalog 8-B tells the whole story.

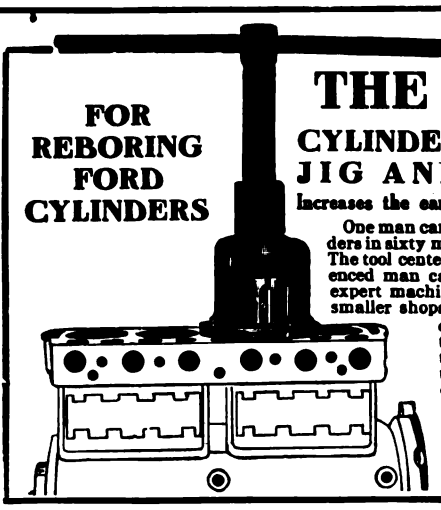
Greenfield Tap and Die Corporation
Greenfield, Massachusetts

HOLDFORD BRAKES

SAFETY FIRST

PRACTICAL

POSITIVE



ASSURES YOUR SAFETY

HOLDFORD BRAKES are high-grade external contracting brakes for Ford cars which can be easily and quickly installed to act from the hand lever as emergency brakes, or from the foot pedal as service brakes. Designed in accordance with the best engineering practice; the band and brace are of steel, the toggle crank and bracket are dropped forgings and the lining J-M non-burn. Do not drag when released, no readjustment for wear is necessary and oiling is easy.

HOLDFORD BRAKES save wear and tear and will be attached by the wise owner on his pleasure car, delivery car or truck. They will positively stop a Ford with locked wheels on *any grade, at any speed, with any load.* Not necessary to remove old brakes.

When Ordering State Whether for Hand or Foot.

THE G. H. DYER COMPANY, Cambridge, Mass.

FOR REBORING FORD CYLINDERS

THE DAVIS

CYLINDER REBORING JIG AND REAMER

Increases the earning power of your shop

One man can rebore a set of four cylinders in sixty minutes with this machine. The tool centers itself, and an inexperienced man can do as good a job as an expert machinist. With this tool the smaller shops and garages can rebore cylinders and guarantee the work to be as good as the larger dealers with their expensive machinery. Makes the motor better than new. Write for price and full particulars.

"NORMA" BALL BEARINGS

(Patented)

Failure of a bearing in a magneto is equivalent in effect to failure of the power plant. Failure of a bearing in a lighting generator is in effect a failure of the lighting system. Either will surely mean dissatisfaction — either may mean disaster and loss.

The proved speed-and-service qualities of "NORMA" Ball Bearings have resulted in their adoption as standards by practically all makers of high-grade magnetos and lighting generators — those used on cars and trucks of the better class.

Kennedy Auto Storage Covers

"Wrap Up" Your Cars When Not in Use

When you store your car for a season, don't let its polish be dimmed by dust, and its metal tarnished before it gets out of the garage. Cover it at once with a KENNEDY AUTO STORAGE COVER, and it will remain as clean and bright as washing makes it, until the cover is removed, next day or next season.

Protects the limousine all summer, or touring cars through the entire winter season. No cost but first cost. Never wear out if care is taken in handling. Insist that your garageman use them.

Popular for Use *and* Sale in Every Garage

Garagemen—Charge extra for storing with KENNEDY AUTO STORAGE COVERS. Service your patrons are glad to pay for. Many will demand it.

Made of strong, heavy paper, reinforced to prevent tearing. Protects a car against dirt, dust and moisture. Prevents polished portions from tarnishing and keeps finish from checking in cold weather, and also prolongs the life of the tires by excluding the light. Furnished for 5 and 7 passenger gasoline cars, electrics, and Ford cars. Good profits in retail sales and service use. KENNEDY COVERS can be sold at a season when trade on other accessories is usually light.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

NATIONAL RUBBER FILLER CO.
208 College Street **MIDLOTHIAN, TEXAS**

900 Pages instead of 824 **1918—SIXTH EDITION** 3362 Illustrations instead of 2000

STILL $3.32 prepaid **Dyke's Auto Encyclopedia.** STILL $3.32 prepaid

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are **50 Instructions**—Simplified and practical.

3362 Illustrations—the kind you understand at a glance.

2 Supplements, parts printed in colors, treating on the construction operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc.

775 Illustrations and **279 pages** on **Electric Ignition, Electric Starters** and **Generators**, etc.

51 pages and **254 illustrations** on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and **1189 illustrations** on **Repairing.** Oxy-Acetylene Welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and **180 illustrations** on **Tires** and **Tire Repairing.**

44 pages and **119 illustrations** on **Carburetion.**

89 pages and **291 illustrations** on **Engine** and **Parts.**

16 pages on **Digest of Troubles.**

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaing to motoring. **Index** begins on **colored** paper, easy to refer to.

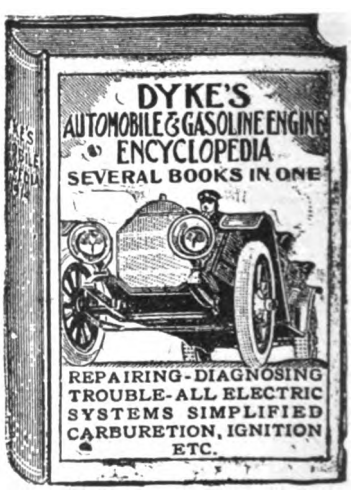
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

You must see this SIXTH Edition in order to appreciate just how complete a book it really is—Order N-O-W.

Price—Although a much larger and better book the price for the present remains **$3.00** (or **$3.28** prepaid, express).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

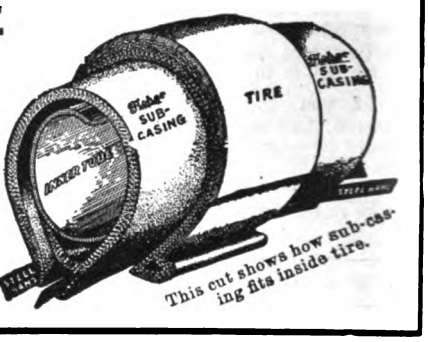
THE Fisher PATENTED "RIM-GRIP" SUB-CASING



MORE MILES PER TIRE
LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.

A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

This cut shows how sub-casing fits inside tire.

Pyramid Brushes

FOR STARTING MOTORS AND LIGHTING GENERATORS

Get Your Share of This Business

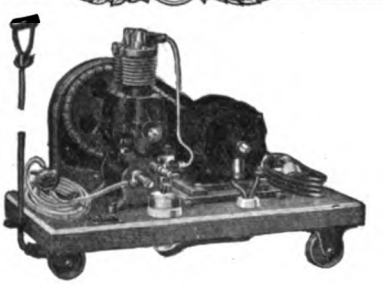
Do you realize the profits which can be made by furnishing brush renewals for the lighting and starting equipment of automobiles? On the great majority of cars equipped with starting and lighting outfits, Three Pyramid Brushes are standard equipment.

Our brush specification list will show you the right brush to use in every case. With it and a good stock of brushes you can get your share of the profits in this rapidly increasing business.

Send for this list today.

NATIONAL CARBON COMPANY, Inc.
CLEVELAND, OHIO

B-W DIRECT CURRENT



STURDILY CONSTRUCTED to retain accuracy under the most severe conditions. Handsome in appearance. Made in both flush and surface types. Finished in bright nickel or black rubberoid as desired.

Better Ammeters Cannot Be Purchased, PRICE.....$1.90

WOODWORTH

Spring Cover and Lubricator

A felt-lined, leather-covered casing that can be laced over the springs in 15 minutes. No need to jack up and spread the leaves—Woodworth Spring Covers protect from rust and dirt—lubricate automatically for the whole season, even to the inaccessible places not reached by ordinary methods.

Cures Spring Squeaks

Prevents Rust and Breakage

Cold, rainy weather is here—and "spring-troubles" for the motorist, Oh! What relief to have every spring automatically lubricated, noiseless, easy riding—protected against grit, moisture, and breakage.

Economical—All Sizes

These covers cost little, preventing constant greasing, wear and breakage; outlast the car itself. To order (if car not listed below), give width of spring leaf, length from clip to end, and measure around largest part.

Running Down Elusive Starting, Lighting and Charging Troubles of the Motor Car.

Practical Methods for Solving Electrical Problems Inherent with the Dynamo, Motor and Battery, and in a Minimum of Time.

BY CHARLES LEIGHTY.

In this day of efficiency, when we are all trying to do the most with the least waste of time and energy, it is surprising how little has been done toward getting at the seat of automobile electrical troubles in a minimum of time.

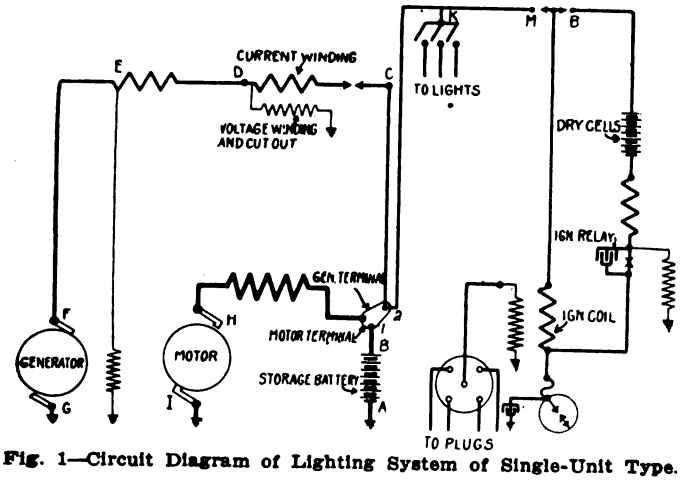

Fig. 1—Circuit Diagram of Lighting System of Single-Unit Type.

I believe it is pretty firmly established that mechanics are anxious to learn how to "shoot" troubles in a workmanlike manner. They read everything written on the subject that is available, still it is more than evident that they go principally by guesswork when called upon to locate and repair electrical troubles.

Difficult to Grasp.

Mind you, I do not say this disparagingly. We all realize how little chance the average man has had to become really proficient. I have been called into scores of shops in the last year or two, and have had a chance to observe just to what extent the average mechanic has been able to grasp this subject. I am convinced that the main reason why men fall down on this work is the fact that it is very seldom put up to them in proper shape to be understandable.

Oh, yes, there has been a great deal written on the subject, and there is hardly a mechanic anywhere but that has purchased one or more books dealing with starting and lighting systems. Our trade papers devote space to it. Still these men have to blunder in their work. Supposing we used the same methods in locating gas engine troubles that we do in locating electrical troubles. How long would we have customers? I know of lots of repair shops whose owners claim that their chief mechanics can listen to a man's car for a moment and "tell right away where the trouble is."

Applying Knowledge.

We all know that there is no man that is able to do this every time, but there are lots of experts who can do wonders along that line, and it seems like they simply have to listen a minute or two and then lay their hands on the trouble. But you men who are gas engine experts know that you don't do it by a sixth sense. It isn't so mysterious after all. All you do is to apply knowledge and reasoning to the problem.

You must know gas engines. But that isn't all; you must know how to reason, how to apply your knowledge.

For example: A man drives up and says, "My engine jerks when I drive slow." You know right away that it misses on low speed. You also know that it may be due to a weak magneto, to leaky valves, to leaks past the rings, to improper carburetor adjustment. If the car has a battery system of ignition you can eliminate the weak magneto theory at once. At any rate you wouldn't remove the magneto, take it apart, and test the magnets first thing. No, sir. If you did, and if the trouble was not in the magneto, you would have all your pains for nothing. You would try out your compression first, would you? You would use reason.

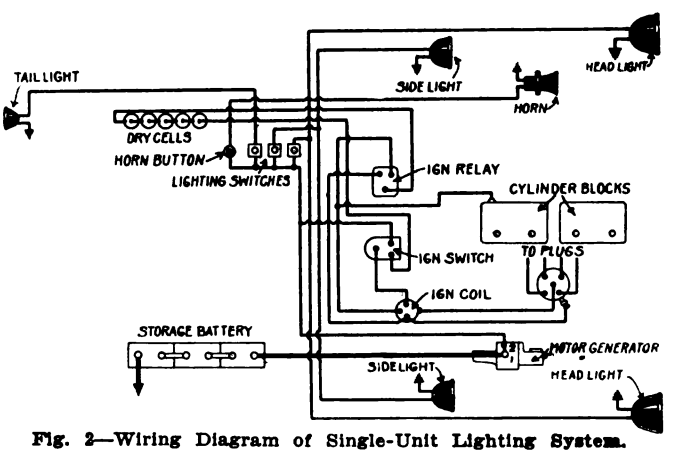

Fig. 2—Wiring Diagram of Single-Unit Lighting System.

Digitized by Google

Knowledge of Principles.

Now in locating electrical troubles we have to use the same practical methods. We must first know the principles upon which electrical systems work. Then we must know the particular system we are dealing with. But that's not all. We must know how to apply our knowledge, how to reason.

How are we to know these different electrical systems? There are two ways of conveying this knowledge. One is by a written description, the other is by means of circuit diagrams. A circuit diagram is to the electrician what a blue print is to a carpenter. It furnishes details.

Don't confuse a wiring diagram with a circuit diagram. A wiring diagram simply shows the relative positions of the various parts and shows where the different wires connect. It shows that a certain wire leads from one point to another point, but it gives no idea, generally, what part that particular wire plays in the general scheme. It doesn't give any idea of what the effect would be if that wire was missing.

The Dayton Engineering Laboratories Co. publishes a Delco Service Manual: This contains both circuit and wiring diagrams for all the earlier model Delco equipped cars, and for the later cars many of the diagrams are combined circuit and wiring diagrams. I expect many of you have secured this mighty valuable book. It is well worth a price, but so far has been issued free of charge. Now this manual contains all the information an electrician needs in doing any Delco work. Of course, it would not be clear to a man who had no idea of electrical circuits.

Value of Diagrams.

I am going to take one of the Delco equipped cars and use it is an example of how readily the majority of the troubles may be located with the help of the diagrams contained in this manual. We will take, for an example, the 1914 model B-24-25 Buick. For the benefit of those who have no manual, Figs. 1 and 2 may be referred to. Fig. 1 is the circuit diagram and Fig. 2 is the wiring diagram. For the further benefit of those to whom the diagrams are not quite clear a brief description of this system and how it works will be required.

This is what is known as a single-unit system. This means that one instrument answers for both a generator and a motor. There is only one armature core, but this core has two windings on it. One is of coarse wire, each coil consisting of few turns terminating at the motor commutator which is made up of a few wide segments of copper. Directly in front of the motor commutator is a commutator of smaller segments to which the generator winding leads are attached. The commutator that is smaller in diameter is the generator commutator.

Winding of Field.

The field consists of three windings. One is a few turns of very heavy "bar" or "ribbon" wire. This is the motor field. It is a series field. It is so connected as to be in series with the armature and storage battery. No current can flow from the battery through the motor armature without at the same time flowing through this series field.

Then we have the shunt field winding. This is the principal generator field winding. It consists of many turns of fine wire connected in shunt or parallel with the generator armature. It is so arranged that any current sent through the generator armature will divide, part of it flowing through the shunt field. Then we have the reverse series field, which is a few turns of coarse wire in series with the generator armature circuit. It is not as heavy wire as the motor windings, however. Another peculiarity about this winding is that the current that flows through it encircles the field core in the opposite direction to that which flows in the shunt field winding.

Automatic Cut-Out Relay.

This motor generator is provided with an automatic cut-out relay very much like the ordinary two-unit system is provided with, except that this cut-out is inside the generator and performs an extra function that will be explained later. This cut-out can be seen by removing the top cover the motor generator.

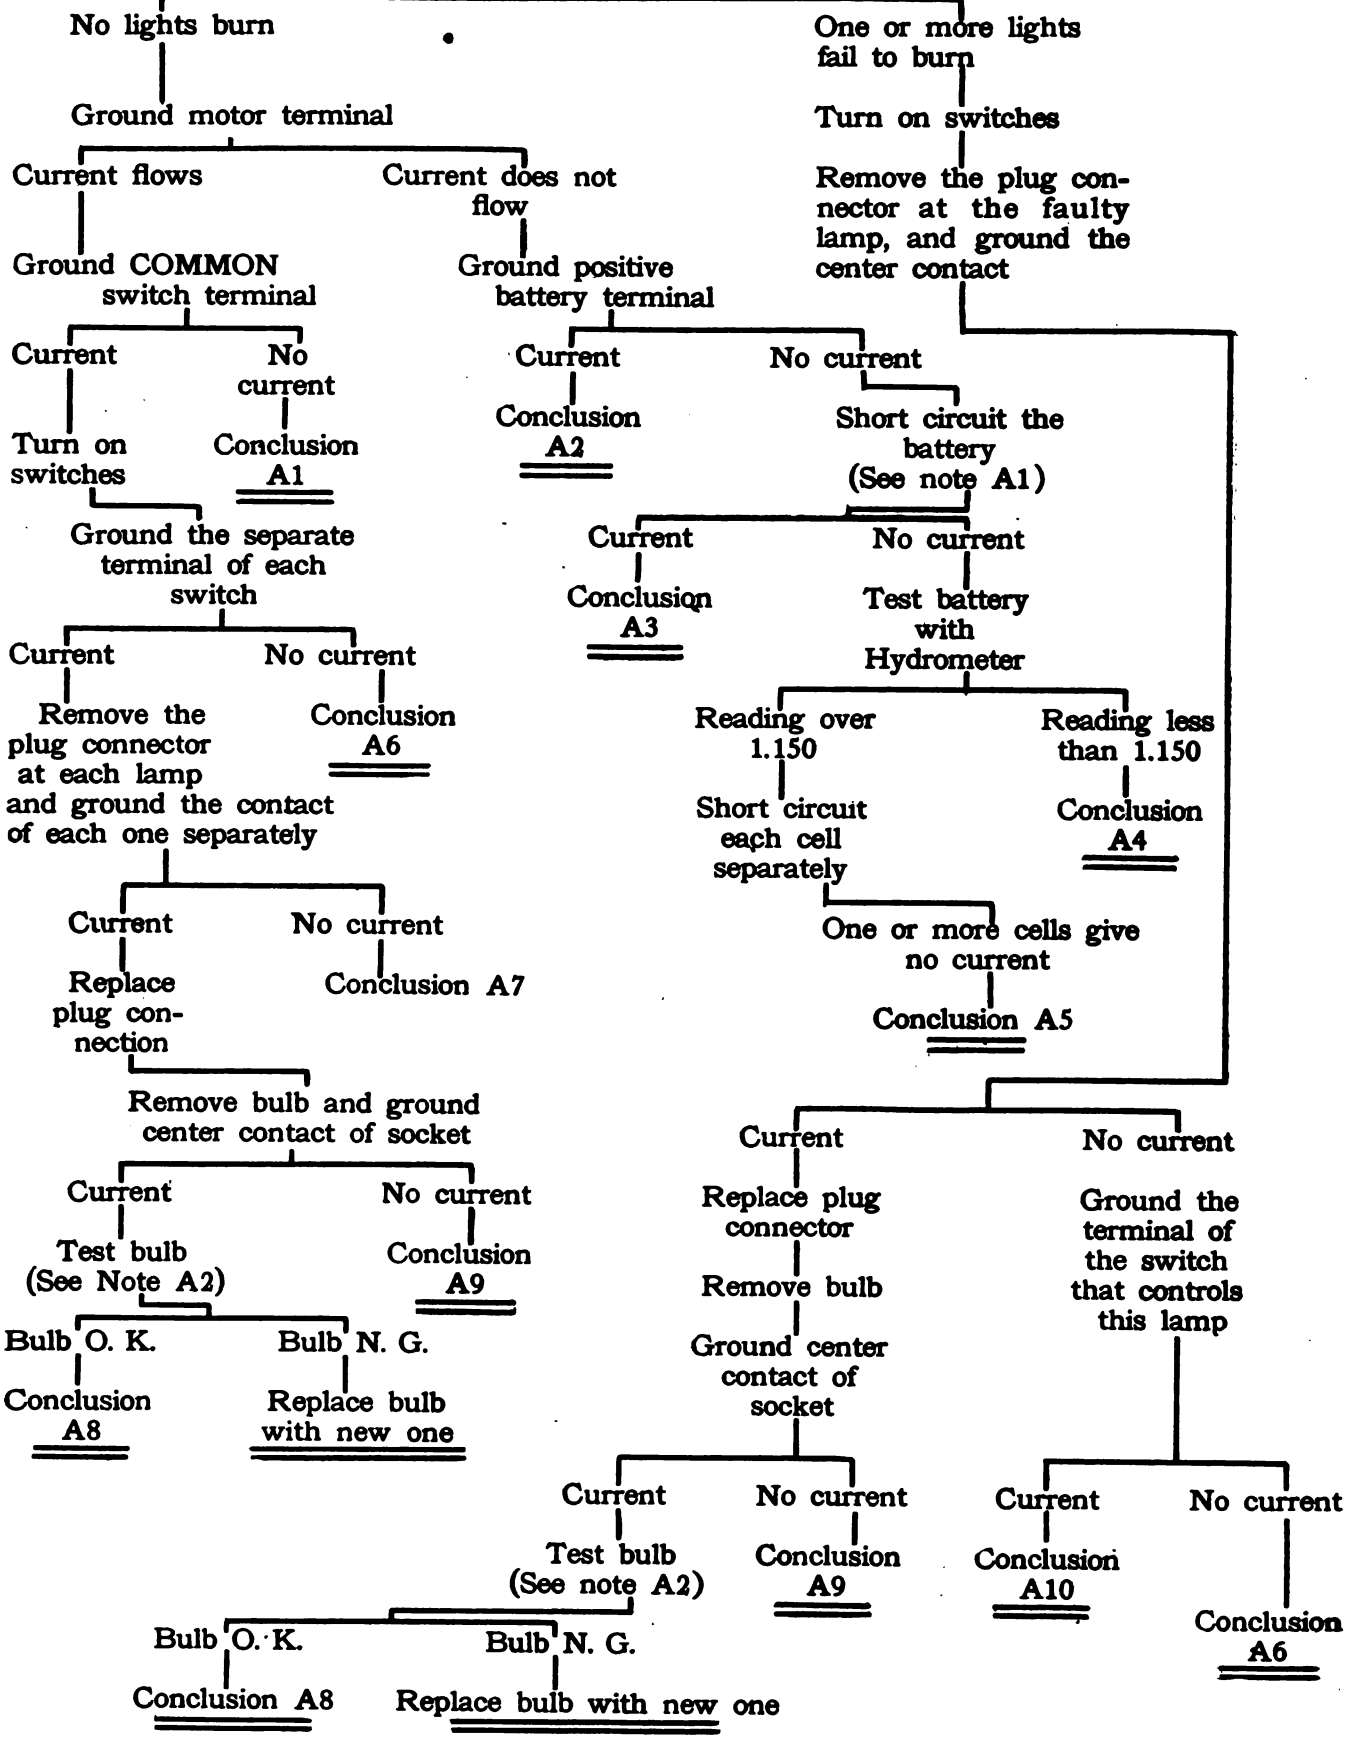
It is provided with two terminals. One (marked "C" in the circuit diagram) leads directly to the generator terminals. The other (marked "D") leads to one end of the reverse series winding of the generator. One terminal of the battery is grounded. The other is connected to the motor terminal by means of a large wire. The motor terminal and generator terminal are really one. They are joined together. Two terminals are used merely for convenience in connecting the wires.

A wire leads from the generator terminal to the lighting switch and to the "M" side of the ignition switch. The lighting switch is a gang of three single-pole switches. One terminal of each switch is connected to the light or lights—that particular switch is designed to control. The other three terminals are joined together, making a common terminal to which the wire from the generator terminal is connected. While the ignition circuits are shown, still we will disregard them in this article and take up only the lighting, charging and starting circuits.

Starting.

We will consider the starting circuits first and point out what happens when we start the engine. First we get all "set" the same as if we were going to crank by hand. Then we push down this starting handle. This operation moves a rod endwise through the motor-generator. This rod closes the cut-out points when it has traveled a short way. At the same time it moves the starting pinion close to the flywheel, ready to mesh with the teeth cut in the flywheel.

When these cut-out points close it creates a circuit between the battery and the generator, causing it to turn slowly as a motor. This revolves the pinion and permits it to mesh with the flywheel teeth. This, then, permits the starting handle to be pushed further down. Further movement of the rod that this handle controls allows the upper motor brush to drop down onto the motor commutator.



Path of the Current.

This brush acts as a starting switch, closing the starting motor circuit. Current then flows from the battery to the motor terminal, thence through the series winding and motor armature to "ground." From there to the other terminal of the battery. This starts the engine. When the engine takes up

Digitized by Google

Chart "A"

LIGHTING TROUBLES

Digitized by Google

its cycle we release the starting handle. This raises the motor brush and stops the motor. At the same time the armature is revolved by means of the overrunning clutch. As soon as the armature begins to revolve it begins generating voltage, which forces a slight current through the shunt field winding and also through the voltage winding of the cut-out.

When the speed becomes great enough to generate enough voltage to charge the battery (about 7.5 volts) the magnetism of the cut-out causes the cut-out points to close. Then the charging current flows from the generator through the reverse series winding, thence through the current winding of the cut-out, through the cut-out from there to the battery, and completes the circuit through the frame of the car.

Regulating Charging.

As the speed of the generator becomes greater the voltage rises. This has a tendency to increase the charging rate. But this increased current flowing through the reverse-series field winding weakens the generator field magnetism, which compensates for the speed increase and thus the charging rate is regulated.

The current flowing through the current winding of the cut-out assists in holding the points closed against the action of the spring. But should the engine slow down, the voltage of the generator might not be great enough to charge the battery. In this case the battery will start to discharge through the generator armature. This then causes current to flow in the reverse direction through the current

Chart "B"

GENERATOR DOES NOT CHARGE THE BATTERY

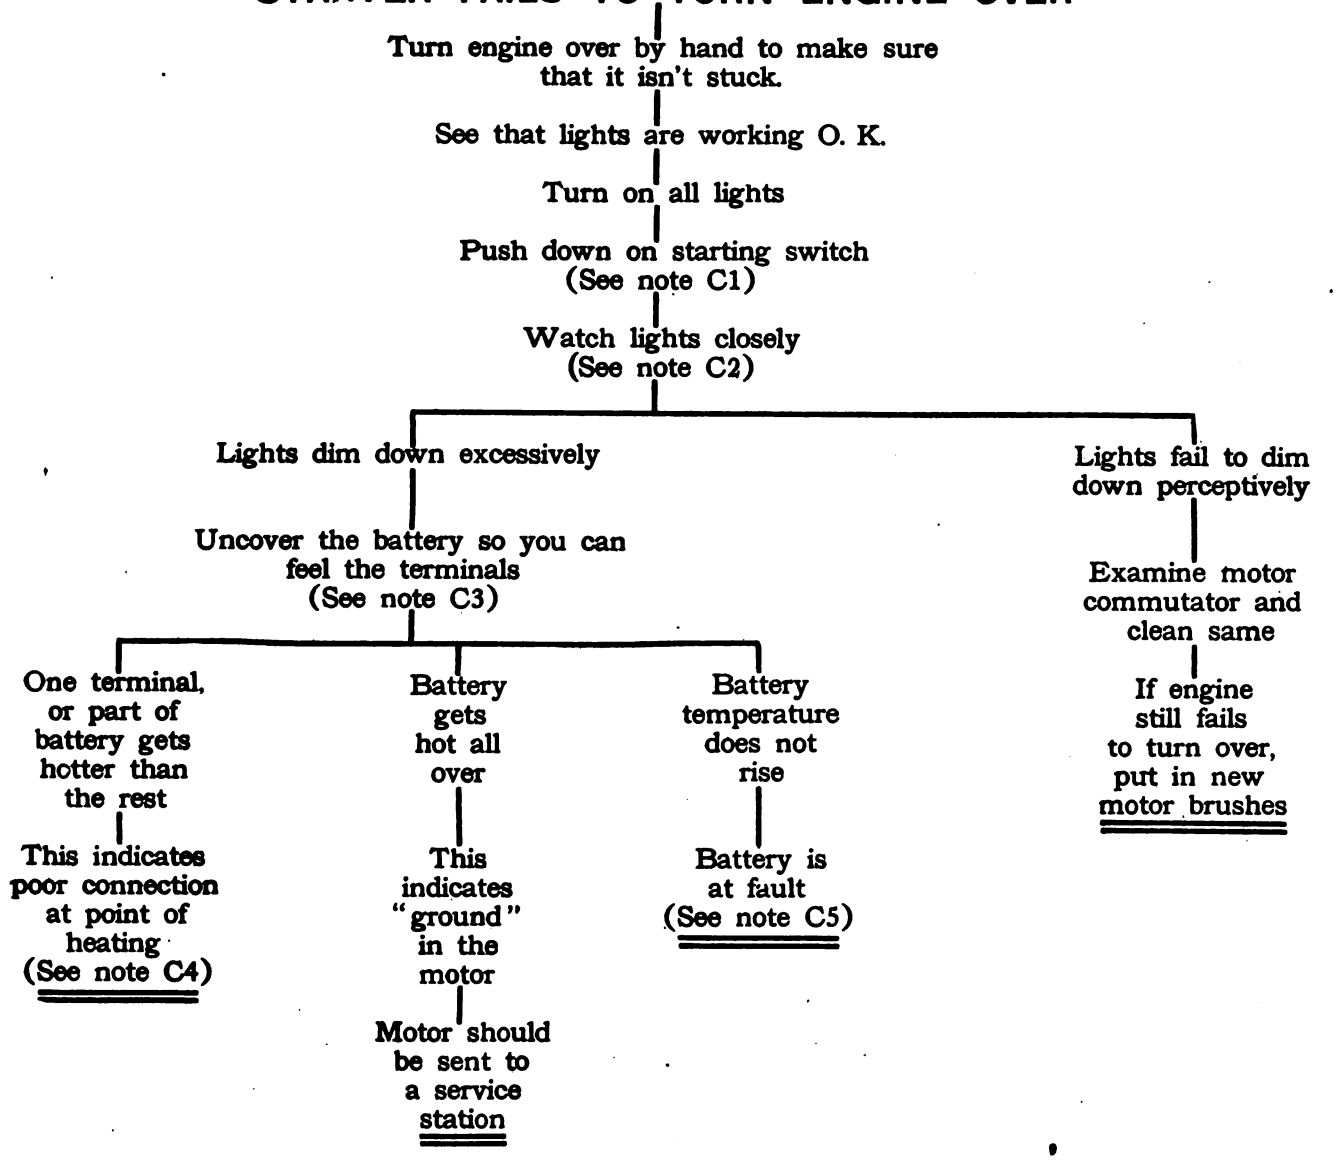
- Remove top of generator case to expose the cut-out.
- Short across the terminals of the cut-out with screw driver, pliers, or piece of wire
- Generator should motor (See note B3)
  - **Generator motors**
    - Trouble is in the cut-out (See note B1)
  - **Generator does not motor**
    - Use an ammeter to connect the two cut-out terminals together
      - Remove cover from brushes at front end of generator
        - **Ammeter shows flow of current of more than 10 amperes**
          - Raise top generator brush, so it does not touch the commutator
            - **Ammeter still shows large flow of current**
              - This indicates that there is a "ground" in the generator or the cut-out
              - Conclusion B3
            - **Ammeter shows small flow of current**
              - Trouble is in the cut-out. (See note B2)
        - **Ammeter shows flow of current of less than 2 amperes**
          - Ground the top generator brush
            - **Ammeter still shows small flow of current**
              - Conclusion B1
            - **Ammeter shows large flow of current**
              - Ground commutator
                - **Ammeter still shows small flow of current**
                  - Conclusion B2
                - **Ammeter shows large flow of current**
                  - Lower brush is not touching commutator. Put in new one.

Digitized by Google

winding of the cut-out. This demagnetizes the cut-out, allowing the points to open, thus disconnecting the battery from the generator circuit.

Lighting.

When the engine is idle the battery furnishes current for the lights. When any one of the switches is closed, current flows from the battery to the motor terminal; thence to the common terminal of the switch; through the switch to the lamp, and from the lamp to ground. The circuit is completed through ground back to the battery. If the engine is running, and the battery is charging, current flows from the generator to the generator terminal.



of the engine increases, the voltage will increase, and will soon cause the lamps to burn out. Then if the engine continues to run with the battery disconnected the excessive voltage will force excessive current through the shunt field winding and through the voltage winding of the cut-out. This will cause them to eventually get extremely hot and do damage. This is why we must take precautions to either remove a generator brush, or short circuit the generator if the battery is removed and the engine is run.

Lighting Troubles.

Now let us assume that a car comes into your

Chart "C"

STARTER FAILS TO TURN ENGINE OVER

here it divides. Part flows through the lamp circuit, and part through the battery.

If the battery should be disconnected it is plain see that the current would have only one path. would flow only through the lamp circuit. The mps are incapable of using as much energy as is sed in charging the battery. Therefore there would ot be the ordinary flow of current through the erse series winding. On this account there would no means of voltage regulation, and as the speed

shop and the lights refuse to burn. There are several things, any one or more of which might cause the lights to fail. For example: the lamps might be all burned out, the contacts at the lamps might be poor, the circuit might be open between the switch and the lamps, the switches might fail to function, the circuit might be open between the switch and the generator terminal, or between the battery and motor terminal; the contacts might be poor on at the battery terminals, the battery might be discharged,

Digitized by Google

one or more cells might be dry, there might be a short circuit somewhere.

This is about all that is ever said in most of the articles I have read on the subject of lighting troubles. A list of possible troubles are given and the man is left with nothing to guide him in choosing the most likely troubles first. For instance, it would be foolish to remove all the lamp bulbs and test them individually to see if they are burned out, until you know for certain whether the current has a chance to get to them.

Result of Poor Contacts.

Let us suppose a case where the ground wire of the battery is making poor contact at the battery on account of corrosion of the terminal. The lights do not burn. The first and easiest thing to do is to ground the motor terminal. In this case there would be no flow of current. This would immediately confine your search to a comparatively small part of the circuit. Then ground the positive terminal of the battery. You still get no current. Now you know at once that the trouble is in the battery itself, or in the ground connection.

Now short circuit the battery. You do get current. Then this leaves no other place for the trouble except at the ground connection, and I wish to remark right here that sometimes a connection looks like it is all that it should be and still will not carry current.

Chart A contains the steps that I would take in locating any lighting troubles. I believe they are in the most logical sequence and following them will lead one to the trouble in a minimum of time. Charts B and C show how to locate charging and starting troubles. Any electrical system could be handled in much the same way.

Conclusions.

A1.
This shows that there is a broken wire between the common switch terminal and the motor terminal, or there is a poor connection at either of these terminals.

A2.
Open circuit between the battery and the motor terminal. May be due to broken wire or poor connection at either terminal. Most likely to be on account of corrosion at the battery terminal.

A3.
Open circuit between the battery and the ground connection. May be due to broken wire or poor connection.

A4.
Battery is discharged. Charge same, and see that it is in good condition before replacing.

A5.
Battery is at fault. Remove it and have it inspected by an expert battery man, or replace with new one.

A6.
Switch is at fault on account of faulty mechanism or dirty contact inside the switch. Best method is to replace switch with new one.

A7.
Open circuit between lamp and switch. May be due to broken wire or poor contact at switch.

A8.
Poor connection between socket and bulb. This can sometimes be remedied by dropping a little solder on the contact inside the socket.

A9.
The wire that leads from the lamp body connector to the reflector socket may be broken or there is poor contact at the connector. This can sometimes be remedied by dropping solder on the contact to make it longer, as in A8.

A10.
There is a broken wire or poor connection between this lamp and its particular switch.

B1.
In this case there might be an open circuit in the reverse series winding, or the wire that connects to the top generator brush may not be making contact. Clean this contact and replace. Then if it still acts the same way, the generator should be sent to a service station.

B2.
The top generator brush is not making contact with the commutator. Clean the commutator, then if this fault still shows, replace the top brush with a new one.

B3.
Remove the two wires from the cut-out terminals. Join these two wires together with the ammeter. If the ammeter then shows small current flow, the trouble is in the cut-out. If the ammeter then shows large current flow the trouble is in the generator itself and same should be sent to a service station.

A1.
Take a short piece of heavy wire. Touch one battery terminal with one end of this wire. Then touch the other end of the wire to the other battery terminal. Make this second contact very quickly.

A2.
Remove the bulb. Touch the center contact of the bulb to one terminal of a good battery. Then touch the metal shell with a wire that has been connected to the other battery terminal. If the bulb is O. K. it will light.

B1.
The cut-out is used to make automatic connection between the battery and the generator when the generator is generating enough voltage to charge the battery, and to break this connection as quickly as the generator voltage falls below the voltage of the battery. This prevents discharging of the battery through the generator. In its operation the points of the cut-out close to make this connection. Sometimes they fail to close on account of improper adjustment. Again, failure to function may be due to an open circuit in the voltage winding of the cut-out. If you are unable to locate the reason for its failure, send it to any good electrician for repairs or adjustment.

B2.
This indicates that there is a ground circuit in the cut-out Should be replaced with a new one unless the fault is located.

B3.
When we say that the generator should motor, we mean that the generator should turn over slowly. In other words it acts as a motor, but it will not attain anywhere near as great a speed as the motor itself. When it is motoring there will be a clicking sound heard at the front end of the generator, caused by the overrunning clutch.

C1.
In pushing down the starting switch the generator will motor as explained in note B3, when the switch has moved only a part of its travel. This is to enable the gear to mesh with the teeth of the flywheel before the motor circuit closes.

C2.
When everything is working O. K. there will be a slight dimming of the lamps when the starting switch is closed. This is on account of the large flow of current through the motor, and the consequent "drop" of voltage across the battery. This dimming will be slight, however; not to exceed ¼ decrease in brightness.

C3.
If the battery is of the bolted connection type, there may be poor connections at the terminals of any of the three cells. This may not be sufficent to stop the flow of current to the lights, and still may not be able to carry the large current required to operate the starter.

C4.
This shows poor connection, as explained in note C3.

C5.
Test the battery with a hydrometer. It is very likely that it needs to be charged. While being charged it should also be tested for any other possible faults by a battery expert.

NEW SIX-HOUR RECORD.

De Palma in Packard Travels 616 Miles, Creating Many New Marks.

A new world's record for six hours was established by Ralph de Palma at Sheepshead Bay, N. Y., on November 16, when the Italian covered 616 miles in a Packard Twelve. His actual distance was 633.12 miles, as De Palma drove above the mark set on the track by A. A. A. The former record was held by Resta, Chassagne and Guinness, who drove a Sunbeam at Brooklands, England, 566 miles and 589 yards on October 1, 1913.

De Palma averaged officially 102.8 miles for the 616 miles and 105.52 miles for the 633.12 miles. At no time during the race against time did his average fall below 101 miles. The best average was 110 miles in the first hour. The speed, exclusive of stops of 15 minutes and 20 seconds, was 111 miles per hour. The car now holds all records from 10 miles up to 600, regardless of class or free-for-all classifications for cars under 300 cubic inches. The time for each hour was as follows:

	New Records.		Former Records. Distance.		
Hr.	M.P.H.	Distance.	Miles.	Yd.	M.P.H.
1	110	110	107	672	107.85
2	109.5	219	195	189	97.55
3	106.9	320.9	287	856	95.83
4	107.2	426.8	380	628	95.09
5	104.4	522	473	464	94.65
6	102.8	616	566	589	94.39

Why the Gasoline Engine Requires Coaxing Before It Will Start In Cold Weather.

A Non-Technical Explanation of the Factors Responsible and Various Suggestions for Overcoming the Trouble.

BY C. P. SHATTUCK, M. E.

The time is fast approaching when the motorist, particularly the owner of an old car, one that must be cranked by hand, will experience considerable difficulty in starting the engine. It is safe to say that it will be even more difficult to start the old car than it was a year ago, for it must be borne in

Priming the Engine from the Dash Makes for Easy Starting.—The Imperial, Made by the Imperial Brass Mfg. Co., Is Adaptable to All Cars.

mind that the fuel now being supplied is not growing any more volatile as the demand increases. The average new owner is prone to blame the fuel, but a careful analysis of the average case will generally reveal a number of factors which contribute to difficulty in starting. By this is meant that there may be reasons other than failure of the fuel to vaporize which are responsible for hard starting of the engine.

Problems of Carburetion.

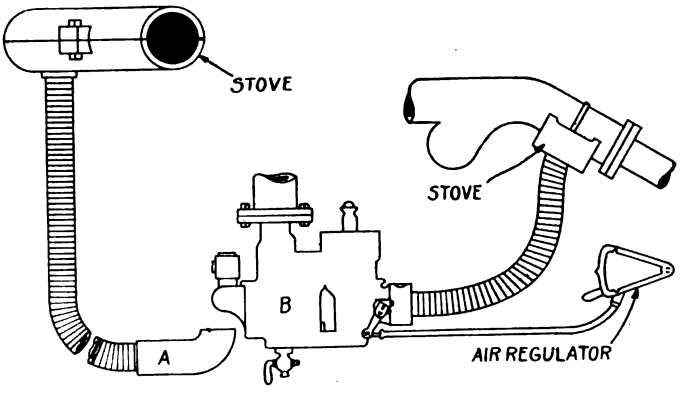
Not only is the owner confronted with trouble in cold weather, but the manufacturer has his problems. It is demanded of him that he supply a carburetor that will make starting easy in low temperatures, provide flexibility at all ranges, obtain plenty of "pep" when accelerated and, last but not least, the device must be very economical of fuel. And the last named is being given serious consideration in these days of the high cost of fuel.

Now, the designer of a carburetor aims to supply a device that will suitably proportion the fuel to the air and to properly vaporize the fuel. In all practical carbureting devices the liquid fuel is brought into the presence of the air with which it is to combine by means of pressure depression exerted upon the discharge end of a tube or passage so constructed and located as to cause the fuel to be carried off by a moving column of air.

Effect of Temperature.

The proportioning of the fuel and the air is subject to irregularities as a result of temperature change, not always seasonal changes, but of the engine itself. The last named changes are greatest, especially with low atmospheric temperatures, and as a result irregularities in mixture proportioning are greater in the winter than in the summer. Changes in the temperature, whether it be the air entering the carburetor, or of the engine proper, tend to alter the mixture proportions. There are other factors involved but these, being technical, will not interest the reader.

Frequent Changes Necessary.



The older types of carburetor generally require more or less changing in the adjustment of the fuel and air supply, and a mixture making for easy starting is generally excessively rich at operating speeds, as is frequently noted by the exhaust of old engines in cold weather. The exhaust is accompanied by a pungent, acrid odor and black smoke. With such carburetors operative efficiency is sacrificed for easy starting, and many owners prefer the latter to the former.

Where Engine Is at Fault.

Owners of old types of engines must not expect to obtain easy starting even if a new type of carburetor be fitted, for there is another factor to be considered—the intake pipe or manifold. If it be long and has many tortuous curves, starting is bound to be difficult. The elimination of the intake manifold, the casting of the cylinder bloc with inlet passages and increased use of heat have been brought about by the low grade of fuel. Such construction, coupled with the rapid rotation of the crankshaft by the motor starter, has eliminated starting troubles to a great extent but not wholly, as will be pointed out.

Mixture Not a True Gas.

When the mixture leaves the carburetor it is not a true gas, it consisting chiefly of liquid particles carried in mechanical suspension in the moving air current. A definite velocity is needed to maintain this suspension, and the moment the speed of the

Advantage Should Be Taken of the Heat of the Exhaust.—The Design at B Shows Control of Air and A Illustrates a Stove.

moving air current is decreased below a certain velocity the larger particles of fuel are deposited on the walls of the intake pipes and the mixture no longer contains that amount of gasoline that was metered into it by the carburetor.

Digitized by Google

Whenever a moving fluid comes in contact with foreign surfaces the velocity of the surface stratum is markedly diminished by the friction of the contact, termed "skin friction," an amount dependent upon the condition of the smoothness of the frictional surface. That portion of the air column which comes in contact with the walls of the manifold frequently falls below the critical velocity, even though the interior of the column be maintained well above it. This wetting of the surfaces is commonly, but erroneously attributed to "condensation." Condensation implies a change of state from a gas to a liquid. As the gasoline has never been a gas, during the process under consideration, the term condensation is a misnomer.

Starting on a Cold Morning Is Made Easy by the Use of Heat.—The Presto Electric Heater, Made by the Metal Specialties Co., Raises the Temperature of the Fuel.

Surface Evaporation.

The liquid film, wetting the walls of the manifold, is subjected to the attraction of the moving air column, with the resulting evaporation of the liquid. This evaporation takes place only from the surface of the fuel and is a slow process with low grades of gasoline. The processes of deposition and evaporation are noted when starting some engines on a cold morning. After running a short time the rate of evaporation, assisted by the rise of the temperature beneath the hood, equalizes with the rate of deposition and the engine runs smoothly and without that "surging."

Curves Decrease Efficiency.

The tendency of the liquid to seek the outer periphery of all curves in the induction pipes is another factor affecting the proper distribution of a mist-laden mixture. No matter how finely the fuel may be comminuted, so long as it remains a liquid its specific gravity is greater than that of the air and, being thrown violently against the outside of the curve by centrifugal force, its velocity is lessened by the impact. The result is a tendency to impoverish the mixture. With the tortuous passages of some manifolds, it is probable that nearly all of the unevaporated fuel is deposited before reaching the cylinders, and it is not uncommon to note with poorly designed manifolds an actual dripping from around the throttle shaft and from the primary inlet to the carburetor, after one has become exhausted by the ineffectual cranking of a cold engine.

While these defects in manifold design have been eliminated to a great extent in the modern engine, it can be readily seen that some of the starting troubles experienced are due to inefficient manifolds. It is important that each cylinder receive an equal quantity, as well as a mixture possessing the same chemical and physical characteristics. Some older types of motors preclude this. Add to these complications those present with the early forms of carburetors and it is no wonder that trouble is experienced in obtaining a mixture that will afford easy starting and operative efficiency.

When Owner Is at Fault.

Difficult starting is frequently the fault of the owner. Dealing with those cars not equipped with motor starters and dynamos and which rely upon the dry cell or storage battery for a source of current supply, it may be said that many owners do not take into consideration the fact that batteries that will start the engine easily in warm weather will fail in the winter. Cold has a certain effect upon electricity derived from chemical action, and because of this fact the dry cell and the storage battery require careful attention. Dry cells reading below 10 amperes should be discarded and all new installed. Storage batteries should be maintained according to the directions of the maker, even the cells charged by the generator of the lighting system.

Parts Causing Trouble.

The timer and distributor may be responsible for difficult starting, especially if dirty, for certain foreign elements set up a considerable resistance to the passage of the primary current, resulting in a weak spark. Worn rollers and metal segments and loose bearings prevent a good contact, and similarly if the points of the vibrating coil be fused or dirty, they impose a resistance in the circuit, affecting the intensity of the spark at the plug. Dirty and oil-soaked wires in both the primary and secondary circuits decrease the efficiency of the spark, for it should be borne in mind that the intensified electricity will always take the path of the least resistance.

Avoidable Troubles.

Failure to start the motor on the magneto—the true high-tension type—in cold weather is frequently due to too large a gap of the contact points or the points may be pitted or dirty. The contact points will wear after considerable service and the space between them when fully separated should be measured with the gauge accompanying the magneto. In the inspection of the components of the ignition system, the motorist, as a rule, overlooks the spark plugs. Many owners do not take into consideration that certain types of plugs have electrodes that are affected by the intensified current; that the gap is increased by the burning action of

Keeping the Radiator Well Covered Is an Aid in Starting a Cold Engine.—The H-M Cover, Made by the H-M Mfg. Co., Indianapolis, Ind., Is Controlled from the Seat.

Digitized by Google

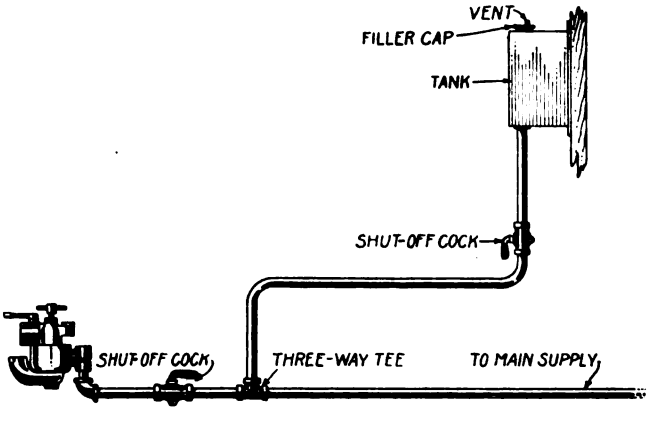
the current. This increase is so slow that it is not noticeable until the motor is hard to start in cold weather.

Natural wear of the spark control linkage and the driving mechanism of the ignition apparatus will contribute to hard starting. Invariably the motorist who starts his engine becomes accustomed to placing the lever on the quadrant in a certain location; in fact, it becomes a habit. With the wear of the linkage, etc., the spark occurs later, and if the engine be started on the magneto some do not take into consideration the fact that it is not always possible to attain the same rate of speed when rotating the crankshaft in cold weather as in the summer. Consequently the spark should be further advanced.

When Mixture Is at Fault.

Poor contacts at the switches are factors making for trouble in starting, and worn pins retaining the throttle valve of the carburetor admit extra air which dilutes the mixture at cranking speeds. Worn valve stems or guides will admit extra air, as will imperfect gaskets between the cylinders and flanges of the intake manifold. Frequently dilution of the mixture is caused by leakage of air between the carburetor and manifold. The amount of air drawn in may be small, but if the fuel supply must be increased to compensate for the extra air, the mixture will be unduly rich at operative speeds, which will breed engine troubles.

When one or more of the above-named conditions exist it is not reasonable to expect the engine to respond to ordinary treatment. One does not desire to expend large sums in correcting faulty design, but starting can be greatly improved by an inspection of the components mentioned to note if faults exist. One must not expect that the installation of a motor starter on an old engine will wholly overcome starting troubles. Under certain conditions the motor starter must have assistance. It will rotate the crankshaft but it will not vaporize fuel of low volatility nor correct ignition or mechanical troubles. Even if the car be equipped with a motor starter, in extreme cold weather and particularly when the car has been standing a long time, it is advisable to enrich the mixture or prime the cylinders or both. The writer has noted instances where the motorist exhausted the battery in endeavoring to start without priming, etc. If the engine does not respond, do not continue to waste current, but prime the cylinders.



The motorist who garages his car in a heated building and who does not expose the engine to low temperatures for any great length of time when it is not running, does not as a rule experience trouble in starting. But the automobilist whose garage is not heated must employ means to coax the engine into life. There are thousands of owners storing their cars in unheated buildings, especially in the suburban and country districts, and whose means do not warrant the installation of heating apparatus. Under such conditions the mixture must be enriched, either by temporarily restricting the air supply or increasing the amount of fuel or both. And it should be borne in mind that during cold weather the air supply should be cut down slightly or the fuel supply increased. The amount and method will depend upon the carburetor.

Flooding Isn't Priming.

The simplest form of priming is to displace the spark plugs and pour about a tablespoonful of gasoline into the combustion chamber; that is, if the engine be not provided with priming cocks. Spark plugs having priming features are marketed and will save time and effort. A few words on the difference between priming and flooding will be of value to the novice and to some experienced motorists. Priming means injecting a rational amount of fuel into the cylinders. Flooding is the addition of more gasoline or other inflammable fluid for the same purpose. The latter condition makes starting more difficult and sometimes impossible. When on an extreme cold day the cylinders have been primed and the engine fails to respond, it is useless to pour more gasoline into the cylinder until the first quantity has been removed. Open the primary cocks and with the ignition switch on, crank the engine. Then close the priming cocks and the engine will generally start. Enriching the mixture does not mean supplying so much fuel that it will not ignite.

Suggestions for Starting.

Some cars cannot be started easily by priming and among the practical methods are: covering the air intake of the carburetor and pouring boiling hot

An Auxiliary Fuel Tank for Storing a Highly Volatile Fluid Will Greatly Aid in Starting the Cold Engine.—Control Is by a Shut-Off Valve in Main Line.

water over it and the intake manifold; utilizing a cloth bag about two or three feet long, filling it with sand and placing in the oven of the stove until thoroughly heated, then wrap the bag around the intake pipe and carburetor; using warm water to refill the radiator when the water has been drawn off, and moistening the electrodes of the spark plugs with gasoline.

While the experienced motorist is familiar with the advantages of thoroughly blanketing the radiator when the car is to be left on the street, etc., the novice will find that by using two robes and covering the hood also, that the heat will be retained for a considerably longer period, for it should be remembered that the heat from the engine rises.

The present grade of fuel has greatly stimulated the efforts of inventors and as a result there are many practical devices marketed which greatly reduce the efforts attendant upon starting a cold engine. These range from a spark plug with a priming attachment to the electrical heating device which raises the temperature of the fuel in the carburetor as well as that of the intake pipe or manifold.

ELIMINATES USUAL COIL.

New Ignition System for Ford Makes Use of Non-Vibrating Coil and Novel Breaker.

One of the disadvantages of the Ford system of ignition is that it includes the magnetic type of vibrator, or the vibrating coil, a system that does not obtain that essential factor, synchronization, and particularly after the coil points, etc., have been in service for some time. The use of the non-vibrating type of coil or transformer with the Ford car has not been practical heretofore because the current obtained from the flywheel magneto or generator is alternating and because there are 16 positions in each revolution where no current is being generated. It is because of these zero positions that a vibrating type of coil is necessary. The Ford system also requires the use of a timer or commutator affording a rather long period of contact or closing of the primary circuit.

The Vibrator-Les System.

An ignition system eliminating the vibrating type of coil and conventional timer has been brought out by the New York Coil Co., New York City, and

Showing the Ingenious Method Employed in Obtaining Rapid Break in Primary Circuit and How Sticking of Contact Points Is Prevented.—The Normal Position of Points Is Also Illustrated.

one of its many advantages is that a rapid and positive interruption of the primary current is obtained without sacrificing the possibility of thoroughly saturating the primary windings of the coil. The coil is of the non-vibrating type, is specially wound to obtain thorough saturation of the primary circuit, and eliminates the regular Ford dash unit which is replaced by a neat panel containing a two-point switch. The new coil is retained by means of a special bracket which is attached or bolted to the studs of the intake manifold.

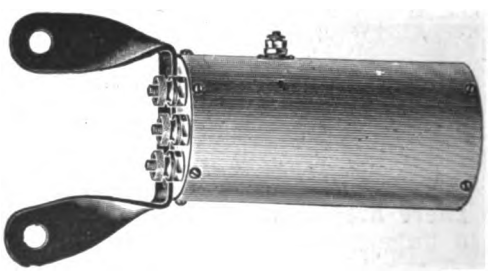
Interruption Is Positive.

The device obtaining the break or interruption of the primary circuit, and which is mounted on an elevating gear bracket, is shown in an accompanying illustration. It is a simple apparatus, one that is practically foolproof, and a construction that should require no attention other than an occasional adjustment of the contact points, the wear of which should be negligible. The operation of the breaker is novel, as it combines magnetic and mechanical action, one checking the other, and the possibility of the points fusing or sticking is eliminated. This is an advantage, particularly when the engine is started by manual cranking.

How Breaker Is Made.

The Rhoades breaker includes an armature, D, carrying a contact point, H. Directly under the

The Usual Dash Coil Is Replaced by a Neat Switch Panel.



armature is a magnet, E, connected in series with the primary of the non-vibrating coil. The member C is supported at one end by a stiff spring so arranged as to normally exert a downward pressure to keep the contact points separated. The part C also engages a hooked section of the armature, further assuring normal separation of the contact points.

Breaking the Circuit.

The closing of the circuit or engagement of the contact points is obtained when one of the four steel pins of the rotating member B contacts with the member C. This raises the member C and allows the armature D with its point to contact with the fixed point L, which is in the form of a screw. This screw is carried in a support and the former is slotted so that it is a simple matter to make any required adjustments.

The circuit is completed through the magnet E when the contact points meet, and the magnet is so energized and the circuit so rapidly established and broken that a shower of sparks is obtained from the secondary of the coil. This action continues during the time the pin makes mechanical contact with the member C. After the pin separates the armature assumes the position shown in the illustration, thus breaking the primary circuit and preventing fusing or sticking of the points as previously explained.

The Vibrator-Les system comes complete with all

The Non-Vibrating Coil Is Attached to the Studs of the Intake Manifold by a Special Bracket.

wires, cables with terminals, also a tube for supporting the high-tension leads. The material and workmanship are first class in every respect and the system has been thoroughly tested under all conditions of service.

Where a Big Fertile Field, a Profitable Market, Is Awaiting Development.

Manufacturer of Accessories and Equipment Neglecting the Small Town and Cross Roads Garage.—How This Trade Can Be Reached.

BY FRANK FARRINGTON.

There has been a good deal said about the development of foreign markets and the makers of automobile supplies have looked longingly toward the South American field where there is an increasing demand for the automobile products of the United States. It is worth while to work for the growth of trade in the other countries of the world, but at the present rate it will be some time before the whole of the home market has been intensively cultivated. There is not yet a full realization of what the rural and small town market for automobile goods means or what are the possibilities of its consumption of accessories and repair supplies.

The other day I took an inner tube into a garage that I know does a business in sales and repairs, amounting to not less than $50,000 a year, and I wanted a tube vulcanized. They did not have any kind of a vulcanizing outfit and could not even vulcanize a tube. At another time I took a casing to another small town garage doing at least as much business as the former and they had nothing with which to vulcanize a shoe though they could vulcanize a tube.

Garages Lack Equipment.

My experience has been that the small town or the crossroads garage does not have the equipment or near the equipment possessed by the city garage doing a similar amount of business. This is not that the small town garage does not need that equipment. It does need it more than the city garage because the latter is within easy reach of places where any kind of work can be done while the rural garage must be more dependent upon its own resources. It is not that the motorists in the rural districts do not need and want the repairs that are needed in the city, because there is no difference in that respect. The same things happen to cars in the country that happen to those owned in the city.

Sends Work Outside.

When I take a car to a small town garage to be overhauled there is a good chance that they will have to have some of the work done outside. They will have to send the radiator away or they will have to ship some other part to a specialist in repairs of a certain kind. They will have to take one part to the plumber and another to the carriage shop and still another to the blacksmith. This cannot be entirely obviated, but if the local garage had the equipment it could do many of the things it now has done in the city. This would mean a better price to the customer and a better profit to the garage and better satisfaction all around.

Is Outgrowth of Small Shop.

One reason, perhaps it is the big reason, why the small town garage does not have the equipment for special jobs and the more complicated work is that such a garage is usually the outgrowth of a small shop or the gradual development of a one-man shop, and the boss has never studied into the matter of available equipment.

The manufacturers of the tools and machinery that ought to be in these garages have not gone after sales there. They have regarded the city garage as the best prospect and they have worked the big town field and left the small town field to take care of itself, not realizing its possibilities.

There are so many automobiles in the cities and we see them congregated there in such great numbers that it is natural to think of the city as the place where the bulk of the automobile repair business must be done. But if we take the number of automobiles per capita we find the country districts holding their own and counties containing no large towns enumerating their one car for every 25, 30 or 35 inhabitants, right along with the city per capita enumeration.

Value of Publicity.

It costs more money for the manufacturer to reach the small towns than to cover the cities where the garages are many and close together, but if it is undesirable to send salesmen to these smaller towns, and in winter it may not be feasible to cover such territory traveling in a car, then there is the trade paper and it has been my observation that the small town garage man is likely to be a better trade paper reader than the city chap. He has more time. He takes the periodical home with him. His employees get hold of it and read it.

Appeals to the small town garage keeper through the advertising pages of the trade paper will go straight home but if they are to pull they ought to be prepared with the smaller town in mind. As a matter of fact they need to be supervised by a man who knows the small town field.

Where Mail Order Fails.

There is no need of telling any automobile supply man about the prosperity of the farmers. Everybody realizes that the farmers of the country are making and are going to make more money in the next few years than they have ever made in their lives. In canvassing a farming section recently selling Liberty Bonds I found the farmers provided with money beyond the ordinary expectations. It was not uncommon to canvass whole districts or valleys back into the hills and sell every farmer on the road. This means that the farmers have the money to buy more and more cars and they cannot get repairing done by mail order houses. They must patronize the nearest garage in the village.

Farmers Are Prosperous.

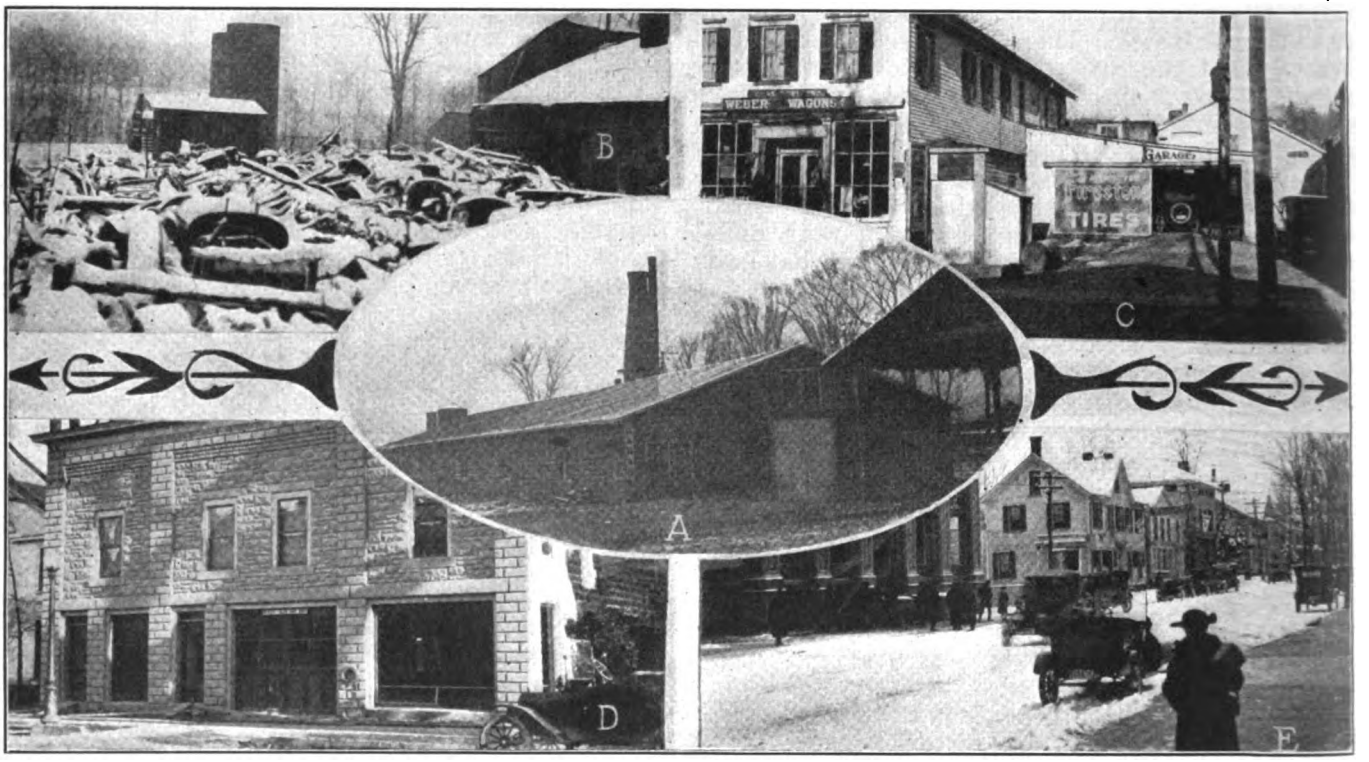
You find farmers to-day buying cars as they would buy a team of horses, not as a luxury, but as a part

Digitized by Google

of their regular farm equipment, necessary in taking the family to town. The old buggy or surrey has been abandoned in favor of the car—and you know you can buy a serviceable car for less than a good pair of horses costs. The business done by the small town garage in the way of repairs and accessories has been in the past too much limited by the demand. There has not been enough urgent insistence by the manufacturer on the garage man advertising his accessories to the rural trade.

Makers Have Neglected Field.

The maker of toilet specialties, food products or wearing apparel, supplies his retail customers with advertising matter to be sent to the consumers in his territory. He urges the dealer to use this matter and there is every effort to make co-operation along this line profitable. How many makers of automobile accessories are working along this line? How many makers of machinery and tools and equipment are urging their garage customers to advertise to the trade the possession of such facilities for handling business? The repair business, in particular, has been left too much to go where it happened. Few garages are after the trade in a way that can be called urgent.



When the big car from the city rolls past the farmer's door the farmer sees it equipped with conveniences that interest him. Very likely he thinks of them as part of the regular equipment of a better car than he can afford, or a make he does not know about. As a matter of fact, in all likelihood most of the accessories are such as the farmer could get and use on his own car if he only knew it. The city owner has access to supply stores where all these things are kept. They are displayed where he sees them and he buys. The farmer too would buy and be glad to if he had the goods shown to him where he could be told their advantages. He would buy if he were only told in advertisements.

Are Good Buyers.

Country motorists are just as anxious to add to their cars the little touches in the way of equipment that mean style, but they are not in touch with such things. It is the same with the country motorist that it is with the woman in the small town who wants to dress well and stylishly. She has not the facilities for getting the things she needs and the motorist is deprived of the same privilege.

When the makers of these additional accessories and of the equipment the garage needs in order to be able to do the best work with the most speed and satisfaction begin to push their lines more intensively in the country districts and in the small towns they will begin to get sales from that part of the trade, and quite naturally those who discover the possibilities of the country first will be the ones first to reap the harvest.

If the country people buy cheaper cars that means all the more opportunity to sell them accessories. because their cars are not equipped with all the needed conveniences when they get them. If they buy cheaper cars it is not necessarily an indication that they cannot afford the bigger, better cars. It is often the case that the farmer lives where a light, cheap car is the only kind he can use satisfactorily owing to road conditions. The farmer living back on a narrow hill road has no use for a big, heavy car. It would be a white elephant on his hands. He must have something that will not easily get stuck in the mud, something that will go into the barn space he has available, something he can roll easily by hand. This man with plenty of money.

Developing the Small Town Garage—A, the Structure Replacing the Wooden Building, B, Destroyed by Fire; C, Type of Garage Frequently Found in Small Towns and the Development of the Vehicle and Implement Business; D, Type of Garage Springing Up in Every Small Town; E, the Farmers Use Their Cars Throughout the Year.

Digitized by Google

though he must use a cheap car, does not need to stint himself when it comes to accessories and conveniences for taking care of his car.

It calls for a big advertising campaign to reach the country folks direct, but it is easy to reach the garage men and through them to reach the users in their territory. If there is any more direct way of reaching these garage proprietors economically than through the automobile press, I do not know what it is.

SHOP HINTS.

In turning and shaping metal on the lathe, planer or shaper there are certain speeds which must not be exceeded or the tool will be injured. In taking a roughing cut on the lathe on wrought iron the speed must be lower than when a finishing cut is being made, because of the fibrous nature of the metal, but with the other metals the speed can be the same with roughing as finishing.

In the case of brass the feed is the same at all speeds, and whether a roughing or finishing cut is being made, though with cast iron the speed should be slower in making finishing cuts. With wrought iron and steel, the feed is faster on the finishing cuts than on roughing cuts. As the diameter of the work turned is increased, the number of revolutions is reduced in proportion. Cutting speeds and feeds are as follows:

Diameter of work in inches	Roughing cuts: Speed in revolutions per minute	Roughing cuts: Feed	Finishing cuts: Speed in revolutions per minute	Finishing cuts: Feed

1 and less	63	25	63	30
1 to 2	57	25	57	30
2 to 3	57	25	48	30
3 to 6	48	20	48	30

Why Annealing.

The reason for annealing steel and other metals is to soften them for one purpose or another. This consists of heating and cooling very slowly as compared with quenching, which produces hardness. Cylinder castings of iron are treated by this process to remove internal strains set up between thick and thin parts. Many notably hard steels are annealed to permit of easy machining, while in parts subjected to shocks which must, however, sustain other loads, the hardening is necessary in order to bring out the best qualities of the material. This requires careful working for physical properties, then equally skillful annealing to remove all internal strains.

Rust Preventative.

To prevent rust, dissolve one ounce of camphor in one pound of melted lard, remove the scum, mix as much black lead with lard and camphor, as it will give it an iron color, clean the machinery or part well, smear with the mixture, and after 20 hours rub off, clean and polish with soft cloth.

Weights of Water and Fuel.

The weight of a gallon of water, pure, at 62 degrees Fahrenheit, the standard figure, is 8.3356 pounds. The usual number taken is 8.33, since all water is not pure, nor can it always be had at that temperature. In round figures, gasoline weighs about 7 pounds, and kerosene 7.9. This makes the former 16 and the latter 5 per cent lighter than water.

Bevel Gear Dimensions.

In giving the dimensions for bevel gears, always mention the pitch or diameter of pitch circle, the number of teeth in both pinion and gears, the width of face, the diameter of shaft hole, the size of keyway or set screw, the backing for both gear and pinion, the size of the hub on both, and location of one pitch line on the length of its shaft. If mitre gears are used, mention this fact.

Cleaning Brass Castings.

A pickle for brass castings can be made by taking three parts sulphuric acid and two parts nitric acid. Mix and add to this mixture one pint of common salt and stir until it dissolves. Use an earthern vessel and then dip articles deep. Remove at once and rinse in clear water. This will clean and brighten the castings.

Layout Work.

To whiten a surface for laying out work, mix whiting with gasoline to the consistency of thin paint and cover the work to be marked. The gasoline will soon evaporate, leaving a white surface on which lines can be easily scribed.

To Harden Reamers.

To harden reamers heat slowly and evenly to a bright cherry red. Quench quickly and immediately immerse in a bath of linseed oil, holding reamers vertically, and draw the temper to a straw color, as for a tap or a die.

Determining Size of Carburetor.

The size of a carburetor is determined by the area of the valve opening and not by the cylinder displacement, as the former more accurately indicates the capacity of the engine. Too large a carburetor, one with too much passage area, will not cause an engine to deliver more energy than would a carburetor having a passage equal in area to that of the valve opening. The use of too large a carburetor not only wastes fuel, but the output of the engine will not approach its maximum. With too small a carburetor the engine will not develop its rated output, as the necessary supply of mixture cannot be obtained at high speeds. In changing one make of carburetor for another, or replacing the old with a new type, these factors should be taken into consideration.

Selecting Tools, Supplies and Equipment for the Private Garage.

Advice for the New Owner Desiring to Undertake the Maintenance of His Machine.—How to Arrange the Garage to Obtain Best Results.

BY CLIFTON EGERT.

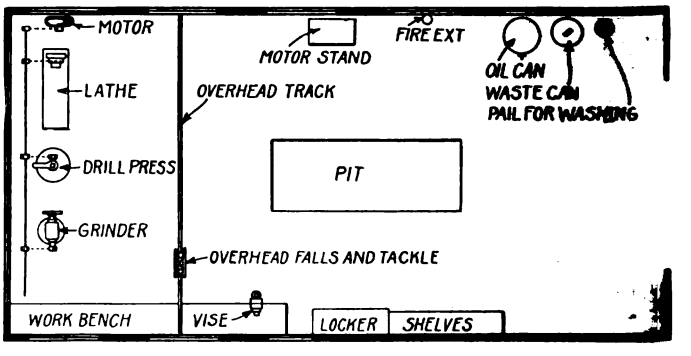
When the new owner, the purchaser of his first automobile, asks the agent what will be needed for the new machine, the answer invariably will be, "Oh, just keep her filled with oil, water and gas, and be sure you use plenty of oil for a while." This

A Suggested Arrangement of a Garage for One Machine and the Equipment Essential for Its Operation.

reply is a stock expression with many dealers, but others will be encountered who will take the pains to explain to the novice what is required to obtain good service from the car, and some will even go to the trouble of suggesting a list of practical supplies and equipment, particularly if the new owner intends to erect a small garage on his premises.

Cataloging the Motorist.

The new owner, as well as his older and more experienced fellow motorist, may be divided into classes. There is the man who keeps his machine at a public garage, relying upon its mechanics to do all necessary adjustments and repairs. This motorist will be content with the tools, etc., accompanying the car. As this story is intended to deal with the owner who looks after his own machine, wholly or in part, the public garage motorist will be eliminated.



When the new owner, the man making his initial investment in a gasoline propelled vehicle and who desires to give his new machine that little attention it requires to keep it in first-class running condition, decides he will utilize a piece of the ground on which his house stands to build a garage, he generally makes a mistake common to the novice. And that is to build too small a structure. In other words, the novice is prone to plan a building for the car without giving any consideration to himself.

Why Room Is Important.

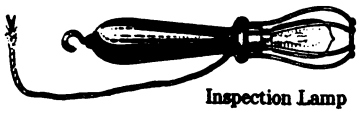
The writer knows of many instances where the new owner built a structure which, when completed, permitted the owner to just squeeze in between the running board of the car and the side of the building. The increased cost of making the garage at least two feet wider deterred these owners from obtaining a garage with sufficient room to work around the machine in comfort. There is another disadvantage of the too small a building and that is when an overhaul of the machine is attempted it means that some of the bulkier components cannot be handled in the building. Speaking from experience, the writer advises that when the plans for the new structure are being made that the mistakes of the economical new owners be avoided.

Standard Equipment.

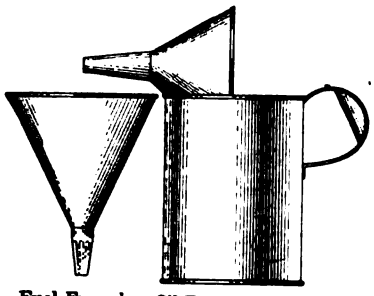
Reverting back to the new owners, there is the class which at first is content with what is termed ordinary equipment, material necessary for the operation of the car. The dealer was partially right when he told his customer he would need oil, gas and water, but he failed to state that the new owner would require other material and equipment. Had the dealer the best interests of his client at heart he would have informed him that inasmuch as the operation of the car depended upon the source of the current supply the storage battery must be cared for. Now, caring for the battery does not mean renewing the supply of distilled water, but an intelligent use of a hydrometer. The second article required for the upkeep of the car is a grease and oil gun or a combination instrument. This, utilized according to the lubricating chart, will save repair bills, for friction is the one thing to be avoided. To renew the supply of water in the radiator one should purchase a funnel. Avoid the cheap tin affairs, as these rust. A combination oil funnel and measure is exceedingly useful, particularly where the ordinary measure cannot be used

Illustrating Equipment Including Machinery Enabling Owner to Complete a Thorough Overhaul of the Car.

to reach the filling member. While an ordinary measure can be used, there is always more or less opportunity for spilling or dripping the oil over the engine.



Necessary Garage Material.



Those utilizing an anti-freezing solution including alcohol ought to invest in a freezometer, an in-

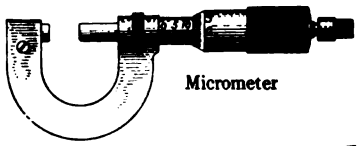
strument for indicating the strength of the solution. It is very important that the proper strength be maintained, particularly if the car be kept in a cold garage. If one buys gasoline in quantity or even in five-gallon lots, a fuel funnel with a strainer or one permitting of the use of a chamois will avoid the possibility of foreign elements reaching the needle valve and spraying nozzle of the carburetor. Economical results will be obtained from the tires only when they are kept properly inflated, so add a tire gauge to the list. Cuts will occur in the casings, and these should be cleaned and vulcanized as well as punctured inner tubes mended. A very efficient and inexpensive vulcanizer can be purchased, and it is a good investment. Include a tire valve tool for renovating damaged valve stems, and at the same time buy a few of the tire valves; that is, the part that screws into the valve.

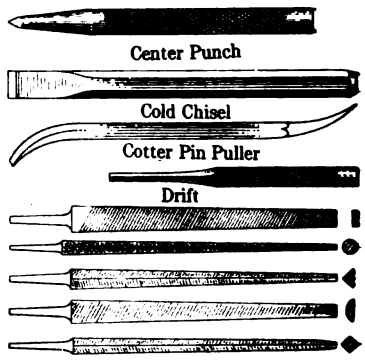
Fitting Up the Garage.

There is certain equipment that should be found in every private garage. One of the first investments to be made is in some type of a fire extinguisher if the car be not equipped with one. Incipient blazes are likely and with an extinguisher they can be checked. If waste is used or old rags, for that matter, the oil and grease soaked members should not be thrown on the floor or left around the building. Such rags have been the cause of more than one mysterious fire and which has been blamed to faulty electric wiring. Keep all such rags and waste in a can, one having a cover. It is all very well to say you will burn these old rags, but they are frequently forgotten. Invest in a trouble or inspection lamp, one having a good grade of cord and a sturdy cage with a hook. This lamp can be plugged in as needed.

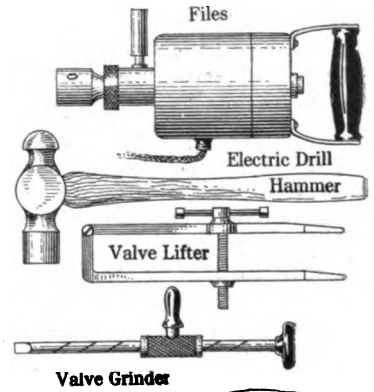


Work Bench, Lockers, Etc.

The new owner may think he will not do any adjustments or repairs about the car, consequently he may feel as though he will not care to go to the trouble of building a work bench and buying a vise, but the first time he has to struggle with some part requiring to be firmly held he will regret he didn't buy that vise. It is better to invest in a good vise, one having at least three-inch jaws and opening four or five inches, than to buy a cheap one. Shelves and lockers are decidedly useful, the former for storing small supplies and material and the lockers for preventing use of nice tools by others than those intended. The equipment described will serve the purpose of the owner who does not care to undertake repairs or the overhauling of the car.



Adding to the Equipment.



As the new owner becomes more familiar with the components of the car and acquires knowledge by that old reliable teacher, experience, he will augment his tools, etc., with new and useful members. Among the first will be the valve-lifting tool, a device for compressing the valve springs while the retaining member is displaced, for the valves have to be removed to be reground. In selecting the valve lifter pick out one that is best adapted to your car, although universal lifters are made. The dealer who sold you the car or his head repairman will advise you as to the tool best suited to your valves.

as a screwdriver can be used if the valve heads are slotted. If not, a tool will be required, also some abrasive. The next investment is very likely to be

Arrangement of a Two-Car Garage and Equipment Necessary for Upkeep of Machines.—The Dotted Lines Represent a Removable Partition.

carbon-scraping tools, and these are not expensive. About this time the new owner will discover that he requires a good hammer and he will want a machinist's hammer. Select one weighing about 1½ pounds, although a pound hammer will do. As one continues to do more and more adjustment work the more will special wrenches appeal.

Fixed spanners or S wrenches are indispensable when dealing with standard nuts and bolts, as these tools can be worked from vertical to horizontal. The socket or box wrench outfit, where the openings fit all sides of the nut or bolt, is a valuable addition to the tool equipment. Generally these outfits include a universal member, extension and some form of wrench proper permitting of moving in places not accessible with the ordinary wrenches. The equipment often includes a socket for removing spark plugs, etc.

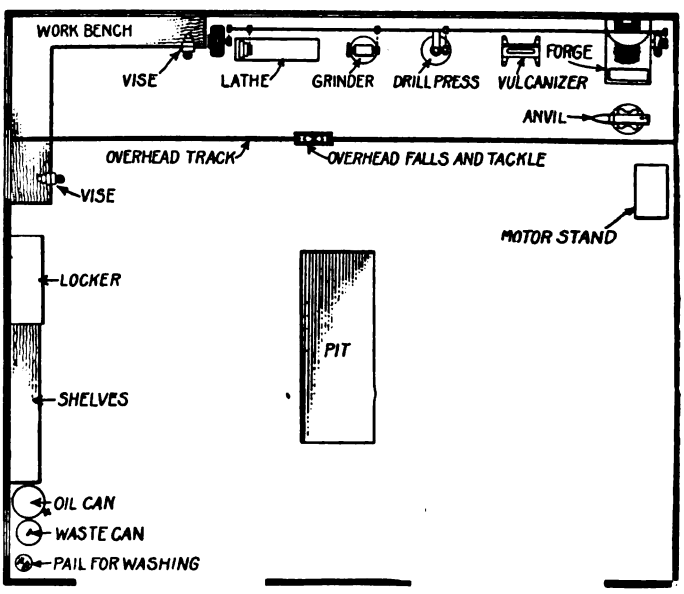
Useful Wrenches.

While the plier equipment is most important, and should include a pair of cutting members, the wrench outfit requires careful consideration. In addition to the S wrenches and those coming with the car, one will need for overhauling work an all steel about 12 or 14 inches long, a Stillson or pipe wrench and a small bicycle wrench. The adjustable end wrench is useful in places where the straight handled member cannot be applied. If the purse will stand it buy two Stillsons, one about six inches long and the other eight or ten.

In selecting the screwdrivers do not invest in cheap tools, for it is poor economy. Screwdrivers are called upon to do hard work and three will answer all practical purposes. One should be about 10 inches long, a metal forging with two wooden pieces forming the handle. The second should have an all wood handle for testing ignition, while the third can be a small affair for handling very small screws.

Files, Chisels, Etc.

In selecting files pick only those of the best quality. The list for all kinds of work should include an eight or ten-inch round bastard; flat, half round and square mill files of the same length, a small rat-tail and a three-cornered saw file. A file for cleaning contact points of the timer-distributor or magneto can be included. Chisels are inexpensive and are known as cutting, cape, diamond nose and round nose. They are steel forged, hardened and ground, so a keen cutting edge is available. Of those named the cold, cape and diamond are best adapted to automobile work. A center punch and drift or closed punches are useful, as is the cotter pin puller.



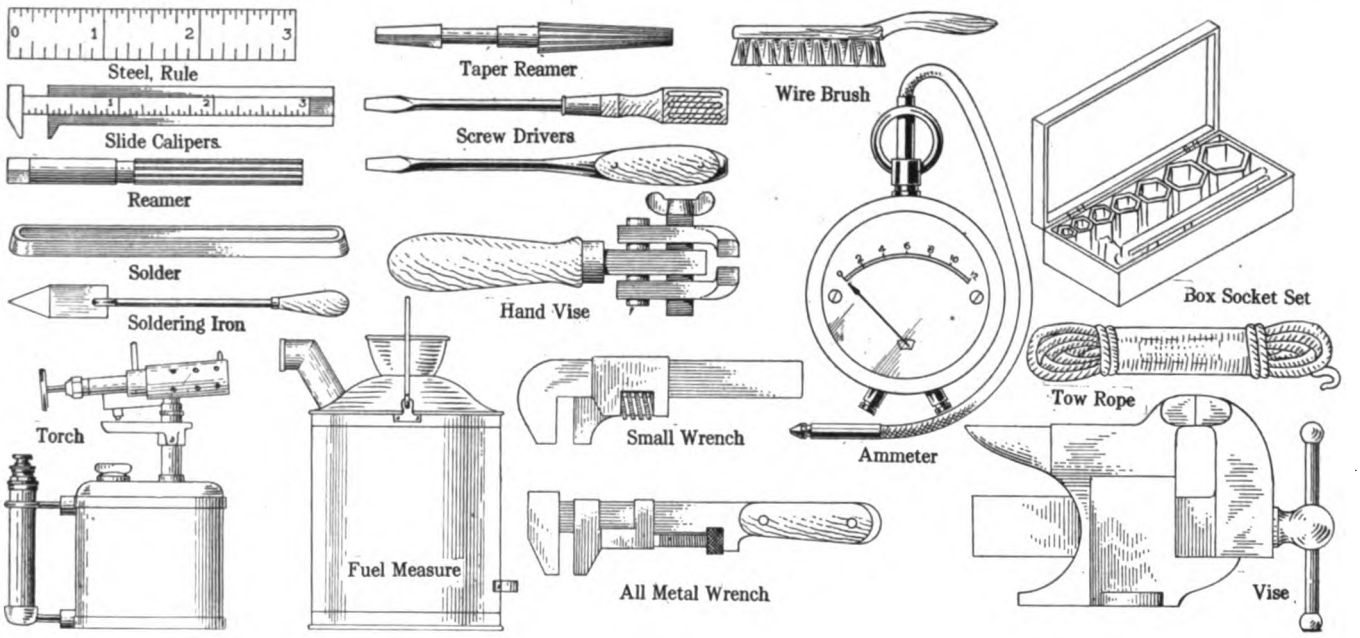
The hacksaw, an adjustable one, with both fine and coarse blades, is essential if metal is to be cut. An offset screwdriver, bearing scraper and piston ring tool can be utilized to an advantage where the power plant receives a thorough overhaul.

Supplies and Small Material.

A well-equipped garage will include in its equipment a soldering iron and flux and a torch. The last-named come in two forms, a pressure and an automatic. With the mass of wiring and connections about the chassis there is more or less use for a torch and soldering outfit. The older the car the larger will be the amount and variety of small material required. This will include a roll of friction tape, soft copper and iron wire, assorted cotter pins, lock washers, taper pins, nuts and bolts and cap screws. In addition there will be packing, both for water and exhaust joints, candle wicking, graphite, hard and hand soap and other small material of service in keeping the old types of machines in running condition.

Machinery and Power Tools.

As time goes on and the novice becomes a full-fledged repairman he will have a craving for power tools, tools that save hard muscle and bone labor. In recent years the power-driven tool for automobile work has been highly perfected, thanks to the fact that electricity can be obtained about everywhere. A useful tool is the combination drill and grinder, a tool that can be moved about the garage



A Suggested Equipment of a Garage for Two Vehicles.—It Affords the Mechanically Inclined Owner Every Facility for Completing Repairs, etc.

Digitized by Google

for drilling holes, etc., and can be clamped in the vise, and an emery wheel fitted for grinding work. When one cannot afford the electric drill he must be content with the breast drill. With either one will want a set of drills, and drills may be bought one or two at the time and as required. Mention should be made of the wheel puller, a most useful tool, particularly if a wheel refuses to leave the axle or a flywheel or gear proves stubborn. The adjustable type is to be preferred; that is, a puller that can be used for all around work.

Measuring Tools.

Measuring tools will be required as one becomes more proficient in the art of repairing the car. A pair of outside and inside calipers will not be expensive, but for really fine work and where it is done on the lathe, etc., the micrometer will be necessary. This enables one to make very fine measurements and handle accurate work. A steel rule is not costly and is superior to the wooden member. Slide calipers can be added, and mention must be made of the need of reamers, both the hand and taper, and the machinists' hand tap and dies. Gauges, thread,

drill tap and steel wire can be added from time to time. To give a complete list of the power driven equipment for the private garage and which would answer equally as well for the repair shop, would but bore the reader. A sufficient number of tools, etc., have been described to give the owner an idea of the equipment.

Laying Out the Equipment.

The arrangement of the equipment which is capable of doing any and all work requires careful study to obtain the best results and to husband space. Accompanying illustrations suggest how the space may be best utilized, the drawings showing four different types of garages with varying equipment.

After reading this article one will naturally arrive at the conclusion that much equipment will be necessary to maintain an automobile and that the initial expense will run into hundreds of dollars. This is not the idea the writer intended to convey; in fact, it will be found to be exactly the opposite, for the average new owner will make his purchases from time to time as the tools, supplies and material are required. And he will frequently pick up at special or bargain sales a tool that which he has desired for a long time.

It is astonishing how rapidly one will acquire a complete set of tools by buying one here and another there. When it comes to the installing of a lathe, grinder, drill press and other machinery, that is a different matter. These are shown, however, in the floor plans of the garages and are not absolutely essential, as the machine work can be carried outside. There are, however, many owners who delight in using the lathe, etc., and among these will be found highly proficient machinists.

Keep the Carburetor Clean.

Keep the carburetor free from foreign deposits and strain the fuel in cold weather. Starting is none too easy when the engine is cold, and the presence of foreign matter in the spraying nozzle starves the mixture. The filter should be opened at least once a week and a small quantity of the fuel drawn off to avoid the possibility of water reaching the float chamber of the carburetor. Water in this part will freeze, and should it do so one will experience considerable trouble in releasing the float from the ice. to say nothing of starting.

Goodrich Rewards for Suggestions.

The B. F. Goodrich Co., Akron, O., utilizes the suggestion idea from employees on benefiting its production. Over 1,200 suggestions were received from 801 employees, one man presenting 25. He received prizes for four. The rewards vary with the nature of the suggestion, some being $25 and others as low as $9.

When It Is Safe to Remove Fan.

The fan can be dispensed with when the car is operated in low temperatures and when the cooling fluid is water or an anti-freezing solution which does not heat readily.

NEW YORK, DECEMBER, 1917.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

THE "NON-ESSENTIAL PLEASURE CAR."

The practice of referring to the passenger automobile as a "pleasure" car is in keeping with that of designating it as a "non-essential." There is no such thing as a "pleasure" car. There is only the so-called "pleasure" car. As a distinct type it never existed. There are thousands and thousands of these so-called "pleasure" cars and in amazing variety, but the greater majority will be found in commercial service. The city dweller who employs his car for business and the farmer who utilizes his vehicle for transporting merchandise and the members of his family can hardly be classified as owners of "pleasure" cars. The passenger car is a necessity. There is infinite business service in it.

DEADLY CARBON MONOXIDE.

Vaporized fuel when mixed with air and burned in the cylinder of the internal combustion engine is useful, but the products of this combustion consist mainly of carbon monoxide, which has a serious asphyxiating effect on anyone who may inhale these deadly fumes. It is not easy to educate motorists to realize the seriousness of the danger because the carbon monoxide itself has no appreciable odor, and very often the first warning of its presence is the sudden collapse of the person inhaling it.

Its effect is first noticed by a slight ringing in the ears or a slight giddiness, and frequently those who have inhaled a sufficient amount to develop these symptoms become unconscious even after they reach the open air. Cases have been recorded where the affected person has collapsed after leaving the garage and some time after breathing in the deadly fumes.

The new owner, and the more experienced motorist, for that matter, should avoid running the engine in the garage with the windows and doors closed. The practice of operating the engine "just for a minute," and while making an adjustment, is inviting danger. If the carburetor must be adjusted or other work performed which requires running the engine, do this work in the open air. Unless there be a sufficient draught to carry off all of the fumes, avoid running the engine in the garage. And it is a difficult matter to get rid of all of the fumes, as they accumulate very fast.

WILL BENEFIT THE REPAIRMAN.

Any curtailment in the production of motor vehicles cannot but help the repairman and all signs point to his enjoying an unprecedented era of prosperity during the balance of the war and for some time to follow, for thousands of owners who make it an annual practice to exchange their cars for the new models will continue to use their old machines. This means that there will be more or less work to be done on these vehicles and that the repairman must increase his facilities to care for this business. The manufacturer of tools, equipment and machinery will be benefited also, as will the maker of those devices making for ease, convenience and economical upkeep of the motor vehicle. A great many repairmen will find it necessary to enlarge their shops.

MAY SOLVE THE PROBLEM.

The disposal of the second hand motor car, the traded-in machine, has been and is more or less of a problem. Various plans have been advocated and put into practice, but while these have aided in disposing of the vehicles the dealers have not always obtained a reasonable profit. A practical solution of the problem is in sight. It is a healthy demand stimulated by the decreased output of passenger cars. Not only will the dealer be benefited, but those owners disposing of their machines will obtain a better price.

A SENSIBLE CHRISTMAS PRESENT.

At this season of the year one's thoughts naturally turn to Christmas. One of our subscribers makes a practical suggestion when he writes that he is to present his friend, who has recently purchased a motor car, with a year's subscription to the Automobile Dealer and Repairer. It is a suggestion worth entertaining by our readers, many of whom may have friends owning a car or contemplating the purchase of one.

BUILDING WINTER BUSINESS.

There was a time when the dealer and repairman viewed the approach of cold weather with alarm, as a season of depression. That was before the motorist was educated to the practicability of utilizing the automobile the twelve months of the year and before the enclosed body, electric lighting and starting, heating apparatus, priming devices, etc., were highly perfected. And previous, too, to the introduction of

Digitized by Google

heating apparatus for the individual or detached garage. These articles obtaining comfort and convenience afford the dealer an opportunity to be very active in the winter, to so balance his business that the season when completed will be a highly profitable one. Every effort should be made to secure new trade during the winter, for it is building for the summer, for permanency.

WHERE A BIG MARKET WAITS.

The progressive manufacturer in planning his 1918 sales campaign will give careful consideration to that most fertile field, the small country and crossroads garage and repair shop. Catering to a prosperous clientele and free from the competition existing in the cities, the country garage and repair shop affords a most profitable market to the manufacturer of accessories, equipment and supplies. Personal solicitation of this most desirable trade may not always be practical because of the selling expense involved, but the owner of the garage or repair shop can be sold through the medium of the trade publication circulating in this field, for he reads his paper from cover to cover. Properly prepared copy cannot fail to develop this most fertile field.

THE POWER OF ADVERTISING.

It is estimated that upwards of $100,000,000 are spent in this country annually for advertising in the thousands of daily, weekly and monthly publications. And yet one of our intelligent congressmen —for whom his constituents ought to be thoroughly ashamed—stated on the floor of the House of Representatives last summer, that he had never read an advertisement in his life. He was advocating the idea of charging publishers a heavy extra price for postage on the advertising sections of each publication. In point of fact, that particular idea prevailed finally, and a section of the big tax bill provides that postage shall be collected beginning with July first on the reading matter at one rate and the advertising at another and much higher rate.

It is quite apparent that a campaign of education is needed in the House of Representatives, if not in the Senate, on the question of advertising and the tremendous influence it exercises in promoting the business interests of the entire country. The man who doesn't read advertisements, and read them regularly, watching out for new things, is missing a great deal.

The advertising department of any trade journal is usually of more value to its subscribers, so far as dollars and cents are concerned, than the reading matter. Our readers in writing to advertisers for circulars, catalogues, etc., are requested in each case to mention that the advertisement was seen in the Automobile Dealer and Repairer.

HELP US AND YOURSELF.

We would like to add several thousand new subscribers this winter. If each one of our subscribers persuades just one of his friends to subscribe, our ambition would be realized, and a great deal more.

We do not ask anyone to perform this service from purely philanthropic motives. We are willing to pay for it and in the following manner: We will extend for three months the subscription of any present subscriber who sends us a new subscriber, with a dollar, and the new subscriber can have the benefit of our new special offer, to subscribers only, or 15 months for one dollar. Any reader introducing the Automobile Dealer and Repairer to a friend will be conferring upon that friend an even greater benefit than he confers upon the publishers.

A WORD TO OUR SUBSCRIBERS.

It will soon be necessary for a great many readers of the Automobile Dealer and Repairer to decide whether or not they wish to renew their subscriptions.

If we are publishing the desired practical information you will want it another year. Many subscribers write us that they cannot secure from any other publication the same valuable information supplied by the Automobile Dealer and Repairer. One man wrote us the other day that one article in the first number he received after his subscription began was worth to him $10, or enough to pay his subscription for 10 years.

We receive hundreds of unsolicited testimonials from our subscribers as to the superior merits of our publication. The following are a few samples:

C. S. Hichborn, president of the National Granite Bank of Augusta, Augusta, Me., writes: "I know of no bill which I pay so cheerfully, and no publication out of which I get so much of interest to automobilists as the Automobile Dealer and Repairer. I read regularly four others."

R. G. Matthews, Barnesville, Ga., says: "I have seen a number of publications in this line, and want to congratulate you on getting out the very best of them all. Indeed, no others compare with the Automobile Dealer and Repairer. One can get from it more information at less cost than from any other source I know."

C. J. Arnold, of Northampton, Mass., writes: "I want the Automobile Dealer and Repairer as long as I own a car. I consider it the best paper that I take (I have three) for practical use. If the price were three times as much, I should want it just the same."

Dr. J. J. Simons, of Kingston, N. Y., says: "I have been a subscriber for five different automobile journals in the past, and I consider yours the best of the lot."

Readers should not forget that next July the rates of postage are going up to such a point that the publishers must contemplate the question of a raise in subscription rates. We are willing to take chances on a year more at the regular rate of a dollar, and will go even further than that, and take chances on two years for $1.75; but beyond that we cannot go, without the possibility of serious loss.

We suggest that subscribers send their renewals as promptly as possible. Each one will be notified when his subscription expires, and he will confer a distinct favor on the publishers by responding promptly with a check or a remittance in any convenient way.

Watch the Spark Plug Gaps.

It is a good plan to occasionally remove the spark plugs and test their gaps. This should be done with a gauge and not a dime as suggested by some instruction books, etc. With some types of plugs the action of the intensified current, the burning action, increases the gap. Often this increase is very slight, but it may be sufficient to be the cause of hard starting or that troublesome miss at low engine speeds. Too small is better than too large a gap, particularly where cranking by hand is done and when the source of current supply is mechanical.

Making the New Garage, Repair Shop or Service Station Pay More Than a Living Wage.

Why Some Achieve Success and Others Fail Even When a Large Volume of Business Is Transacted.—Suggestions for the Inexperienced.

BY W. O. MANN.

Making a start with a new garage, repair shop or service station is something that is done so often that one might easily be misled into the idea that it is a simple thing to do. It is such a commonplace occurrence, in truth, that many are misled, to their subsequent undoing. Certainly it looks simple enough on a busy day when the cars are rolling in

A Tool for Cutting Keyways on a Lathe.

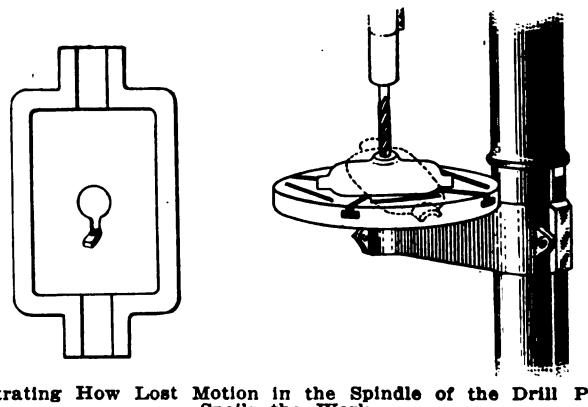
and out and everyone is hustling around to take care of customers, and it is not at all astonishing that one who is inexperienced should get the idea that there is nothing to do but let the cars come and go, do the work on them and collect the bills. Yet the fact is that all this might be done and a large amount of work handled without making money enough for the proprietor to make the business worth his while.

Success and Failure.

Going around and inspecting other garages is unsatisfactory because the view obtained is an outside view solely. The inside workings are not on the outside, and the inside workings make the difference between success and failure. If a man with the garage or repair shop idea in his brain is so fortunate as to have a friend who will let him take a look into the very inside of the business machine it will be worth much. Otherwise he will have to stand on his own feet. There is a point to be borne in mind that is very steadying, if realized, and that is that of the hundreds of new businesses that are started up every year only a very small proportion ever get further than just making money enough to keep the proprietor alive. A great many do not even do that. There are so few that really become successful that it is as clear as daylight that the man who inaugurates a business with the idea that it is going to be smooth sailing right along, and that he can succeed with only ordinary effort, is reasonably sure to do one of two things. Either he will be awakened from his dream by the hard knocks of reality or the thumps will put him out of business—or at least keep him dribbling along, neither a success nor a failure.

System's the Thing.

It is utterly essential that everything that is done should be done in a systematic fashion. If the men are left to do as they please each time a job comes in, or if someone has to run to the boss every time and ask for his instructions, no one knows what will happen. It uses up a lot of valuable time and energy that ought to be put to better use. Everything that is done frequently, over and over again, should be brought down to a system. This done, when a job comes in the man who takes it will know exactly what to do next without asking anyone, and the boss will know just what is being done without giving any special orders on the subject.



It is altogether improbable that a man without experience or without association with someone who has had experience, would attempt to launch a big undertaking. When an inexperienced man starts a garage it is usually on a comparatively modest scale. Therefore he does not need a big, cumbersome system; all he wants is just enough to keep all his transactions straight. And first and foremost he needs something in the way of a record of each job done.

When Differences Arise.

Differences are bound to arise with customers; it is unfortunate, but it is practically unavoidable. And there is nothing more unbusinesslike than for the garage man to be forced to rely upon his memory or the memory of his mechanics, as to what was done on a certain car. It brings the affair to a question of veracity or memory. The customer says, "I say you did this," and the garage man says, "I didn't!" and there they are deadlocked. But if the garage man has something in the way of an authentic record in black and white he does not have to do any arguing. And if he has the customer's signature on his record the trouble will be ended before it starts—and that's just another way of saying that there won't be any trouble.

Follow-Through Tags.

What the customer may say is not the only thing to be considered. The proprietor has his own good reasons for wanting to know as much as possible

Illustrating How Lost Motion in the Spindle of the Drill Press Spoils the Work.

about every job that goes through, without his having to make personal inquiries every time he needs information. He should not have to guess how long it took to clean out the carbon on a given engine, or how long it took to take up the play in the bearings of another, or how many hours and how many men it took to put a new pair of springs in. If the

Digitized by Google

has to guess at these things he will have to guess how much to charge for them, and if he has no way of comparing one man's time with another he never will know when the men are "soldiering." He will not know whether he is charging too much or too little, and if he fails he never will know exactly why it happened.

Proper Tag to Use.

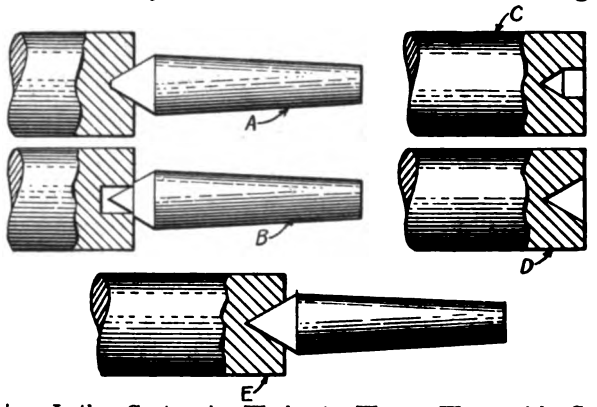
A follow-through tag system, properly handled, is a complete little bookkeeping system in itself, and works very well, whether the garage be a big one or a small one. A good-sized tag is tied to the steering wheel of each car that goes through, and is not detached until the car is ready for delivery. At the bottom of the tag is the job number in duplicate, the lower part of the tag being perforated so it can be torn off and given to the customer. That is his identification card, and it indicates his right to take the car away. At the top of the card is a space for the name, number, make and model of the car, owner's name and address, the date the car is received and the date upon which the work is to be completed. Below this is a space for instructions as to the work to be done.

The owner tells what he wants done and it is written in the blank space and then submitted to the owner, who indicates that it is right by signing. This leaves absolutely no room for question as to whether the customer said this or that, or didn't say this or that. So far as the shop is concerned he did not say a word beyond what was written on the card. If for any reason there is not room on the card for all the instructions the owner wants to give it is a simple matter to have an extra card, in blank, upon which the orders may be continued; but the owner should be asked to sign both cards, and there should be a notation made on each that it is not complete without the other.

The Mechanic's Part.

On the back of the card there are spaces to be filled in with a record of the work, as that work is carried along. When a man is assigned to work on a car the first thing he does is to put his name, the date and the exact time on the back of the tag, followed by the job; per example, "T. Jones, 11—4—17, 8:30 A. M., overhauling starting-lighting system." Then he should tell in detail what he did and how long it took. "Cleaned generator commutator and put in new brushes, 30 min. Cleaned and tightened connections, 20 min.," and so on. If the card is too small the blanks can be used.

Plugging the Leaks.



If it becomes necessary to take any part away to work on it, such as the radiator or the magneto, etc., the man who does the work should mark his time on the card just the same, the idea being, as will be seen, to have all records made at the same place and immediately the work is done, so there will be no strain on the memory and no chance of making mistakes. When the car has had all the attention the owner ordered it will have tied to its steering wheel the owner's order, signed by himself and a record of the performance of every bit of work ordered, together with the time spent on each detail. This makes it a simple matter to make out bills. The cards are filed carefully after the car goes out.

If the customer pays cash the card goes into a file kept for the purpose, and once a card gets into that file it is of no further use except for comparing times on various jobs, etc.; the job has been paid for and therefore it is merely history. In another place are kept "unpaid" cards, which are transferred to the "completed" file as the bills are paid off.

Shop Suggestions.

A considerable amount of trouble, and sometimes serious unpleasantness, may be saved if every car, as soon as it is received, is stripped of everything on it that is stealable. There is no use trying to dodge the truth that there are men everywhere who will not miss an opportunity to pick up things that they think they can get away with. So if everything is put away, carefully listed and checked and replaced on the car when it is ready for the owner, these fellows with itching fingers will just have to itch.

In these days of high-priced machinery it takes a prosperous citizen to install a complete outfit of new machinery in a shop, and even good second-hand machine tools are hard enough to get and hard enough to pay for. In case used machine tools are purchased, or the equipment already installed in a shop is taken over, it is the wise procedure to examine it carefully and make sure that it is in good

Making Lathe Center in Work—A, Wrong Way, with Center Punch; B, Drilling Hole Imposes Severe Wear on Center; C and D, Drilling and Countersinking, the Right Way; E, Proper Method.

working condition. In the accurate work that is required on an automobile good work cannot be done with machine tools that are not running true. The trouble is that a casual inspection will not always reveal anything wrong. There may be no slack in the bearings, and there may still be plenty of room for take-up. There may be no broken parts and no indication of excessive wear. Just the same there may be causes that will lead to trouble the first time close work is attempted.

A Case in Point.

To illustrate the idea there is a little yarn that is true and to the point. A garage man bought a small lathe from a concern that had used it for manufacturing purposes. It had been used on one class of work only, and had been doing, over and over and over again, a job that called for the movement of the longitudinal slide of the compound rest for about an inch and a half only, and only an occasional and very slight movement of the cross slide. The work was chucked, so all the wear the tail stock got was barely enough to take off the stiffness.

Where the Defect Was.

But one spot on the longitudinal screw of the compound rest was considerably worn, and it was all the

Digitized by Google

more worn because the men who had used it had been on piece-work and were more interested in piling out pieces than in keeping up the machine. As long as the worn part was not used the machine seemed to be fine—which it was, all except that part. The man who bought it didn't discover the fault until one day he was doing a particularly close job, and for the first time he ran the rest over the bad spot while making a fine finishing cut. Things went beautifully until the carriage reached the loose place and gave a little jump, leaving a ridge on the job and practically spoiling it.

Centers Not Aligned.

This just illustrates the fact that you can't always tell. The centers of a lathe may be out of alignment so that it will be impossible to turn a job truly parallel without knowing just how much to allow for the error. It is true that in a great many old-fashioned shops the men could do really excellent work on machines that to an outsider would be simply hopeless. They would be so familiar with all their faults that they could allow for them to a hair's breadth and so turn out good work where a better mechanic, perhaps, but one unfamiliar with the conditions could do simply nothing but spoil stock But that sort of thing rarely holds good in the automobile business. If good work is to be done one must have good tools in good condition.

Disadvantage of Lost Motion.

Lost motion is always at least a nuisance, and sometimes it is a good deal worse. An excellent way of showing what it can do is to drill a hole with a drill press having a good deal of lost motion in the spindle. If the spindle is not counterbalanced—and even if it is, maybe—the drill is likely to drop through before it has quite finished drilling and catch. It may be that the drill will break. It may be that the job, if a casting, will have a little chunk of metal ripped out at the surface where the hole comes through. It may be that the drill and the metal both will hold and the job will thrash around on the table. And it may be that nothing will happen except that the drill will tear hard for a fraction of a second, and everything will end all right.

The Factor of Uncertainty.

But with a slack-spindle drill you never can tell just what is going to happen when a drill is coming through. It won't do any harm to add that a great help in working up slack in a spindle is the use of large drills that need grinding, so that excessive pressure has to be applied to make them cut. There are lots of jobs that a man can "bull" through with such a machine; but if he gets a nice piece of work he will put it through in fear and trembling and with much caution and loss of time, or he will turn his back on the drill press and do the job in the lathe, with a loss of time then too.

Little Helpers.

It is actually surprising the number of shops that are run without the help of little ways of doing things that save time and improve results. There are innumerable shops that rarely take any pains in preparing lathe centers in the work. Make a big dent in it with a center-punch—that's good enough! The point of the center has to dig in and finish the work, a job for which it never was intended, and it becomes blunt before its time. Or perhaps the lathe hand takes the trouble to drill a little hole for the point of the center to enter and lets the center make a countersink for itself. This saves the point, but it throws unnecessary and rather severe wear on the center just back of the point. And with both of these methods there is a tendency for the work to loosen up on the centers for some time after starting, which is not conducive to good results. Needless to say the proper thing is to use a small drill and then a countersink of exactly the same angle as the centers, or else a combination tool, which is still better and a good deal quicker.

Cutting Keyways in Lathe.

Cutting keyways on the lathe is something that is often referred to; but there is a man not a thousand miles away from New York City who does that work in an unusually neat, accurate and simple way. He had no elaborate milling attachment; his only special tool was a piece of round tool steel with one end flattened and made a little wider than the diameter of the stock. The flattened end had a V-shaped notch cut out in the middle, giving a sort of fish-tail shape, except that the two edges on each side of the V-shaped notch were straight and square; these were backed off to form cutting edges and the tool was hardened, tempered and carefully edged on an oil stone.

How Tool Is Used.

The shaft to be key-slotted was fastened in the tool-post of the rest in place of the usual tool. It was carefully packed up so that it was truly horizontal and exactly opposite the lathe center. After that all that was needed was to chuck the tool in the lathe and, after moving the shaft up against the tool with the longitudinal slide, work the cross slide until the desired length was cut and then repeat, taking each time a light cut the length of the keyway until reaching the required depth. Properly made and carefully used, the tool cuts beautifully. Of course end mills can be bought to do the same work, but they are quite expensive, and also they are quite easily broken. The little tool described stands up remarkably well and even if broken it is no great matter to re-forge and re-finish it, or even to make a new one.

Facts Worth Knowing.

Many a mechanic does not know what will happen when a copper rivet head in a brake lining comes in contact with a cast iron or steel brake drum. The natural first thought assumption would be that the soft copper would wear away rapidly—but that is just what it doesn't do. It wears, to be sure; but slowly, and in doing so it wears a groove in the drum. It is not safe to give a copper rivet any chance at all at a brake drum. For this reason it is worth the trouble to take pains to make a good job of lining brakes. It is easy enough to drill the lining for the rivets, and after that it is still easy enough to "whang" the rivets with a hammer and bed them down into the lining. The worst of it is that they do not stay bedded, as a rule; they go down a bit, and stay for a while, but spring back or, at best, come into contact with the brake drum after the lining has become but slightly worn. The whole trouble can be avoided by using a countersink. It is possible to obtain a combined drill and countersink, so that the two operations can be performed in the time of doing one, and good results obtained.

Digitized by Google

A Lathe Suggestion.

A very nice finish can be made on a lathe job by taking a very fine finishing cut as follows: Take the last cut before the finishing cut just moderately heavy, and then run the tool back over the job without feeding it in any deeper. The spring will be just sufficient to permit a very light cut, sufficient to leave a fine, polished surface. The tool should be sharp and the work should be run at comparatively high speed and the feed should be very fine for this last cut. A little experience with this trick will enable the mechanic to turn out jobs that look as if they were burnished, and they will be accurate, too. The plan works just as well in boring as in turning.

Negative Economies.

Waste of material has no place whatever in a garage or repair shop. Everything that can be saved and turned to account should be well looked after. It is just as well, however, to be a little cautious. Don't take long strides unless you can see where you are going to plant your feet. There is at the present moment a repairman who is peeved because one of his plans for economizing turned upside down and proved to be an expense. He had been doing a good deal in the way of rebabbitting bearings and though he had made good jobs and the work had stood up well, he rather shied at the price he was asked to pay, and did pay, for new babbitt metal. So after a spell of thinking he gathered up all the old bushings he could lay his hands upon, and next time he had a set of bearings to babbitt he melted up the metal and poured it—or rather, his men did it under his instructions.

'Twas False Economy.

In a week the car was back with the crankshaft pounding like a trip-hammer, and the owner was howling an accompaniment with words relating to the kind of bearings that must have been put into his engines. With his attempt at economy in mind the repairman said nothing, but looked at the bushings when the engine was torn down and also had a talk with the men who did the babbitting. It turned out that the metal had acted queerly when it was melted; some seemed to come to the surface and to refuse all attempts to mix it, and some seemed to refuse to melt when it seemed that it ought to. But the men did the best they could with it and managed to pour it. The man who machined it said it had acted sort of unusual, but he hadn't worried about that, for it was outside of his province.

Where the Fault Lay.

The fact was that the repairman had been trying to handle a special composition designed for die-casting and difficult to handle under any conditions. The aluminum content had separated and refused to go back, while the lead and tin had gone to the bottom and, altogether, the bearings that he made were strange affairs. The moral is to use babbitt that you know how to handle, and that can be handled under ordinary conditions, if you have such work to do. But there is a much broader moral, and that is to find out what lies ahead before you collide with it.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2278 **Would Use a Battery.**

From G. P. Edenfield, Georgia.—I have a new Ford car equipped with a mechanical starter. The lights are not satisfactory and I am considering using an electric storage battery, providing it is not too expensive and can be used successfully. Kindly advise me. I do not want to invest in a lighting and starting system.

Reply.—A storage battery can be used for supplying current to the lamps, but the battery will have to be removed from time to time and recharged. This is one of the disadvantages of the method. If you install a battery you should use lamps of the same voltage as the battery.

2279 **Engine Starts Hard.**

From Roy S. Jamison, Indiana.—I have a 1917 model Ford car which I have driven only about 2,750 miles. This car runs as good as it ever did and develops as much power, but when it is not real warm I can hardly start it at all. The only way I can start it is to just keep spinning it till it goes. I have done the following without the least bit of help. Cleaned carbon out of cylinders, ground valves, cleaned carburetor (the timer is in fine shape), put shellac on cylinder head and inlet gaskets so they could not leak, drained carburetor and sediment bulb, cleaned spark plugs and adjusted same, but still it's just as hard to start. Have always kept engine oiled at the proper level, and the compression is as good as when new. Have gone over the wiring and the connections are all tight and the covering on the wires all good, although soaked with oil at times. The spark seems to be good, and never makes a miss when engine is started. Have the coils adjusted to a scant 1/32 inch, and am at a loss to know what is wrong. Please let me have your opinion on this, as I have done all I can find out to do. This trouble has developed in the last 300 miles.

Reply.—The usual cause of an engine to start under the conditions named is too weak or thin a mixture for starting speeds or a weak spark. A lean mixture will not ignite readily or burn quickly because of the presence of too much air in proportion to the fuel. After the engine warms up a somewhat lean mixture, a homogeneous one, will ignite. Try a slightly richer mixture. If the fault be not

Digitized by Google

the mixture, examine the valve stem guides and valve stems. If there be space between the stems and guides it will permit air to be drawn in, diluting the mixture at cranking speeds. Any air drawn in other than through the carburetor will affect the operation of the engine at low speeds. It may be that the magneto does not develop sufficient energy at cranking speeds to ignite the mixture, or the magneto terminal may be dirty. If you have not cleaned the contact points of the coil, examine them and remove any pits, etc. In adjusting the units of the coil, adjust so that you will not have too much tension on the vibrator springs. With too much tension and a small output of the magneto the vibrators will not operate freely. A simple test for ignition trouble is to connect a set of cells with the coil and note if the engine starts easily. Before starting and after the engine has stood for some time, examine the spark plugs to note if oil has closed their gap.

2280 **Another Mixture Trouble.**

From W. A. Browning, Kentucky.—When an engine is throttled down until it runs without a miss and when it is opened two or three notches on the throttle, what causes it to choke and what is the remedy?

Reply.—The choking may be caused by too rich a mixture, which may be due to extra air being drawn in, as with worn valve stem guides or bushing, worn valve stems or leaks between the intake manifold and the cylinders, etc. If any of these leaks exist the mixture is made richer at slow or idling speeds to compensate for the extra air drawn in. As the speed of the engine picks up the amount of air drawn in through leakage is not in proportion to the flow of fuel from the jet of the carburetor. This results in a rich mixture. A simple test to ascertain if the mixture be at fault is to adjust the carburetor at the speed at which missing formerly took place. If adjustment or cutting down the amount of fuel eliminates the missing or choking, and the engine misses at low or idling speeds, it will tend to indicate that leakage exists. To ascertain if the mixture be correct, note the odor of the exhaust at the speed at which it chokes and at higher operating speeds. If the exhaust be acrid or pungent, it indicates too much gasoline and not enough air. The odor should be what is termed as "sweet." Leakage around the intake flanges of the manifold, carburetor, etc., may be tested by squirting gasoline on the suspected places and noting the effect upon the operation of the engine. Faulty operation of the needle valve of the carburetor can create similar symptoms, although they would be temporary.

2281 **Ammeter Needs Calibrating.**

From R. J. W. Krebs, Ohio.—I have a King Eight equipped with the Ward Leonard lighting system. My ammeter shows discharge of five points when engine is not running and only shows five points when charging when running at full speed. When I bought the car it had 34x4 tires in the rear. I took these off and replaced them with 35x4½. My speedometer is driven from the forward universal joint at the rear of the gearset. How fast am I running when the speedometer shows 15 miles per hour?

Reply.—Your troubles indicate that the ammeter is at fault, out of calibration. This can be easily tested by taking the car to some repairman who has a similar ammeter and wiring it in series with the present ammeter on the car. The fact that the instrument shows a discharge of five points when the engine is inoperative and five points when charging equals the rate of the dynamo, 10 amperes. If the ammeter be not at fault look for a ground or short in the system but this is not probable as you do not state that the battery discharges. The mileage registered by your speedometer will err to the amount of 3.1416 inches each revolution of the rear wheel; that is, the reading will indicate too little by that amount. The 34-inch tire makes 593.2 revolutions in a mile while the 35-inch shoe makes 576.2. Your real speed will be slightly in excess of that obtained with the old tire.

2282 **A Possible Pump Knock.**

From C. R. Burlingame, Michigan.—Have a 1916 490 Chevrolet which has a knock in the engine like a connecting rod knock but which only occurs at each revolution of the camshaft. It seems to occur about midway between the firing of the No. 2 and No. 4 cylinder. Main and connecting rod bearings have been taken up but knock remains. Gearset leaks at front end main bearing. What is the cause for these troubles?

Reply.—The leakage is doubtless due to the small bolts retaining the case working loose. Go over these and tighten. It is doubtful if the noise referred to is caused by the camshaft. Inspect the oil pump. This pump has plungers, and if these plungers wear and a shoulder results a noise similar to that mentioned will be heard.

2283 **Uses Too Much Grease.**

From J. W. Bayne, Pennsylvania.—I have a 1914 King which has been giving me considerable trouble with the grease leaking out of the rear axle on the right hand side. This axle is of the three-quarter floating type and the roller bearing is carried in the wheel hub with a grooved steel washer holding the felt washer. This did not give any trouble until about a year ago. I have installed new King washers also special ones cut for this purpose but the leakage continues. I saw in your paper that a ¼-inch hole bored in the axle housing about 10 inches from the wheel would stop the trouble and have tried it without any improvement. I find that practically all of the grease works out from the differential housing. Any suggested remedy for this trouble will be appreciated.

Reply.—Your trouble is probably due to using too much lubricant; that is, carrying the level too high. There is a plug or lubricant opening in the cover of the differential housing. Remove this plug and drain off all surplus lubricant above this hole. In renewing the supply do not fill above the opening. Use a heavy transmission type of oil. When too much lubricant is used it is churned and worked out as described.

2284 **Piston Inertia and Travel.**

From Frank Cais, Colorado.—Please explain why a piston travels faster when the crank is in the upper half of the crank circle than when the crank is in the lower half. Can you explain this?

Digitized by Google

Reply.—The accompanying drawing shows the four positions of the crankshaft, these being indicated by figures 1, 2, 3 and 4. Figures 5 and 6 are the top and bottom of the piston stroke. Figure 7

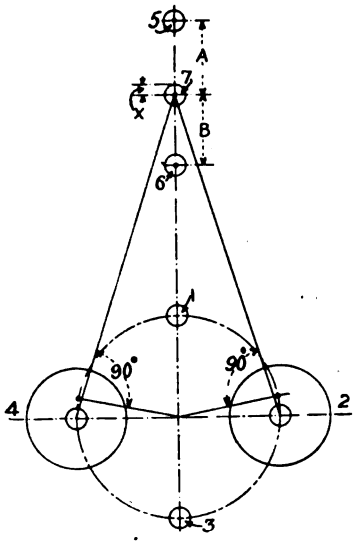

Diagram Explaining Piston Speed Changes.

is the position of mid-piston travel. If the connecting rod were of infinite length all four pistons would reach mid-stroke position and all other points at the same instant. Pistons 1 and 2 would have the same motion as do pistons 3 and 4. With the connecting rod of finite length, however, the positions of mid-stroke and mid-crankpin travel do not coincide, the error being shown at X.

The energy tending to keep the pistons in motion is dependent on their velocity and mass. Owing to the angularity of the connecting rod and the position of the pistons at mid-crankpin travel, piston No. 4, traveling upward, will go beyond half-stroke by the amount X, while the piston going down will travel less than half-stroke by the amount X in the same time, or in 90 degrees of crankpin travel. Therefore, the speed on the upstroke of the piston will be greater than on the down stroke, causing a difference in the inertia of the piston up and down respectively. This difference is a measure of the inertia unbalance and has the effect of an external force equal to the up and down inertia of the pistons. The longer the connecting rod the less X will be, but the amount of this variation can be reduced is slight unless the connecting rod be impracticably long.

2285 Concerning Aluminum Pistons.

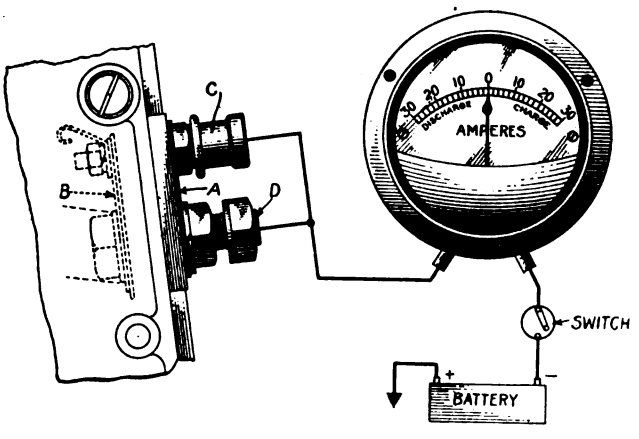
From W. T. Sherman, Rhode Island.—I have a Stevens-Duryea six-cylinder car which I am to overhaul this winter. 1—Will I gain anything by putting in aluminum pistons? 2—Will they throw the engine out of balance? 3—What clearances must I allow on the aluminum pistons, top and bottom? 4—Will the walls and top of the pistons have to be made much thicker than the cast iron pistons and why? 5—What is the aluminum mixture for piston castings as I can have these made in our foundry? 6—How are aluminum pistons finished? Isn't the metal too soft to grind? If they grind them, what is used for a cutting lubricant?

Reply.—1—Advocates of the aluminum pistons claim that in addition to being about one-third lighter they will not score or cut the cylinder walls when extremely hot. It is also claimed that the inertia of the reciprocating piston is reduced approximately 67 per cent., and that this cuts down side pressure, reduces friction and makes for economy of oil. Greater speed and flexibility are also features. 2, 3—The average clearance is .002 per inch of piston diameter. One maker advocates this dimension and .004-inch for each one inch diameter at top of piston with a gradual taper to the bottom ring. 4, 5, 6—Would suggest that you purchase the pistons instead of attempting to cast them.

2286 Will Raise Carburetor.

From R. C. Miller, Florida.—I have been advised to raise the carburetor about two inches by cutting off the intake pipe as the intake manifold is much longer than those on modern cars. I will appreciate your opinion as to the advantage of same.

Reply.—Reducing the length of the intake manifold will bring the carburetor nearer the cylinders where the heat will assist in the vaporization of the fuel. The change will also make starting easier and reduce to a certain extent the tendency of the fuel to be deposited on the walls of the intake pipe. Reducing the length of this pipe will affect the flow of fuel if of the gravity system and this should be taken into consideration in making the change.



2287 Removing Oil and Tar.

From G. F. Mills, Pennsylvania.—What is the best thing I can use to remove road oil and tar from my car?

Reply.—Naphtha or gasoline will soften the material after which the parts can be cleaned as usual. Vaseline is held to be efficient in softening the deposits.

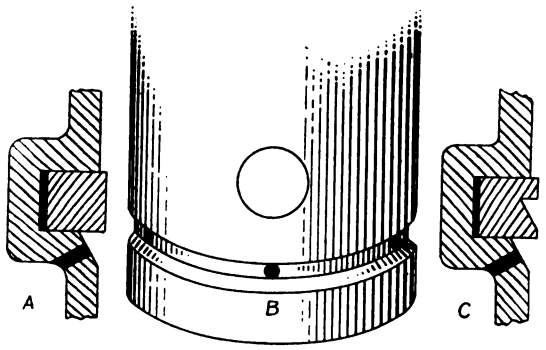
2288 Connecting the Ammeter.

From John F. Parker, Canada.—Could you show me how to connect an ammeter of the type similar to that made by the Ballman-Whitten Mfg. Co. on a 1914 model 33 Paterson car equipped with a Delco Junior lighting and starting system? One side is grounded to the frame. The other is live. There is

Illustrating How Ammeter Is Connected in Circuit of Paterson Car

no ammeter and I cannot tell whether the system is charging or not.

Reply.—The Dayton Engineering Laboratories Co. recommends the following method of procedure. By noting the accompanying illustration it will be seen



Digitized by Google

that a brass strap connects the two terminals C and D. On some machines this strap is inside of the frame as indicated by the letter B and in others on the outside as indicated by A. If this strap is on the inside of the motor-generator it will be necessary to remove the motor-generator from the car and take it apart to cut the strap. Where the strap is on the outside, as shown by A, it can be cut with a hacksaw without disturbing the generator.

After the strap is cut one terminal of the ammeter should be connected to each of the two terminals; the other connected to the switch and storage battery respectively, but left precisely as before. For such an installation it is recommended that the meter be of the "dead beat" type, having a zero center and approximately 30 amperes charge and discharge range. The meter connected in this way will indicate the net charging current, but will not indicate the discharge current taken by the motor during the cranking operation.

2289 **Drilling Piston Ring Grooves.**

From Z. W. Seibert, Ohio.—I have some trouble with my Buick 6 D44 in that oil leaks past three pistons. Before I make any repairs I would like to ask if it would do me any good t install leakproof rings and have grooves turned on pistons and bore six or eight holes in same to let the oil through? If

Remedying Oil Troubles—A, Beveling Ring Groove; B, Groove and Holes; C, Grooving Ring.

so, where should the groove be cut on piston which has three rings above wristpin? If grooves and rings will do any good state where to groove, under the last ring on bottom of piston.

Reply.—The use of the rings mentioned should remedy the trouble provided the rings are properly fitted and the cylinders not scored or out of true. Using grooves and holes is favored by some and when this is done the drilling of the holes below the wristpin as shown at B in the accompanying drawing is recommended. Cutting a slight groove is also favored. A very satisfactory method is to make use of a scraper ring as shown at A. This is accomplished by beveling the bottom corner of the ring groove instead of cutting a special groove in the piston. This will not reduce the piston wall strength. Bore six equally spaced 5/64-inch holes at a 60 degree bevel. If this does not drain the oil back and remedy the trouble cut a small groove in the upper rings as shown at C.

2290 **Used Too Much Fuel.**

From I. N. Brainerd. Michigan.—What say you to this? My car (new) when running slow and not pulling much, has been bucking like a broncho. Never when pulling or running more than 15 miles an hour. Another doctor riding with me said that my mixture was too rich, and got out and thinned it. I have had no buckling since. Does a rich mixture when compressed explode more readily than a lean mixture, so much more readily that the explosion occurs with the piston on the wrong side of dead center, even when the spark is fully retarded?

Reply.—Your mixture was probably rich. Too rich a mixture, too much fuel in proportion to the air, does not burn readily, particularly at low engine speeds. The more perfect the proportions of fuel and air the quicker the mixture burns. The explosion would not occur with the piston on the compression or upstroke with the spark fully retarded even with the mixture referred to. Even with a homogeneous mixture the ignition of the charge would not occur before top dead center, assuming that the timing was normal and the spark lever fully retarded.

2291 **Wants Trebert Engine Parts.**

From A. E. McMurray, Colorado.—I have a Trebert engine the name plate of which reads as follows: "Trebert Gas Engine Co., Rochester, N. Y., No. 249—H. P. 45." I have written to this address as I need parts, but obtained no reply as letter came back marked "Out of Business." Can you tell me where I can obtain parts?

Reply.—We have no record of this company being engaged in the manufacture of engines. Perhaps some of our readers know where spare parts for the engine can be obtained.

2292 **A Question of Economy.**

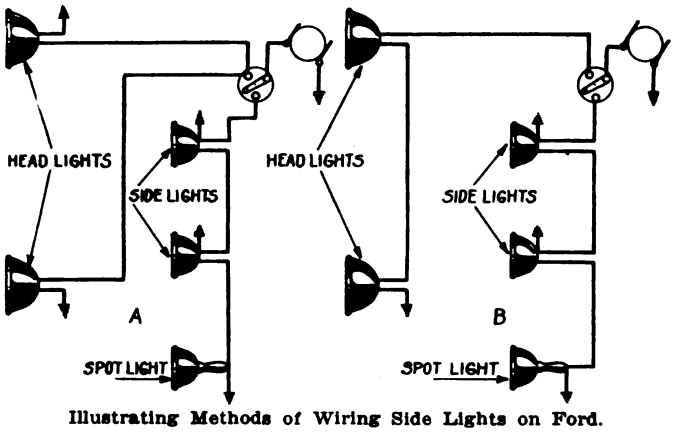
From E. N. Mullis, Iowa.—1—Name the most popular types of headlight lenses. 2—What is the price of the Ford chassis, and can it be purchased without a body? 3—Give the address of one or more firms making a three-passenger body to fit the Ford chassis. 4—Would it be cheaper to buy a piston head or oversize pistons and rings for a Buick engine or would oversize rings do?

Reply. 1—This question is not a practical one to answer. 2—The price of the Ford chassis is $235 f. o. b. factory plus the three per cent. government war tax. 3—Try the Universal Car Equipment Co., 1305 Bellevue avenue, Detroit. 4—We would say that it would be more satisfactory and cheaper to instal new pistons and rings than to buy new cylinder bloc and attempt to use old pistons and rings, or to buy the bloc with new pistons and rings.

2293 **Cause of Clutch Grinding.**

From Leon Savard, New York.—Will you tell me why the dry disc clutch in my 1916 Reo six grinds when disengaging it?

Reply.—The grinding noise is caused by badly worn metal washers on each side of the ball-bearing or thrust bearing of the clutch assembly, and is undoubtedly due to lack of lubrication. These washers are case hardened, and after hardened part wears the balls cut through rather rapidly. Renewing the parts will cure the trouble.



2294 **Wiring Spotlight for Ford.**

From A. D. Horskin, Massachusetts.—Will you supply a wiring plan for a 1914 Ford for a spot light

Digitized by Google

and two side lights and so I can turn a switch and cut out the headlights? Also advise as to what size lamps to use.

Reply.—Two diagrams are presented herewith. That at B shows a series circuit or the way the headlights are connected at the factory. The new model Fords are equipped with an 18-volt magneto and two nine-volt lamps are used in series. Bulbs for the side members should be of similar voltage. The diagram is shown with a ground for each side light

Illustrating Methods of Wiring Side Lights on Ford.

as it is assumed the car mentioned has lamps mounted on a wood dash. The sketch at A shows a multiple circuit, in which the lamps are wired in parallel and with a ground for each. With this type and on old Fords use 12 to 16-volt, one ampere 15 c. p. bulbs. For side lights use 4 c. p. bulbs of similar voltage.

2295 Timing Model 17 Buick.

From George W. Porter, North Dakota.—I like your magazine, as I get lots of good information and suggestions. Can you give me the correct timing of the model 17 Buick engine when the exhaust valve closes and when the intake valve opens and closes? My car is out of time.

Reply.—According to the engineering department of the Buick Motor Co., the exhaust valve closes when the piston has dropped 1/16-inch past upper dead center, and the inlet valve should open when the piston has dropped 3/32-inch past the upper dead center. The company has no record of the number of degrees of the crankshaft angle at which the valves open and close.

2296 Gearing Ford for Racing.

From R. G. Kimball, New Hampshire.—I have a 1912 Ford with a 1914 rear end. I desire to gear this up. I am advised to gear it 2 to 1. Will you kindly advise me as to the new gears I will require and where same can be obtained? I am told I need a new pinion. I have a racing body on the car which holds the road perfectly. Can you give me any information regarding putting in a sliding gearset in a Ford? I would like to know of a practical and economical method. Have a garageman who will help me.

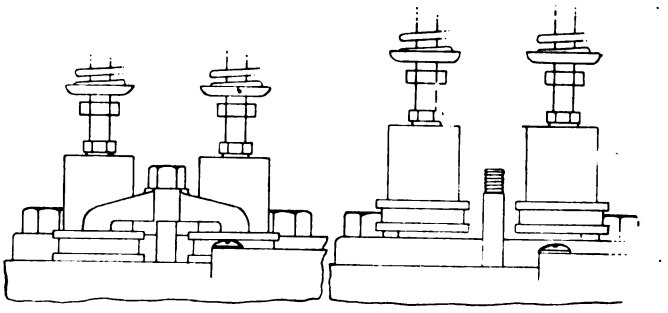
Reply.—The standard ratio of the Ford gears is 3 7/11 to 1. Changes can be made by purchasing the gears, and if you will write William Ganschow Co., Morgan and Washington Blvd., Chicago, Ill., they will supply you with the gears you require.

The ratios to use are as follows: For racing, 2 4/7 to 1. Fast roadsters, 2¾ to 1. For racing on dirt tracks where a quick pick-up is required, use a 3 to 1. The 2¾ and 3 to 1 are interchangeable. You will have to change both the pinion and the large or differential gear, the driving member.

The number of teeth are as follows for the different ratios:

2¾ to 1	gear 36 teeth	pinion 13 teeth
3 to 1	gear 39 teeth	pinion 13 teeth
3 7/11 to 1	gear 40 teeth	pinion 11 teeth
4 to 1	gear 40 teeth	pinion 10 teeth

The average speeds with these gears ratios are: 2¾ to 1, 60 to 65 miles per hour; 3 to 1, 50 to 60 miles; 4 to 1 varies according to weight; average 25 to 35 miles. A sliding gearset or transmission has been brought out by Woodward & Rowe, Chicago, Ill., for the car mentioned. It affords four speeds and is adaptable to all modern makes of Fords. The company will supply you with complete information and prices.



2297 Removing Buick Engine.

From Harry Flowers, New York.—I want to take my engine out of the car to overhaul it. Would like to know if after taking out the four bolts holding it to the frame if the engine can be moved forward by releasing the clutch? In other words, is there anything else that holds the engine? The car is a 1914 model B 25 Buick, a four-cylinder engine.

Reply.—If the clutch is of the cone type you should be able to remove the engine as stated. All wiring, etc., will have to be disconnected. A little study will enable you to determine how best to proceed with the work.

2298 Has a Clicking Noise.

From E., Reno.—My Overland model 83 has developed a clicking noise in the universal joint. It hits about once a revolution. Are these joints hard to take apart? I have a tappet noise and adjusting does not cure it. I have been told it is the pushrod

Illustrating Stirrup and Retaining Members of the Overland Valve Mechanism.

which has become flattened at the lower end. Will it do any damage if left as it is? Can the pushrods be taken out without removing the camshaft?

Reply.—The disassembly of the joint is not difficult. The valve plungers as well as their guides may be removed by displacing the nut retaining the stirrups as shown in the accompanying illustration. The valves will have to be removed, however. No material damage should result from the worn part. It is best, however, to inspect the parts and replace any badly worn.

Digitized by Google

2299 **Would Disassemble Battery.**

From Irvin A. Resh, New Jersey.—If it becomes necessary to take the cells of a storage battery apart for repairs or cleaning how is this done? If the specific gravity is down to 1.150 is it safe to take the elements out of the acid and clean them in clean water? I would like to have full information on this subject. Of course, you will say that this should be done by an expert. Nevertheless, it can do no harm for a layman to know how it should be done.

Reply.—You are correct in your assumption that we do not believe the owner should disassemble his battery. If you desire to learn how the parts go together why not visit some battery service station and witness the work of the expert? This will be much better and cheaper than experimenting with your battery.

2300 **Has Too Advanced a Spark.**

From P. W. Olsen, Nebraska.—I have a 6-40 Chalmers, 32-B model, equipped with the Atwater-Kent K2 timer. Had the engine overhauled a short time ago and since am unable to crank it or start it with the starter on account of its kicking back. When it pulls it has a clicking sound in the timer when the spark is retarded as far as possible. Do you think the trouble lies in the wiring or in the timer?

Reply.—In replacing and adjusting the timer the time of break or interruption of the primary current was advanced or made to occur earlier. Reset or retime according to the timing of the engine. This will be supplied by the agent or manufacturer. In setting this type of timer the click indicates the time of spark. Try timing with the piston at top dead center or the completion of the compression stroke.

2301 **A Question of Speed.**

From J. C. Hallock, Michigan.—My car is a Studebaker, 1916 model, and has been run 9,500 miles. When engine is pulling it runs nicely, but when foot is removed from accelerator engine runs unevenly until engine is again pulling. I thought it was play in the universal. Both joints, clutch and transmission were looked over, but nothing found. Could sufficient wear in axle be the cause of the backlash? It is nothing serious, but is not desirable, and I will appreciate any suggestion you may offer.

Reply.—Your trouble is more likely to be due to faulty ignition, carburetion or valves. The fact that the engine runs well at speeds or with an open throttle and misses at low speeds indicates that either the mixture is too thin or rich at low speeds. Test the ignition and try adjusting the carburetor for the speed at which trouble occurs. Look the valves over thoroughly.

2302 **Has Weak Compression.**

From W. M. Hinkley, Maine.—I have a 1916 Dodge. Lately the engine shows signs of lost compression in the first and second cylinders. Valve grinding does not remedy the trouble. When cranking by hand a hiss of air is heard in the crankcase, so I have made up my mind to install Leak-proof rings. Am I right? If so, can you recommend as good a ring for this purpose as the ring mentioned and at a lesser price, or do you think they are best? If I have to take the pistons out, which is the easiest and best way? Can you give me the address of a concern making a valve reseater and cutter for the Dodge? Am I getting at the seat of my lost compression by installing new rings?

Reply.—If the valves seat perfectly and there is leakage past the rings it will be necessary to inspect the pistons, rings and cylinders to ascertain the fault. If the walls are in good condition the use of the rings mentioned should cure the trouble. To instal the rings the pistons will have to be displaced. The cylinder head is removable and is retained by 14 nuts. The water connections will have to be displaced and the wires disconnected, etc. Removing the lower crankcase will afford access to the connecting rod bearings, and the rods with pistons may be removed easily. The maker of the car has a tool for the work mentioned and which is supplied to its service station. No doubt you could secure one of these by making an application to the factory. The work of refacing the valves and seats can be accomplished with the conventional adjustable tool, which can be secured at any supply house.

2303 **Kerosene and Carbon.**

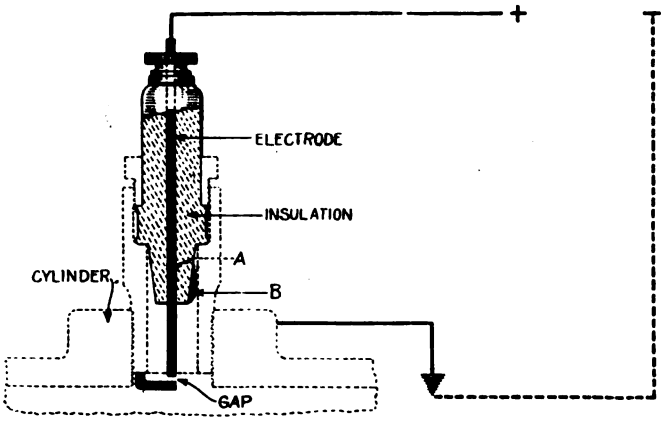
From J. Brenneman, Illinois.—Do you consider it good practice to use kerosene to remove carbon from the valve seats of an engine? The manner of application is to introduce the kerosene with the engine running and through the priming valve. It seems to get rid of the carbon, but I am told that the kerosene gets into the crankcase oil and lubrication suffers.

Reply.—The judicious use of kerosene in the manner described will not do any injury. The amount of kerosene that might reach the crankcase will not sufficiently thin the oil to cause any trouble.

2304 **Looking for Improvement.**

From Frank Johanneck, Minnesota.—I have a 1915 four-cylinder Studebaker which has been run 11,000 miles. I want to equip it with light gray iron pistons and the firm making these pistons claims they can fit the pistons without my sending them the cylinders if I will send the dimensions. Would the pistons fit without getting the cylinders reground? They do not appear to be worn at all. Would it pay to have the work done? The firm making the pistons claims more speed, power, less fuel consumption, vibration, etc. My engine is in perfect condition, never misses and will go from 1½ to 55 miles an hour. To make a long story short, would it pay me to make the change as long as the engine runs perfectly?

Reply.—If you supply correct dimensions the firm can turn out pistons as stated. They can be fitted and used without regrinding the cylinders, provided the latter are in good shape. It would not pay to have the work done if your engine is operating as claimed. If you can obtain the range of speed you state, we would suggest you let well enough alone.



2305 **Path of Secondary Current.**

From E. J. Winebrenner, Maryland.—Who is the maker of the Marvel carburetor and what is his ad-

Digitized by Google

dress? I would like to know what is the cause of the spark plug on my Ford car sparking in the plug as well as at the points when the plug is apparently in good condition.

Reply.—The maker is the Marvel Carburetor Co.,

Illustrating Why Intensified Current Takes Path of Least Resistance.

Flint, Mich. There are several reasons why the trouble exists. It should be borne in mind that the high-tension or intensified current seeks the path of least resistance. Starting from the source of supply to the coil where it is built up or intensified, it is conveyed by cable to the terminal of the spark plug, and passing down the metal electrode it encounters the gap. The current should jump this gap and pass to that electrode attached to the metal base of the spark plug, thence to the metal of the cylinder or ground, back to its source of supply. This completes the circuit. The electrode shown in the sketch is insulated from the metal of the plug. If this insulation was not provided the current would not take the path of the gap, as it would be much easier for the electricity to flow through the metal of the plug or its shell.

This high-tension current acts similar to water under pressure. If there be even a tiny crack in the insulation the current will pass through the crack to the metal part, as there is less resistance than at the gap. This is indicated at A. If carbon or soot, conductors of electricity, form on the insulated part as shown at B, the current is apt to jump across to the metal section of the plug. These conditions are termed a short circuit in that the current takes the shortest way home as it were. When sparks appear as stated the gaps or resistance points are very similar. Plugs in such a condition should be cleaned and tested, and if not in good working condition replaced by new ones.

2306 Has a Ground.

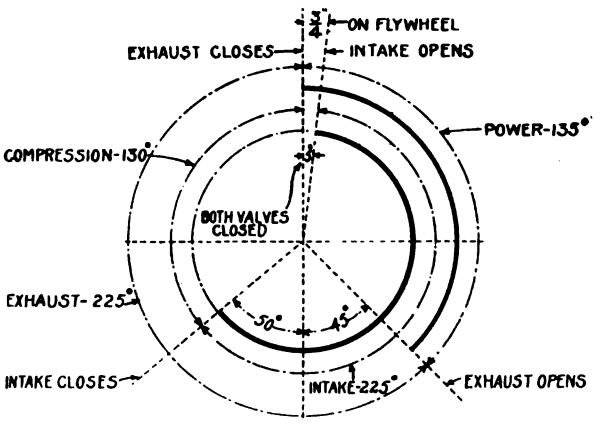
From Henry Kaufman, Louisiana.—I am having trouble with my Ford. I cannot crank (start) it without batteries. It runs all right on the magneto except at intervals. But when I switch on the lights it spits and sputters. I have installed new magnets and coils. The magnets were shipped all bunched together. Could they have become demagnetized by shipping in this manner? You can start by spinning the engine on the magneto when the engine is hot.

Reply.—Would suggest that the magneto be tested and that the wiring be inspected for possible short circuits or grounds. The magnets should not be injured by shipping in the manner stated. They can be tested if in doubt.

2307 Puzzles the Repairmen.

From J. F. Snedaker, Utah.—I have a 1916 Maxwell. When running at 15 miles or above an hour it runs fine, but slow it down to 5 or 10 miles and it jerks considerably. It can't be due to carbon or poorly seated valves, as carbon has been removed and valves ground and new rings fitted. It is not due to plugs or wiring. The compression is good. I have asked a number of repairmen, but they do not seem to know why it acts as it does.

Reply.—There are a number of factors contributing to the trouble mentioned. Too rich or too weak a mixture at the speed at which the trouble occurs will cause erratic operation of the engine. Weak valve springs, particularly the exhaust, and too large a gap at the spark plugs will create missing. Inspect the magneto and note if the contact points require cleaning and adjusting. Go over the wiring to see if any partial grounds exist.



2308 Would Rebuild Old Car.

From G. W. Odgers, New Jersey.—I have a car six years old and the engine is out of date. Would it be good practice to replace the engine with a new one? The wheels, springs, rear axle, etc., are all good. Would it pay to rebuild the car, doing all the work myself?

Reply.—We are of the opinion that the cost of a new power plant and that of installing it would hardly repay you. There is considerable work in installing an engine, as stated, and more or less trouble will be experienced as the work progresses. When the job is completed you will have a car that will not be easily marketed and one that may give you more or less trouble, it depending on the work, etc.

2309 Timing the 12-Cylinder Engine.

From J. D. Burns, California.—Will you please publish the timing diagram of the 12-cylinder engine, the Weideley I think it is called. Please give

Timing Diagram of a Pathfinder Twelve-Cylinder Engine.

the periods of the various openings; that is, compression, firing, exhaust and intake in degrees. If you can, would like to have this in an early number.

Reply.—The accompanying sketch is the timing diagram of the 12-cylinder engine made by the

Digitized by Google

Pathfinder Company, Indianapolis, Ind. As may be noted, the degrees of the strokes are given. The five degrees of the intake opening is equivalent to ¾-inch of flywheel travel, while the exhaust opens 45 degrees before lower dead center or 6½ inches flywheel travel. The intake closes 50 degrees after lower dead center, or 7¼ inches flywheel travel.

2310 Is Hard to Start.

From J. B. Lewis, New York.—I have trouble starting my 1913 Ford runabout on the magneto. The car is in good shape and runs as smooth as new. Have not experienced trouble in starting until recently, during the last three months. It has been growing gradually harder to start on the magneto, and finally it would not start after standing and cooling off. It starts on batteries and runs on magneto after starting. Three different garagemen have looked it over and cannot improve the starting. The car has been taken good care of. In the last five seasons it has been run 15,586 miles. It was overhauled last fall. Will appreciate any information as to the cause of this hard starting.

Reply.—The fact that the engine starts readily on batteries indicates that the magneto or the components of the wiring assembly, etc., are at fault. Test the output of the magneto and see that magneto contact point in transmission is clean. Look over connections between magneto and coil and examine the switch. We are assuming that the engine is not at fault and that the mixture is correct, also that the coils are properly adjusted. It would be advisable to check the gap of the spark plugs, and possibly a smaller gap may help.

2311 Weak Compression and Missing.

From Charles H. Rauschenbach, Connecticut.—I have a Reo that skips very badly. Have come to the conclusion that the trouble is due to a very weak cylinder. Kindly advise me if this would cause missing. If so, would reboring rectify the trouble and would it be necessary to rebore all four cylinders to have the engine run evenly? If the trouble lay with the cylinder would oil be on the plug, or would it be just black and smoky? The plug in the cylinder mentioned is black and smoky, while the others are clean.

Reply.—Very weak compression will affect the cylinder in question. Reboring or regrinding the cylinder and fitting new piston and rings should overcome the trouble. Relative to the balance of engine, we do not believe enough will be removed from walls to effect the balance. It is possible for both oil and the soot mentioned to be on the plug. Oil indicates the use of too much lubricant or poorly fitting rings or scored cylinders. Too rich a mixture will cause smoky deposits, but in your case it is probably the cylinder. Would suggest that the compression be tested, also the seating of the valves.

2312 Magneto Gives Trouble.

From S. B. Tucker, Tennessee.—I have a model 79 Overland with a model A Splitdorf magneto. The magneto has gone wrong. It will not throttle down. It will run at fast speeds, but chokes if you open the throttle suddenly, this with the engine running idle. And when I try to run my car the engine goes dead on the magneto, but when I switch on to the batteries it runs fine. The coil is all right. Have tested it and the wiring. Have cleaned the magneto and contacts and can find nothing wrong. The magnets are all right. The funny thing to me is that it will run idle, but goes dead as soon as I try to move the car.

Reply.—The fact that the engine runs satisfactorily when the batteries supply the current indicates that the circuit breaker mechanism and distributor are functioning properly. If the magnets are in good condition they should develop sufficient current to run the engine throttled down. Try changing the adjustment of the contact points and examine carefully the switch and other connections. Unless absolutely sure that the magnets are in good shape would have them tested.

2313 Sector Works Loose.

From A. Murphy, Indiana.—I own a 1912 Studebaker which is satisfactory in every respect except one, and that is the steering gear. I have trouble in keeping the sector tight on the post. It is a worm and sector type of steering gear and the sector is secured to the post by three rivets. It is impossible to keep these rivets tight. Have tightened them repeatedly and even had the parts welded. We thought welding would cure the trouble, but it has not. Can you suggest a remedy?

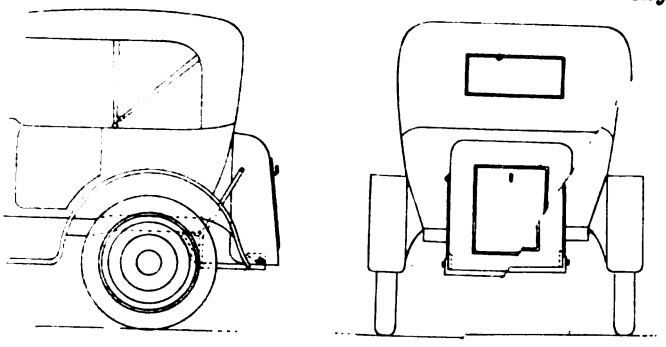
Reply.—From your description it is evident that both the steering arm and sector are worn. As we understand it, the sector is loose on this arm not on the steering column. Bushing the parts and using a key and a taper pin should hold if the work is properly performed. It will be difficult to make the parts rigid if any play exists.

2314 Is Bothered by Backfire.

From W. S. Raymond, Connecticut.—Is there any remedy for my model 31 Buick? It backfires in the muffler for about two miles every morning and after it has stood idle for some time. I have installed new carburetor, new rings and use hot air to the carburetor. The exhaust has a burned smell. Cylinders three and four miss.

Reply.—Symptoms are those of a weak mixture, too much air in proportion to the fuel. A weak mixture burns very slowly. Try cutting down the air until the engine becomes warmed up or slightly increase the fuel supply.

A Cure for Fouled Plugs.



From W. M. Schwingel, New York.—Having profited by various articles in your journal, I will reciprocate. I think if No. 2222, who has trouble with his Maxwell, will use Maxwell oil (which is put out by the Wolverine Lubricants Co., of New York), and recommended by the makers of the car, also use nothing but high-grade spark plugs or at least be sure his plugs are in perfect order, he will have no further trouble. I have a Maxwell of the same model and had the same trouble as No. 2222. A mechanician who looked after my machine had hard work to convince me that my trouble was due to the plugs until he loaned me a full set, with the result my troubles are ended. I, too, thought there was trouble with the rings, but I am satisfied that

Digitized by Google

such was not the case. I could usually drive about 20 miles when the trouble would begin. I would have to clean the No. 2 plug about every five or six miles. I also found that a very small gap in plugs worked better than the regulation thickness of a dime.

Novel Home Made Trunk.

From Neat Tanquary, Texas.—I am sending you two illustrations of how I made use of the rear deck or box of a Ford runabout for a trunk on my

Novel Use Made by Owner of Rear Box or Deck of Ford Runabout. It Provides a Roomy Trunk at Little Expense.

Hudson 6-40. I took a piece of 2x4 and placed it as shown in the illustration and bolted the wood down to the trunk rack. The box is supported by two irons, one on either side, and running from the trunk rack as shown. These irons should be painted the color of the body and varnished to make a good job. The box is not only light, but I find I can store a considerable amount of stuff in it. The idea may not be original, but it is new around here.

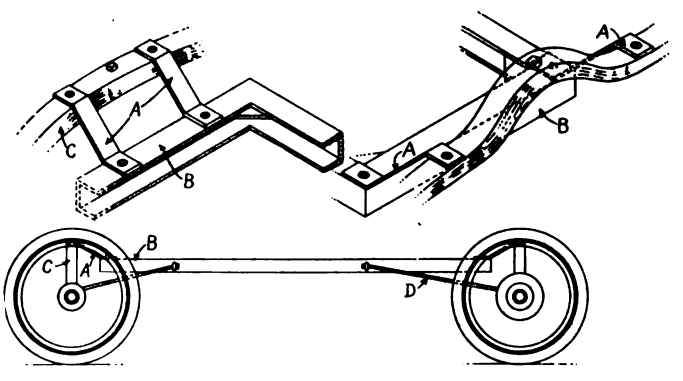
A Remedy for Leaking Axles.

From Samuel Francis, California.—I am a reader of your magazine and find it very interesting to read the different articles printed for the benefit of motorists. I am contributing an article dealing with the leakage of grease through the hubs of the rear wheels of automobiles, and hope it will interest your readers. As we all know, the trouble is generally caused by having an excess of grease in the differential. So many complain about the Ford leaking grease. I have found other makes of cars are troubled the same way if too much grease is kept in the differential casing, which is likely to happen with the novice.

The most satisfactory method I have experienced is to drill two 1/8-inch holes close together on the under side of rear axle tubing and on each side of the differential, say about 12 or 15 inches from the center line of gear casing. Leave these holes open all the time, as no dirt will enter, as the holes will be full of grease running out.

Cures Trouble by Heating.

From H. J. Ripper, Pennsylvania.—I am always waiting for the Automobile Dealer and Repairer and am glad when it arrives. It has helped me out of many tight places. I notice that Henry Lobeck, No. 2222 and his oil trouble. I have an E. M. F. 30, 1911 model. Two years ago I installed new rings in the third and fourth cylinders for the same cause, but they did not help. By accident when in a hurry one day I left without a drop of water in the radiator and it was not noticed until I had driven about two or three miles. I had to go another mile before I could get water. The engine was good and hot, you can bet, because I was mad and in a hurry. Now don't laugh, but I filled her up as soon as I stopped, but filled the radiator very slowly. And I haven't had any oil trouble in the third and fourth cylinders since last winter. I put new rings in the other cylinders and had the same trouble, oil, then some more oil. I decided to try the no water cure. I took a supply of water with me and two of my boys and we started with no water in the radiator. And we just ran the old tub until she commenced to buck and jerk. When we stopped we had gone six and one-half miles at a speed of 20 miles an hour. Before this the cylinders were always covered with oil, but now they are not. And what is more I can go up grades on the high that I could not before and I have not found anything injured by the operation of the "no water" treatment. I have some more things to tell, but not at present.



Ed. Note.—We do not advise the use of Mr. Ripper's method. While an engine can be operated for a brief period without water and provided there is plenty of oil, one is apt to invite serious trouble. The effects of overheating an engine are too well known for further comment.

Suggestion for Starting.

From C. E. Hubbard, North Carolina.—To start a car on a cold morning dip a rag in boiling water and lay it on the carburetor and intake pipe. Pour some of the hot water on it and let it stand five minutes. The engine is then ready to crank. This method has never failed me.

Lowering Ford Frame.

From William Spooner, Rhode Island.—Am sending you a sketch of how I lowered the frame of my Ford so as to obtain a lower center of gravity when driving at high speeds. This plan drops the front of the frame about six inches, and the frame is held in position by the two L-shaped bars A. One end of the bar members is bolted to the frame as shown

Showing How a Reader Lowered Frame of Ford.

at B, and the other is fastened to the spring section as indicated at C. This will, of course, make it essential to lengthen the front radius rod so that the bars L won't touch the axle. The rear of the frame will have to be altered. It is necessary to cut off about six inches of the frame and the support is replaced by the members D, which must be

Digitized by Google

cut to the right length and so as not to increase the wheelbase. If the wheelbase is increased one will have to lengthen the drive shaft. This is why one must be careful to have the bars of the proper length.

Plugs Holes With Shells.

From Lea Moore, Delaware.—In scraping carbon from the cylinder heads of the Ford, plug the water jacket holes with 22 calibre rifle cartridges, used shells, and the cylinder head bolt holes with 32 calibre, rifle or revolver. I find this much better than rags, as the shells cost nothing and can be used over and over again.

UNITED STATES WANTS REPAIRMEN.

Soldier Workmen Needed for Overseas Service in the Repair Shops of the Army.

Back of the fighting front of the American army in France there will be established warehouses and repair shops for handling vast amounts of ordnance equipment. General Pershing is very anxious that these shops should be established at the earliest possible moment. A division of the Ordnance Department of the United States army, known as the American Ordnance base depot in France, will be in charge of this work. This division will be a military organization, all of the men in it to be soldiers of the United States army under military discipline.

Men are needed to enlist in this division, not as fighters but for overseas service as skilled or unskilled soldier workmen. About 9,000 men will be required at first, and of these about 2,000 are expected from the Chicago area. The Chicago office for this recruiting is at 435 South Dearborn street and is in charge of the Ordnance recruiting committee of the Military Training Camps Association.

Men between the ages of 18 and 40 will be enlisted for the duration of the war as privates, but there is opportunity for promotion to higher grades. They will receive free quarters, rations, clothing, bedding, medical and dental attendance, and pay ranging from $30 to $61.20 a month. Men with minor physical defects may be accepted. Men of almost every vocation and trade are needed, particularly automobile repairmen, cooks, gunmakers, harnessmakers, machinists, millwrights, optical instrument repairers, painters, steel polishers, plumbers, etc. In addition to the headquarters at 435 South Dearborn street, information can be obtained from any United States army recruiting station.

At present men who are exempt from the National army, under the provisions of the selective service draft, cannot be accepted for this division. But men over or under draft age or men of draft age not yet ordered into camp, may be accepted. Wives or dependents are provided for. The wife receives half of husband's pay, plus $15 a month, plus $10 a month for one child, plus $5 a month for each additional child.

AWARD SPACE AT BOSTON.

Motor & Accessory Manufacturers' Association Gives Out Locations to Members.

The first allotment of space at the Boston show has been made by the Motor & Accessory Manufacturers' Association. Twenty-nine members have been given places, and although many have taken large areas there is still room for additional members who may desire to obtain space before the show opens on March 2. Although New England members of the association are well represented, New York, Pennsylvania, Illinois and Michigan manufacturers will display their products. The first allotment is as follows:

Auto Pedal Pump Sales Corp., New York City.
Brunner Mfg. Co., Utica, N. Y.
Century-Plainfield Tire Co., Plainfield, N. J.
Champion Ignition Co., Flint, Mich.
Corcoran-Victor Co., Cincinnati, O.
Corning Glass Works, Corning, N. Y.
Detroit Pressed Steel Co., Detroit, Mich.
Dixon Crucible Co., Jos., Jersey City, N. J.
Du Bois Piston Ring Co., Inc., Albany, N. Y.
Electric Storage Battery Co., Philadelphia, Pa.
Gray & Davis, Inc., Boston, Mass.
Halladay Co., L. P., Streator, Ill.
Harris Oil Co., A. W., Providence, R. I.
Hartford, Inc., Edward V., Jersey City, N. J.
Kellogg Mfg. Co., Rochester, N. Y.
Kelt Mfg. Works, Atwater, Philadelphia, Pa.
Mal Co., F. W., Milford, Mass.
Meta Stamping Co., Long Island City, N. Y.
Mosle & Co., A. R., Mt. Vernon, N. Y.
Moto-Meter Co., Inc., Long Island City, N. Y.
Piel Co., The G., Long Island City, N. Y.
Rand Mfg. Co., Inc., Haverhill, Mass.
Rowe Cal. Co., Hartford, Conn.
Schrader's Son, Inc., A., Brooklyn, N. Y.
Syracuse Malleable Iron Works, Syracuse, N. Y.
Vacuum Oil Co., New York City.
Veeder Mfg. Co., Hartford, Conn.
Warner Lenz Co., Chicago, Ill.
West Side Foundry Co., Troy, N. Y.

IS FINANCIALLY SOUND.

Chalmers Co. to Continue Production in Large Quantities, Says President Flanders.

The Chalmers Company has issued a remarkable statement over the signature of President Walter E. Flanders of the Chalmers and Maxwell companies. To show that the Chalmers concern is sound financially the company has authorized its distributors to state that it will post $200,000 to back up the prophecy that the Chalmers company under the Maxwell management will stand ahead of 15 producing companies and making cars selling between $1,100 and $1,500 in 1918, and ahead of 20 of these companies in 1919. The statement is authorized to show the purchasing public that Chalmers cars will be continued to be marketed and in increasing numbers.

Disteel Wheels for Motor Cars.

The Detroit Pressed Steel Co., Detroit, Mich., which is manufacturing a very interesting type of metal wheel for the passenger car called the Disteel wheel, is issuing an unusually attractive de luxe brochure showing the use of its product on various makes of machines. No expense has been spared in the art work, material or printing, and as many as eight colors are utilized in the illustrations. The method of changing the wheels and the ingenious demountable feature of the Disteel wheels are clearly shown, and the sketches are so clear that explanatory matter is not required, although

New Oil Field Opened.

A new oil field has been opened about eight miles from Los Angeles, Cal. One well put in by the Standard Oil Co. is flowing about 7,000 barrels a day, of 24 gravity oil, from a depth of about 1,000 feet.

Explaining the Operation of Various Types of Engines and How the Construction of Cylinder Heads is Varied

BY AUGUSTUS A. WEST, M. E.

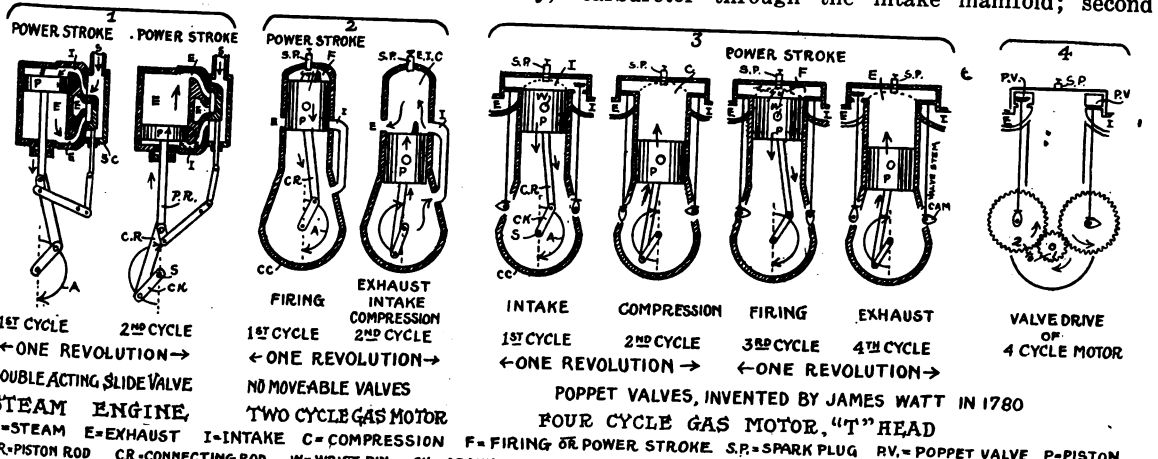
A mixture of gas vapor and air is burned in the cylinder of the gasoline engine, the heat thus generated being converted into useful work by the expansion of the products of combustion. The action in gas, oil and hot air engines is very similar.

An accompanying illustration shows a comparison of the steam and gas engine of the two and four-cycle type. In the steam engine each stroke is a power stroke, the steam acting alternately on each side of the piston. This double action does not work well in the gasoline or internal combustion engine, as it is called, because of the great heat that results from the explosion, so a "trunk" or single-acting piston is used.

Various link steam valve movements are used in steam engines, and we have shown the type used in steam pumps, which does not permit of using a variable "cut off," such as is used in locomotives and other power steam engines. There are two great properties in steam, one being the velocity, the other the expansion, the latter being obtained by the "cut off." Steam has a third benefit obtained by "condensing" or decreasing the space occupied by cooling the steam and turning it back to water, which causes a vacuum pull on the piston. A steam engine has a steam velocity and expansion push and a steam condensing vacuum pull. If the exhaust gases from a gas engine were rapidly cooled there would result a vacuum pull on the trunk piston. The muffler of the gas engine acts the reverse of a steam "condenser" in that it retards the flow of the exhaust gas and puts a back pressure on the piston, hence more power is obtained when the muffler is eliminated, but more noise results.

The Two-Cycle Motor.

The two-cycle gas engine gets a power stroke every alternate stroke or cycle, it has no movable valves, gives about 60 per cent. more power than the four-cycle in the same time space, but has a number of disadvantages. The two-cycle engine is limited to about 900 revolutions per minute because of the small time space in which it can intake and exhaust gas, resulting in fouled gas in the cylinder. In the two-cycle engine the gas from the mixing valve or carburetor goes into the crank case, where the downward stroke of the piston partially compresses it. The mixture goes into the cylinder and during the time of exhausting the burned gas. There is a dividing wall on the head of the piston which is supposed to separate the incoming fresh gas from the outgoing burned gas.



Four-Cycle Engine.

The modern automobile engine is the four-cycle. Four and six upright cylinders are used, also eight and 12 cylinders in V shape or set 60 to 90 degrees apart. These engines run as fast as 3,500 revolutions per minute by using small diameter, light-weight pistons and reciprocating parts. The four-cycle strokes are: first cycle, gas intake from the carburetor through the intake manifold; second cycle, the piston compresses the gas mixture; third cycle, the compressed mixture is fired; fourth cycle, the exhaust.

Six-cycle gas engines have been built, the first four cycles being as above, the fifth drawing in cold air and the sixth forcing the air out. This method of scavenging the cylinder results in a loss of power and time and is seldom used nowadays.

The poppet valve is in most common use. In some modern motors two intake and two exhaust poppet valves are used. Other forms of valves are used, such as Knight's sleeve valve, and disk and rotary valves. The poppet valve is operated by a cam on a camshaft, driven at one-half the speed of the crankshaft. There are air-cooled and water-cooled gas engines, the latter predominating.

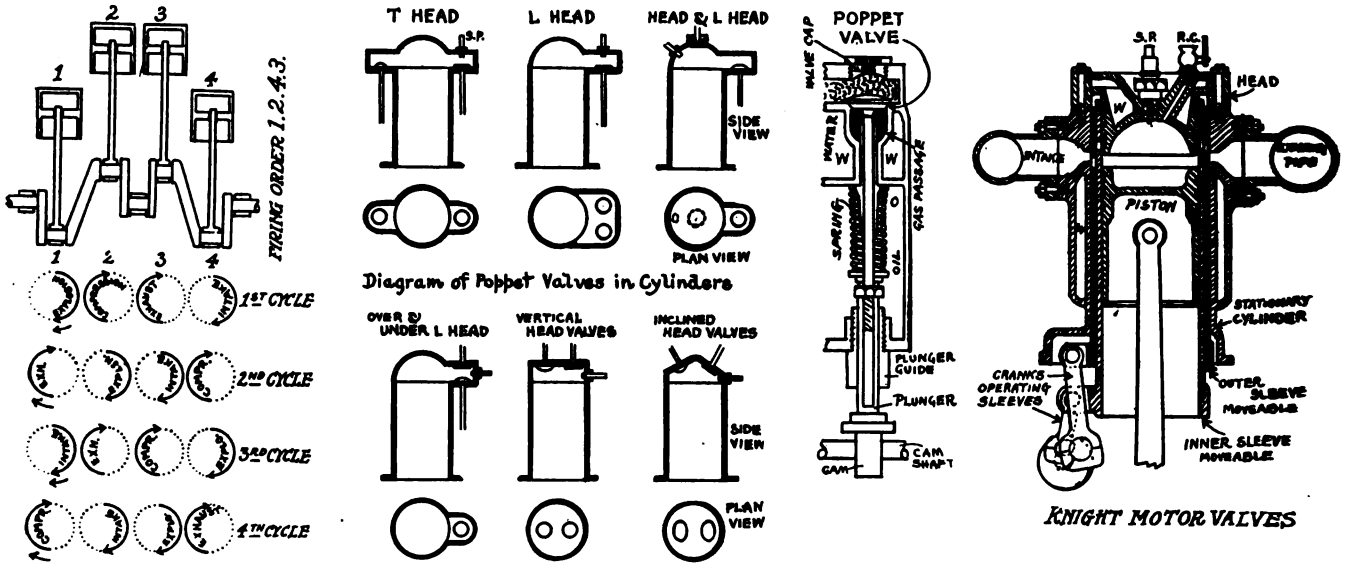
An accompanying illustration shows how an explosion or power stroke is obtained each half revolution when using four cylinders. If two double-acting pistons were used there would result the same

Illustrating the Operation of the Two and Four-Cycle Internal Combustion Engines.

Digitized by Google

power as obtained from four single-acting pistons, but there are structural difficulties in using double-acting pistons.

A study of the cycle of operation shown will give a clear idea of the power action of the four-cycle, four-cylinder engine. The cranks are set at 180 degrees, or one-half of a circle. By using six cylinders and three cranks set 120 degrees apart there results an overlap of power, and by using eight or twelve cylinders there results a more continuous application of energy. If twelve cylinders were placed in a line, a long crankshaft and hood would be required, so that designers resort to the V placing of cylinders in eights and twelves.



The power of the gas engine depends also upon the piston displacement, the number of times per minute the piston travels back and forth, etc. Many other factors enter in the power factor so that actual operating tests differ from indicated horsepower. Some designers double the number of intake and exhaust valves of the poppet type. Two intake

Various other types of gas engine valves have come and gone and the end is not yet. The refinements of the gas engine are in the minor parts, especially in the valve mechanism. In automobiles the two-cycle type has given way to the four-cycle, the air-cooled to the water-cooled, the one and two-cylinder to the four and six-cylinder, and modern practice points to the V type of eights and twelves.

The Lenoir Engine.

In a brief resume of the history of the gas engine we find that the Lenoir engine appeared about 1860 in France and was much used in both France and England but not for automobiles. It was a double-acting engine, built very much like a steam engine and had a valve chamber much the same as the steam chest on the steam engine.

In 1862, a French engineer, Beaude Rochas, suggested a piston power travel entirely different from the steam engine. The mechanical difficulties of the Lenoir engine were carbon deposits, piston rod pack-

Showing the Different Types of Cylinder Heads and Illustrating How the Poppet and Slide Valve Engines Differ.

and two exhaust valves means sixteen poppet valves with a four-cylinder engine.

An accompanying illustration shows various forms of poppet valve and their location in the cylinder. Other types of valves are used with varying results. Prominent among these is the Knight sleeve valve, shown in the illustration. In this valve system there are two long sleeves or movable cylinders worked by eccentrics. The inner sleeve acts as the piston cylinder and is surrounded by an outer sleeve. Both having an up and down movement. The sleeves have slots forming intake and exhaust openings as they pass each other and the slots in the stationary cylinder. As the sleeves move in opposite directions their friction speed is doubled, but this is taken care of by oil grooves supplied by an oil pump.

The silent action and large gas ports make the Knight valve efficient in carefully built engines. Continued operation is said to benefit its efficiency, which cannot be said of the poppet valves. The water cooling of the Knight is through the stationary cylinder, the outer cylinder or sleeve, thence through the inner cylinder or sleeve and then to the piston. The cylinder head is a separate casting.

ing troubles and valve troubles. The Rochas and the Otto engines made use of the four-cycle principle and a trunk or single-acting piston.

About 15 years ago the gasoline automobile came into commercial use with one cylinder, then came the two-cylinder, horizontal opposed motor, which gave way to the present four-cylinder upright type. Four cylinders are used because of the more continuous power impulse obtained. The cylinders are numbered in rotation 1, 2, 3, 4, and the cranks of Nos. 1 and 4 are up while the cranks of Nos. 2 and 3 are down and the firing orders are 1, 3, 4, 2 and 1, 2, 4, 3.

Locating Leaks.

Locating minute leaks is a simple matter if a mixture of soap and water is employed. Soap suds will be found to be exceedingly useful for locating puzzling punctures in inner tubes, for ascertaining faulty connections in the pressure fuel system, exhaust line, etc. Apply the soap suds with a brush. Any leak will be instantly noted by the bubbles given off. This method is successful where the usual treatment fails.

TRUCK SALES POSSIBILITIES.

Suggestions for Investigating Conditions by Dealer Contemplating Agency.

BY F. L. MEAD,
Sales Manager Dearborn Motor Truck Co.

Wonderful possibilities exist for the wide-awake dealer who has been fortunate enough to secure an agency for truck units, and better still for those who have taken exclusive territories for the sale of these units, for the day is fast approaching when every small town and hamlet will see the development of motor truck for hauling purposes. This condition is being fast brought about by the unprecedented publicity given in almost every magazine, newspaper and periodical at the present time.

These publications are pointing out the advantages, economy and efficiency of motor truck hauling over horses, urging business concerns, merchants and farmers everywhere to adopt this method of transporting their product, for their own good, as well as the general good of the public at large. It means lower food cost, less hauling expense, better service and a quicker means for marketing the product.

Possible Profits.

Dealers should be quick to take advantage of these conditions and prepare to reap the benefits bound to follow this wave of publicity. It opens up an avenue for the dealer for the disposal of used cars he is compelled to take in trade by converting these cars into one or two-ton trucks and disposing of the completed truck at a handsome profit. It affords the dealer an opportunity of suggesting to the owner of a dilapidated looking passenger car a means of converting his car into a truck and the purchase of a more up-to-date passenger car for his own use.

Dealers contemplating an agency can easily investigate conditions in their local territory, assuring themselves that such a market exists. This can be accomplished by calling upon a few business men and farmers and getting their opinions regarding the use of trucks in their own business; also interviewing owners of old cars who are endeavoring to trade them in on new ones and ascertain whether or not they would consider converting their used cars into trucks at a reasonable cost and a slight charge for attaching same.

How to Secure Sales.

The best method for determining sales possibilities is for the dealer to equip himself with a demonstrating truck, place it on display at his place of business and use the local newspaper for the announcement of the motor truck agency. This demonstrator can be used on the streets as an advertising feature and when the opportunity presents itself it is well to call on the merchant or business concern with the request that the dealer be allowed to give them a practical hauling demonstration for a comparative test over their present horse-drawn equipment.

At various periods the demonstrator can be run into the country and exhibited to the farmer, showing him the many uses to which it can be put around the farm as well as for hauling his product to market, thus relieving his horses and men for more important work. Nearly every farmer has an old passenger car which can be converted, and this would eventually lead to the sale of a new passenger car to take the place of the old one.

Making Truck Pay.

Numerous instances have occurred where the dealer has rented his demonstrator for hauling purposes which paid him a handsome profit over its cost and at the same time closed actual sales for other trucks. The business man using a motor truck once is soon convinced of the many advantages it has over horses for hauling purposes and is ready to purchase.

Manufacturers of truck units have their own methods of allotting agencies, and it would be well for the dealer to investigate and accept the one whose reputation is established and the merits of their product beyond question, also to ascertain to what extent parts are carried in stock and how promptly same can be supplied.

No dealer in motor trucks or truck units renders free service to customers beyond a short period of time after sale is made, but a nominal charge is made to cover the cost of keeping the truck in good condition, which the customer is only too glad to pay.

The manufacturers of truck units are always ready to make good any defective material or workmanship on the unit for a period of 90 days from date of delivery, and the dealer can use this feature in closing his prospect on the sale of truck units. Complete literature and advertising is generally furnished the dealer taking an agency, and a request from the dealer contemplating an agency will bring full particulars.

Trucks Beat Railroad's Time.

The economy of trucks was demonstrated recently when a machine saved three hours in time and $2.89 per man in transporting 18 soldiers and their marching equipment over a 135-mile trip, as compared with a special train. The men were transported from a fort at Atlanta, Ga., to another fort near Chattanooga, Tenn. A test made of the truck service over the same route and carrying supplies demonstrated the concrete value of the commercial vehicle in war service, as well as that of the Dixie highway, over which the machines travelled.

Goodrich Truck Book.

Announcement is made that the 1918 edition of "Motor Trucks of America," of which S. V. Norton, manager of truck tire sales of the B. F. Goodrich Rubber Co., is the author, will be ready for distribution on January first. The book, consisting of 200 pages of reading matter, illustrations and specifications, is the sixth to be issued in as many years. It is hand sewn and of heavy binding.

Complete specifications of nearly 150 of the leading gas and electric-driven motor trucks are contained in the volume. There are thirty-one specifications for each model. These details are absolutely dependable, as the approval of each truck manufacturer is obtained before specifications of his model are inserted. For the reason it offers opportunity to the buyer and manufacturer to compare models, lists all makes according to sizes and affords a perspective on changes of design by comparison with previous editions, "Motor Trucks of America" is accepted throughout the motor world as one of the authentic handbooks of the truck industry.

Patriotism to Be the Keynote of Exhibits and Decorations at the New York Show.

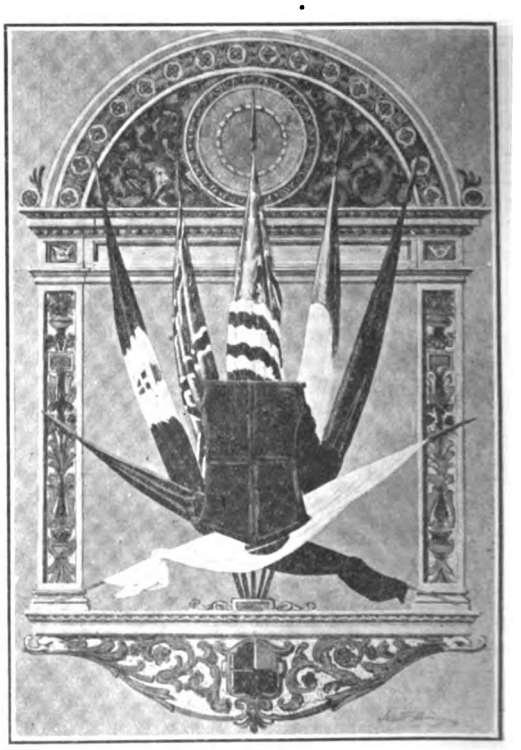
Flags of the Allies, Old Glory and Liberty Shields to Greet Visitors.—Many New Devices and Inventions to Be Shown.

Plans for the national automobile shows to be held in New York and Chicago indicate that the 1918 exhibitions will surpass all previous efforts. The New York show will be held in the Grand Central

Samuel A. Miles, Manager of the Show.

Palace during the week of January 5-12, while the Chicago exhibition will be held in the Coliseum and Armory from January 26 to February 2. Both expositions will be held under the auspices of the National Automobile Chamber of Commerce and will be managed by Samuel A. Miles.

Every bit of exhibition space in the show buildings has been allotted to makers of cars, parts and accessories, and many very interesting products will be shown, some for the first time. In all there will be 86 different makes of cars and 260 accessory displays at the New York show, and a like number will exhibit at Chicago. More than 300 new, glistening models of automobiles ranging all the way from tiny runabouts selling for a few hundred dollars to the largest, roomiest limousines costing more than $5,000 will be shown. Among the exhibitors are several makes of electric cars and steam cars.



From present indications an unusually large number of out-of-town visitors will be in New York for the show. Already the hotel men are making special plans for the accommodation of visitors.

While the cars themselves will be the main attraction, there undoubtedly will be much interest displayed in the accessory and sundry line, and two of the four floors used for the show will be used for these exhibits. The bulk of this space will be occupied by members of the Motor and Accessory Manufacturers' Association. Many of the devices and inventions promised for the show are absolutely new. New starting and lighting systems, horns, wire wheels, magnetos, carburetors, transmissions, engines, castings, tachometers, wind shields, etc., nearly all of new or improved design, will be displayed.

Manager S. A. Miles has spent much time in devising a decorative scheme quite different from that of other years, as this is America's first wartime show. Realizing what an important part the automobile is playing in the war, it is but natural that a patriotic tone should be given to the exhibitions and the decorations. The flags of the Allies and Old Glory will predominate in the decorations. Shields representing "The Flame of Liberty," upholding the flags of the Allied nations will be used to decorate the gigantic pillars on the main floor of the building.

The lattice work and plaster cast of former years have been entirely discarded, and in their places will be found a higher degree of art, the work of artisans in various artistic pursuits. Mural paintings, hundreds of them, will be used throughout the entire four floors of the building to resemble tapestry hangings. On the main floor the windows will be decorated by specially made curtain effects having the appearance of tapestry. These will be painted on transparent material affording plenty of opportunity for the light to come in, and will be hand painted in the designs of the standards of the various Allied nations. At the base of the windows will be boxed plants and flowers.

There will be special features during the New York show. Thursday, January 10, has been set aside as S. A. E. day. During the day the society

Shields Representing "The Flame of Liberty" Will Be Used on Pillars.

will hold a big session and in the evening the members will hold their annual banquet at the Biltmore. The Motor and Accessory Manufacturers' Associa-

Digitized by Google

tion will hold several meetings during show week and, like the National Automobile Chamber of Commerce, the association will hold its annual banquet at the Waldorf during the week.

TENDENCY IN DESIGN.

What the Visitor at the Show May Expect in the Way of Improvements and Innovations.

BY CHARLES E. DURYEA.

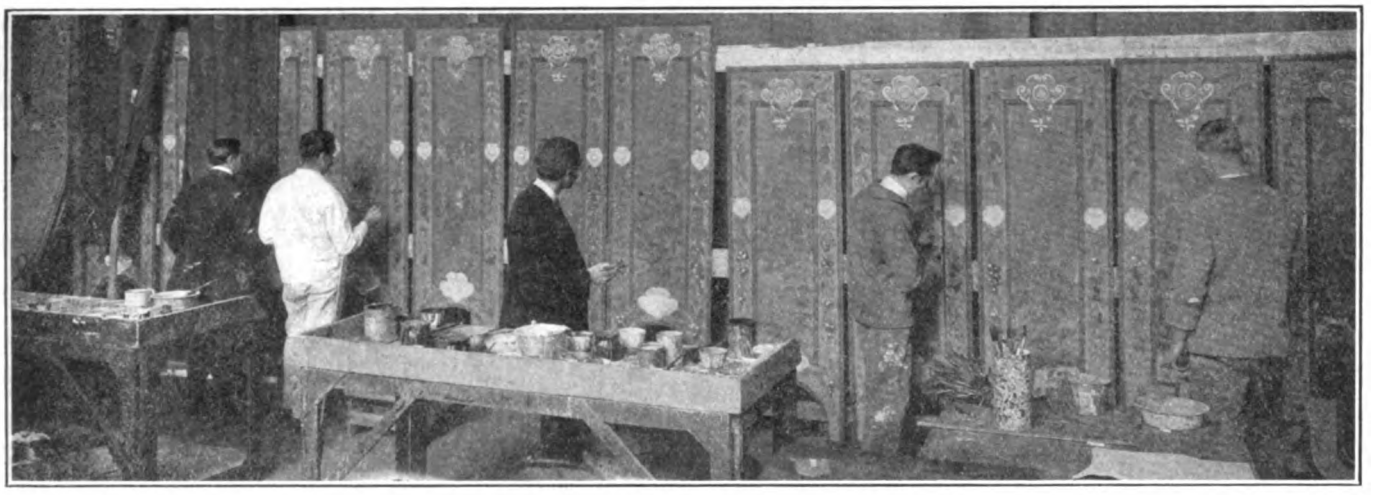
Those who have followed the development of the motor vehicle look forward to the annual exhibition at New York with interest. Radical departure from conventional engineering practice is not to be anticipated for the designer cannot very well offer other than refinements in design and slight improvements in certain components of the chassis.

Economy the Keynote.

The splendid work being done by the power vehicles in many—one may almost say all—lines undoubtedly will be shown and much information not well known to the public will be brought out. Conservation will attract more attention than ever before, as for example heaters for the carburetor or the supply pipe or the air inlet do much to make the fuel vaporize more readily and completely thereby insuring proper burning and maximum development of the engine's power. These devices vary from an electric coil in the carburetor bowl or manifold to a complicated stove heated by the exhaust from the engine. Never before has there been such a variety of this type of improvement. And it is most timely for while we still have ample fuel to take care of our needs even in war times we are at the point where wastefulness is culpable.

Regulating Engine Temperature.

It is also being recognized that there is no advantage from saving fuel if the heat produced is wasted instead of being used. So we find an ever-increasing number of devices for preventing overcooling of the engine. Thermostats in the water pipes to slow down the circulation as the water gets cooler; shutters in front of the radiator to shut off the air draft when not wanted; fan regulators to speed up the fan when needed; water pumps that only pump when hot, and similar devices are now being used to keep the cylinders working hot and yet prevent them from becoming too hot. With modern fuels the cool walls of the cylinders condense the heavy fuel parts and send them down to the crank case where they are wasted so far as being burned is concerned, but where they also become a danger because they affect the lubricating oil.



Annual Motor Boat Show.

Automobilists and the trade interested in the motor boat industry will have opportunity to note the progress made in marine engines, etc., at the fourteenth annual motor boat show, which is scheduled to take place at the Grand Central Palace, New York City, January 19-26. It is predicted that the show will surpass all previous exhibits and that more high-powered engines will be exhibited than heretofore.

War Tax to Hit New York Show.

The war tax will apply to tickets at the New York show. The general admission will be 50 cents plus the 5 cents tax, and the only persons who will be admitted free will be those actually employed by exhibitors and working in the show.

A plan has been worked out by the National Automobile Chamber of Commerce whereby manufacturers may themselves assume the tax on tickets that they distribute, thereby still making it possible for them to distribute tickets that will cost the recipient nothing to use. Season tickets given the members of the N. A. C. C. and M. A. M. A., will cost the users 5 cents each day of use. Single admission passes, on which no tax has been paid, will cost the user 5 cents each.

Artists Constructing and Painting Decorative Panels and Mural Paintings to Be Used in Grand Central Palace.

Will Exhibit Body Designs.

The annual Automobile Salon will be held January 2 to 9, inclusive, in the ballroom of the Hotel Astor, New York City, and in the Elizabethan room of the Congress Hotel, Chicago, January 26 to February 2, inclusive. Space has been taken for exhibits of imported and high-grade American cars, and the exhibits will be noticeable for special body designs. These shows always attract a large attendance, affording as they do an opportunity for the body designer and dealer to note the progress made in custom made bodies, upholstery, equipment, etc. A limited number of accessories will be displayed.

Motor Vehicle Makers and Allied Industries Vote to Support Government.

Factory Organization to Be Kept Intact and Take on War Work. —Some Decrease in Passenger Car Production Is Expected.

At a meeting in Detroit last week more than 150 automobile manufacturers voted unanimously to support the work of the Automobile Industries Committee at Washington, pledged to the War Industries Board and the War and Naval Departments their heartiest support and to a man expressed their readiness to turn over the vast productive facilities of the industry to the government as fast as the government can make use of them. In the meantime, automobile makers will keep their organizations intact so as to conserve the greatest possible potential strength for the present and future war programs of the government. President Charles Clifton, of the National Automobile Chamber of Commerce, presided, with every prominent company in the industry represented and also representatives of the Motor & Accessories Manufacturers' Association.

THE INFLUENCE OF THE AUTOMOBILE INDUSTRY.

Capital Invested.	
Makers of Passenger Cars and Trucks	$736,000,000
Bodies, Parts, Accessories	336,000,000
Distributors	41,000,000
Dealers, Repairmen and Garages	184,000,000
Total	$1,297,000,000
Annual Production to June 1.	
1,806,194 Passenger Cars	
112,200 Commercial Cars	$917,000,000
Wages Paid Employees.	
Passenger Cars and Trucks	$275,000,000
Bodies, Parts, Accessories	288,000,000
Distributors	25,200,000
Total	$588,200,000
Number Employed.	
Passenger Cars and Trucks	280,000
Bodies, Parts, Accessories	320,000
Dealers, Repairmen, Garages	230,000
Distributors	2,800
Total	832,800

No Cause for Alarm.

It was very clearly shown that the Washington authorities had no intention of arbitrarily cutting off the automobile business and that automobile men themselves have offered to reduce passenger car production according to the government needs for war materials or as the government may require the facilities of the automobile and accessory manufacturing companies. The heartiest response to the committee's efforts has been received from the War Industries Board and from the Army and Navy Departments.

Increase Not Expected.

Manufacturers appreciate that business cannot be entirely as usual during the war, as the principal business now is making war and not making automobiles, so that the industry cannot expect to increase production as in the past. The manufacturers attending the meeting were surprised at the great number of automobile men in the service and the spirit of co-operation which has been shown by the makers giving their best men to the government at great sacrifice to themselves and their plants.

It is realized that rather than give munition orders to companies which have to buy new machinery and build new plants, advantage should be taken of the productive capacity of the automobile and parts plants. An immense amount of war work is being done and preparations are being made to take over more work for the government.

A. W. Copland and Hugh Chalmers, of the Automobile Industries Board, who, with John R. Lee, were appointed to co-ordinate the government war requirements with the facilities of the automobile industry, explained the work going on at Washington. Their need for additional engineers was promptly answered by nine manufacturers volunteering the services of nine of their engineers to work with the committee at Washington for the period of the war.

Why Production Is Essential.

It was felt that selling transportation for millions of people and thousands of tons of freight as supplied by the modern motor car and truck, coupled with the War Railroad Board's request for greater motor transportation to relieve the railroads of short haul traffic, demands continued productive facilities in the industry, now rated as third among those of the United States.

By unanimous vote of the meeting the following telegram was sent to Daniel Willard, Chairman of the War Industries Board, at Washington:

"The automobile industry as represented by more than 150 manufacturers in session here to-day volunteers its hearty support to our Automobile Industries Committee in Washington and pledges to the War Industries Board and the War and Naval Departments their heartiest support and to a man expressed their willingness to turn their facilities over to the government as fast as the government can make use of them. In the meantime we hope to keep our organizations intact so as to conserve the greatest possible potential strength to the present and future war plans of the government."

Dealers Pledge Support.

Loyal support by 27,500 dealers was indicated by reports from different sections of the country expressing their willingness to help win the war by rearranging their organizations for the new situations created. The automobile men expect to make cars to as near a normal number as the materials and coal situation will permit, but it may be expected that there will be some decrease in the number of passenger cars produced, making them harder to get and higher in price.

Statistics of Industry.

The meeting was supplied with some interesting figures which proved the far-reaching influence of the automobile industry. They showed 230 makers of passenger automobiles and 372 makers of motor trucks in 32 states, with a capital investment of $736,000,000 and with 280,000 workers, to whom $275,000,000 in wages and salaries is paid annually. The production for the year ending June 30 was 1,806,194 motor vehicles, of which 112,200 were trucks, the total value of both being $917,470,938.

Digitized by Google

Depend on Production.

It was shown that 1,080 manufacturers of bodies, parts and accessories have a capital of $336,000,000, employ 320,000 workers and pay $288,000,000 annually in wages. Last year 18,000,000 tires were made, valued at $450,000,000. There are 27,800 automobile dealers and 25,500 garages, located in almost every town and village in the United States, all dependent on the production of motor cars. They have a capital investment of $184,000,000 and employ 230,000 people.

The Export Situation.

Exports for the year ended June 30 were 64,834 passenger cars and 15,977 trucks, the latter mostly for our allies in Europe. The value of these exports, including tires and parts, was $133,411,000. There are now 4,500,000 automobiles registered in the United States, of which 400,000 are trucks which

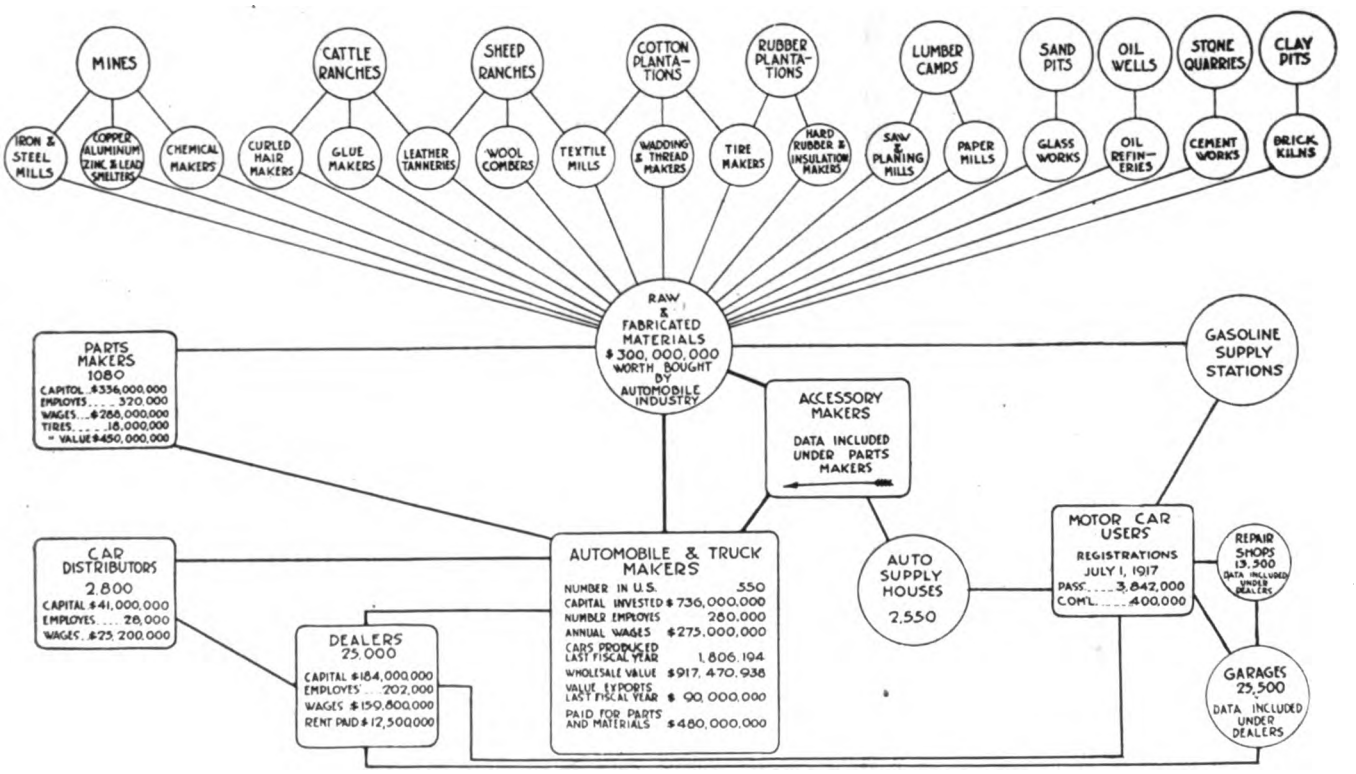

Chart Showing Sources of Supply and System of Distribution in Motor Car Industry, Capital Invested, Labor Employed, Wages Paid, Etc.

are annually transporting goods to a total of six billion ton-miles and relieving the railroads of short-haul traffic.

To Discuss Liberty Engine.

"The Reasons Behind the Liberty Engine" has been scheduled as one of the leading engineering subjects to be considered by the Society of Automotive Engineers at its winter meeting in New York Thursday, January 10. Major Jesse G. Vincent, who was largely responsible for the design of the engine, and who is now in charge of its development at the aviation headquarters in Dayton, O., will present a special address, going into the engineering reasons of the present Liberty engine. Instead of presenting a prepared address, which would have to be completed several weeks in advance, Major Vincent is going to deliver a comprehensive talk which will bring the question of aviation engineering up to the last minute. A special discussion will follow which will be opened by Colonel Clark, who is chief in charge of aviation engineering in the Signal Corps. His phase of the discussion will have to do with military requirements of aviation engines.

Form Commercial Body Corp.

For the purpose of centralizing under one head the distribution of commercial vehicle bodies for motor vehicles to chassis builders, through warehouses located in New York, Chicago and Detroit, the Commercial Motorbody Corp., with offices at New York, has been formed. Sales agents are to be established throughout the country.

At the warehouses bodies will be mounted, painted and lettered on the chasses. A most complete line of bodies will be carried in stock, ranging from the lightest to the heaviest types. This will, the company claims, eliminate the delay now experienced in securing a suitable body for a commercial chassis.

The directors of this corporation are: P. H. Patriarche, president; Charles M. Eaton, vice-president; Paul D. Langdon, F. Gates Porter, A. Harriman, T. W. Cole, J. K. Robinson, Jr., and Frederick A. Wagner.

Cause of Lost Compression.

A cause of lost compression and one generally overlooked is the registering of the slots of the piston rings on the piston. This trouble is not uncommon with some type of floating piston rings; that is, the rings are not anchored at one end in the groove of the piston. In replacing rings the slots should be equidistant.

Read What Car Owners Say:

Rev. H. Voisin, Red Deer, Albta, Canada.
So far your carburetor has given me good satisfaction; several times I have averaged 30 miles to the gallon. Sept. 17, 1917.

Methodist Episcopal Church, Gustave A. Frodie, Pastor, Blunt, South Dakota.
Some time ago I ordered a Ford size carburetor from you. After a good test I find it to be THE Carburetor. Sept. 8, 1917.

W. T. Thompson, Maricopa, Cal.
I have purchased one of your carburetors and I like it fine and would like to take the agency for them for the State of California or if not for the whole state would like for Kern County. Please send me your lowest price and all your particulars as soon as possible as I have three sales in view. August 30, 1917.

P. H. Grace, Los Angeles, Cal.
The carburetor received and I make 35 miles to the gallon of distillate. Sept. 12, 1917.

Chas. H. Wishmeier, Indianapolis, Ind.
Carburetor received and after attaching on Saturday last I drove the car 128½ miles, part of this trip through Brown County, the hilliest part of Indiana. Almost all the hills were very rough, making it impossible to attempt them on high, one especially being three miles over, took us a half hour to cross, all of which was run on low. I was following a friend of mine who also had a Ford standard carburetor and found that when we came to a hill where the roads were good I would have to lie back about a quarter of a mile behind him, as even with this distance between us I would almost always catch him before he got to the top, then have to follow him up the rest of the way on low. My wife used to be afraid of every little hill but after putting on the SUNDERMAN she said she is willing to go any place now. When we got home after this 128½ mile run I found that I had used just 5 gallons of gas, almost 26 miles per gallon. I certainly was well pleased as I made no effort to run the car to save gas. The best I have ever done before was 22 miles per gallon all on a level road. August 6, 1917.

Edw. G. McCarthey, Denver, Colo.
I received and installed your carburetor yesterday; after two hours test I found it to be just as you claimed. I would like your agency proposition as I have a large order for you.
Sept. 18, 1917.

John L. Bradley, 243 W. 50th St., N. Y. City.
Since having your carburetor attached to my car I have increased mileage very near double, that is from about 14 I was getting to close to 28 miles with it on. I have out of necessity had to put this car through the severest tests domonstrating our shock absorbers, and you can see from this that the saving in gasoline alone is really remarkable, and with this the increased power I have received makes it an *ideal* carburetor. Sept. 28, 1917.

Standard Poster Advertising Co., E. T. Broderick, Gen. Mgr., New Rochelle, N. Y.
I want to say right here if it wasn't the best I could find, price and all considered, that I would not have anything to do with it, and here in New Rochelle I have an Oakland 40 and three Fords using the carburetor and in Peekskill two Fords, and am anxious to get it on the Cadillac Oct. 10, 1917.

W. H. Fisher, Grand Rapids, Mich.
The writer has now used one of your carburetors a little over one year and am more than pleased with the results as I am getting very good mileage, and it gives me more power and speed. Made a trip down in Ohio a couple of weeks ago and averaged a little better than 27 miles to the gallon. Oct. 17, 1917.

R. F. Sturgeon, Empress, Alberta, Canada.
The carburetor you sent me is doing great work. Have got as high as 30 miles on a gallon with my 1913 Buick. I used to think I was doing fine if I got 15 miles out of the old one. I just put in new cylinders in the car as the old ones were scored, so there is no telling what I will get now, as I made the 30 with the scored cylinders. I made one trip 155 miles actual mileage (not speedometer) on 5 gallons (Imperial) of gasoline with three badly scored cylinders and a lot of oil working through above the pistons. Am perfectly satisfied with the carburetor. Sept. 20, 1917.

Elmer McKee, Richmond, Indiana.
I am using one of your carburetors with very good satisfaction on a Lexington car.
Oct. 25, 1917.

D. O. Johnson, Santa Rosa, Cal.
I received the carburetor and it works at all times to perfection, making the old Buick "40" run like a modern car. Oct. 7, 1917.

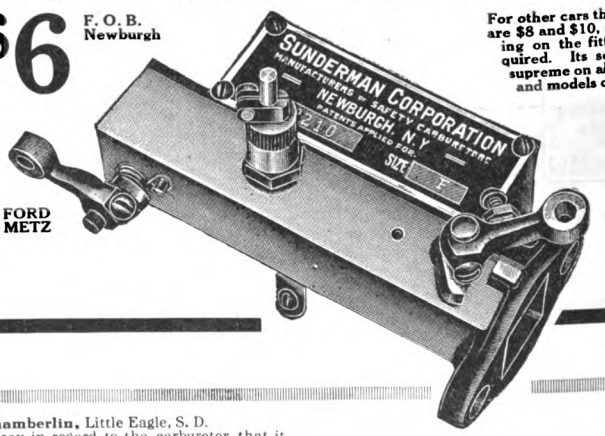
Our Satisfied, Enthusiastic Money-Making Dealers

Our advertising is an easy job. In every mail, every day, surprised and satisfied users, contented dealers who are making profits on Sunderman Carburetors, write us enthusiastic letters of endorsement. Printed just as they come to us, they make excellent advertising copy.

They Prove the Value of the Sunderman They Prove the Market and the Profits

The Sunderman Carburetor is without a peer in the the field of automobile accessories and parts—it is the only instrument that will make substantial profits for dealers, and at the same time make more money for the car owner who buys it.

The Saving in Gasoline Pays the Owner a Perpetual Profit



The Sunderman Carburetor is uniformly saving from 30 to 50% in gasoline on every car. Look at the letters on the left of this page, and let the owners prove this statement.

This saving alone sells the carburetor—the extra power, flexibility, pick-up and hill climbing ability come as good measure—an unexpected dividend on the investment.

SUNDERMAN

Vacuum Carburetor

$6 F. O. B. Newburgh

For other cars the prices are $8 and $10, depending on the fittings required. Its service is supreme on all makes and models of cars.

For FORD and METZ

O. W. Chamberlin, Little Eagle, S. D.
I will say in regard to the carburetor that it gives good satisfaction. 27 miles to the gallon is about the best we have done, but the roads are very bad and twenty miles is very good, in fact about 15 is the average for a Ford. My Ford is mechanically in bad shape, which I expect to remedy and then will give these people something to think about.
Oct. 7, 1917.

Chas. C. Kneeland, Groveland, Mass.
In regard to the carburetor I received from you a short time ago will say that I installed same on my Maxwell Roadster and fiud it is the best thing in the line of a carburetor that I have ever seen, in fact I am doing stunts with my car that seem impossible to the average car owner. I gave a demonstration to a friend of mine and on the strength of it I am ordering one for him. May 20, 1917.

F. H. Pierson, Poughkeepsie, N. Y.
I am sending you carburetor which I used on my Maxwell car with such good results that when I disposed of it I removed the carburetor, which I wish you would change and adjust so I could use it on my Ford. May 17, 1917.

H. W. Stebbins, Watertown, N. Y.
I am using one of your carburetors on a 22 H.P. Motor with so much satisfaction that I beg to inquire if you recommend that the same will work equally as well on a 8-10 H.P. 4 cyl. 2 cycle Motor.
June 15, 1917.

Bourne Brothers, House Painters and Interior Decorators, Milton, Mass.
I have had one of your carburetors put on my Ford truck and am much pleased with it.
July 16, 1917.

D. G. Douglass, Washington Mills, N. Y.
I bought a carburetor from you last year and it certainly did fine work. My Overland never ran better since I had it than since I have installed this carburetor. July 2, 1917.

F. E. Howard, Faribault, Minnesota.
Have a Sunderman Carburetor on a Reo car and it works O. K. Will run on kerosene when the motor is hot. July 12, 1917.

For FORD and METZ

John W. Shaffer, Kelly-Springfield Tires and Tubes, Delphi, Ind.

I recently purchased through the Universal Accessories Co. a Sunderman Carburetor and installed it in a 1913 Ford car. The results so far have been so surprising that I am writing in regard to territory. June 20, 1917.

A. M. Lockett & Co., New Orleans, La.

So far as economy is concerned, we do not think that your carburetor can be excelled, as the mileage obtained with the old carburetor was from ten to eleven miles per gallon of gasoline, whereas we are now getting from eighteen to nineteen miles per gallon. May 25, 1917.

G. D. Gates, Albion, R. D. No. 4, Pa.

Received the carburetor and the Sunderman is the best I have ever used. I have sold a number of your carburetors and they all give good satisfaction. June 9, 1917.

The New Adirondack Garage, T. J. Lynch, Prop.

Kindly ship me two more carburetors for small Saxon four-cylinder runabout cars. I have used four or five of them and can place at least 100 more. They are giving entire satisfaction and great mileage. May 24, 1917.

J. Berdquist, Fitchburg, Mass.

Have received and tested out Ford Carburetor you sent me recently. Find that it is working very good and I could without doubt sell a large quantity of them in this district. June 4, 1917.

Simmons Hardware Co., St. Louis, Mo.

Recently we wired you an order for a SUNDERMAN CARBURETOR to be used on a Ford car. This carburetor was for one of the employes of this firm and he states that it is giving excellent service. June, 12, 1917.

H. H. Palmer Garage, Bishop Hill, Ill.

I sent to Chicago and got two of your carburetors and put them on Ford cars and they worked fine. June 22, 1917.

P. H. Brown, Auto Repairing, Chepachet, N. Y.

I installed one of your carburetors on a Ford car and it worked so fine would like to sell them. July 27, 1917.

Dealers Who Handle Sunderman Carburetors Write as Follows:

Redden Motor Truck Co., Inc., 235 West 58th Street, New York.

Recently it was brought to my attention that the Sunderman Carburetor was a decided gasoline saver on the Ford car, and as my firm are always on the lookout for anything that will reduce the operating expense of a Ford car, I took it as a personal matter to try out one of your carburetors. The performance of the carburetor is certainly satisfactory in every respect. I notice that it is hardly ever necessary to use a throttle when on country trips, as the carburetor seems to be in itself an automatic throttle when coming on to grades or when pulling is hard in heavy going. As for gasoline economy, on my last trip I used a trifle over 6¼ gallons of gasoline on the run from Albany to New York. I certainly appreciate your arranging to have a service man at your factory on a holiday to attach a carburetor to my car.

Yours very truly,
L. S. HIGHAM, Sales Manager.
November 23, 1917.

Motor Car Equipment Co., Indianapolis, Indiana.

Received the carburetor and after installing it and getting the proper adjustment it certainly does work fine. Would like to try out one or two more before ordering in quantities. July 2, 1917.

The City Garage, Terlton, Okla.

Your carburetor arrived and we placed it on the Ford car and every one that has tried it thinks it works fine. July 11, 1917.

Russell & Wineland Auto Repair Co., Berwyn, Neb.

We received the SUNDERMAN VACUUM CARBURETOR a few days ago and have tried it out on my Maxwell and find it very satisfactory. We want to handle them here. May 14, 1917.

Thomas McClusky, Los Angeles, Cal.

I will write you again in regard to the SUNDERMAN CARBURETOR, as I have so many calls for them and I could install lots of them, as every one that rides with me in my car wants me to get them one and I tell them I will have some of them on hand shortly. If you can't do any better, send me literature and the prices so that I can satisfy those that I have promised. If you want me to have the agency, let me know and if so send me a half dozen at once, and by that time I can have you to send me fifty or more. And let me know the best price on them by large amounts. It would be impossible for you to get this little carburetor away from me if I could not get another one. Oct. 6, 1917.

Crown City Sheet Metal Works, Pasadena, Cal.

I am using one of your carburetors on a Ford machine which is giving almost double the mileage the one I took off did. I have never seen any carburetor to equal it. The machine runs smoother, with more power, and starts almost always on the first turn. Oct. 12, 1917.

Neikirk & Miller, Hardware Specials—Buggies, Implements and Autos, Greenspring, O.

We received carburetor for Ford car and have been using it since and have found it to be very satisfactory. June 14, 1917.

United States Automobile Supply Co., Omaha, Neb.

We have had very satisfactory results with the SUNDERMAN CARBURETOR and hope to greatly increase our sales in the near future. Oct. 24, 1917.

T. J. E. Pinson, Platte Center, Neb.

Once more I am impelled to write you about your carburetors. I now have 43 here working in good shape, they fire the engine all right, pull all right and have plenty of power. July 29, 1917.

Groveland Street Garage, Haverhill, Mass.

I ordered 6 carburetors yesterday, the 30th, and I wish to change that order and make it 12 in all, 10 Fords and 2 Maxwells. I wish to say that the carburetors are performing some wonderful stunts on the cars I have put them on. July 31, 1917.

N. J. Floan, Hibbing, Minn.

Received your carburetor last week, had it installed and it works fine. I can sell quite a few here and would like to get agency for same. May 23, 1917.

HOW TO FIGHT FIRES.

What to Do When Your Machine Catches Fire and How to Prevent Fires.

An authority on motor vehicle insurance states that the average automobilist rarely gives a thought to the ways and means of extinguishing a fire on his car should one occur. As fires are occurring with frequency the following suggestions are made and will prove of value in an emergency:

1. The most important thing to remember in case of a fire of this kind is to keep cool. A few seconds lost in panic at the start may result disastrously.
2. At least one small fire extinguisher should be on every car. It should be placed where it may be readily accessible in an emergency. The small extinguisher is indispensable in handling a gasoline fire, and is also useful in fighting any other kind of blaze about the car.
3. In the absence of an extinguisher sand or dirt can be used, but it should be remembered that if sand is thrown into the carburetor trouble is likely to result.
4. Do not use water in attempting to extinguish a carburetor fire or other gasoline fire. This merely tends to spread the fire.
5. If the engine backfires use the starter to turn the engine. If this does not draw the flames into the manifold use the extinguisher. This should put out the fire with little difficulty.
6. If the fire has reached the drip pan extinguish that first, and then work up to the carburetor.
7. If the fire is caused by ignition of gasoline from hot exhaust, short circuit or other condition about the car, the extinguisher should also be used with equally good effect.
8. Do not invite destruction of your car, and probable injury to yourself, by lighting a match to see how much gas there is in the tank.

Value of Corporation Schools.

To afford opportunity to those who wish to perfect themselves in retail and general selling in the trades, office work, etc., a number of leading industries of the country have formed the National Association of Corporation Schools, located at Irving Place at Fifteenth street, New York City. The object of the association, which includes a number of automobile manufacturers, is to bring into cohesive organization all of the large business institutions in order that, by analysis and comparison of methods adopted by the various members, the most effective plans may be devised for educating and training employees for their work. Practically every industry is represented.

Denver Dealers Prosperous.

The Denver dealers are enjoying a season of prosperity, having sold thus far 30,650 cars in Colorado, New Mexico and Wyoming, territory covered by Denver distributors. This is a gain of 50 per cent over last year. Industrial conditions are responsible for the big increase.

Battery Hints.

Keep the storage battery properly charged during cold weather. The chemical battery is affected by the cold and its output is not as great in winter as in warm weather. The points at which the electrolyte will freeze are as follows: Specific gravity 1.150, 13 degrees above zero; specific gravity 1.160, zero; specific gravity 1.225, 38 degrees below zero. If the battery becomes frozen, place it in a warm place until it thaws out. Have the cells recharged and replace the old electrolyte with new of 1.300 specific gravity. Batteries to be stored for the winter should be fully charged.

Ford Is Making Cars.

The report that the Ford plant has been entirely given over to the manufacture of munitions, etc., appears to be unfounded, judging from the number of cars stated to have been produced during the month of October. The total manufactured was 79,575 machines, bringing the total for the past six months up to 469,135 cars.

COMING EVENTS.

New York, N. Y., January 2-9.—Salon, Hotel Astor Ballroom, Automobile Salon, Inc.

New York, N. Y., January 3-4, 1918.—Quarterly Meeting, Automobile Electrical Association.

New York, N. Y., January 5-12.—National Automobile Show, National Automobile Chamber of Commerce and Motor & Accessory Manufacturers.

Same Smoothness after 12 months' service on Ford

Almost doubled hauling capacity of Ford and trailer

←Note thickness—showing little evidence of wearing down in 12 mo. service

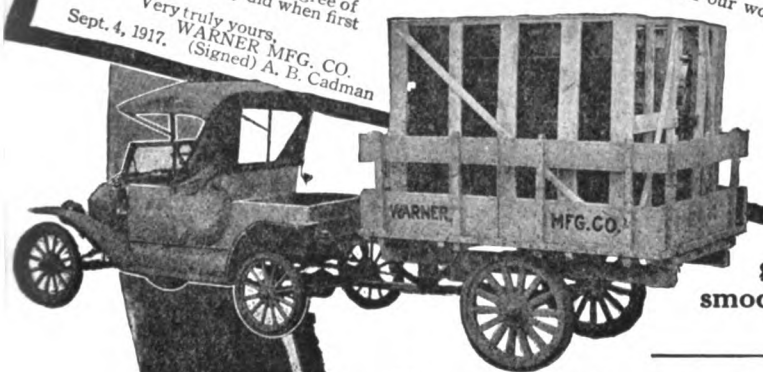
This Cork Insert equipped band was photographed after 12 months of the most severe service equal to 3 years wear on the average Ford car—read the letter of the Warner Mfg. Co.

WARNER MFG. COMPANY, Beloit, Wis.

Dear Sirs:

We have been operating our shop Ford equipped with your Cork Insert Transmission Linings for the past year. We have been using this Ford attached to one of our 2500-pound two-wheel trailers of which I am herewith enclosing a photograph.

Before equipping the Ford with your Cork Insert Transmission Linings we were using the usual linings that are furnished with the car and we were unable to haul more than 1500-pound loads successfully with the old style linings as we would frequently kill the engine in attempting to start the load in low gear. Also there was a decided chatter and racking noise in working the foot brake which led us to use Cork Insert Transmission Linings.



We have been operating this outfit very successfully hauling loads as high as 2500 lbs. and have experienced no difficulty in starting or stopping as they produce a smooth friction action without jar or chatter.

In other words, the use of Cork Inserts has enabled us to do all of our work with this Ford car and trailer which has practically eliminated the use of the one ton truck as it is doing all the work that we were previously doing with this one ton truck.

These linings are apparently working with the same degree of smoothness as they did when first installed.

Very truly yours,
WARNER MFG. CO.
Sept. 4, 1917. (Signed) A. B. Cadman

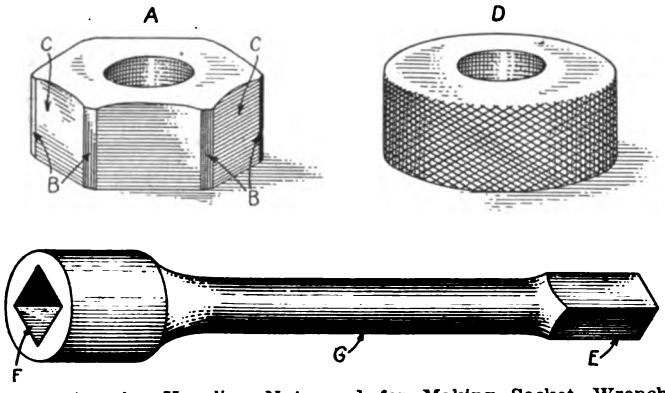
AMONG MISSOURI GARAGES.

Complaints of the Mechanic and Dealing With Nuts Hard to Reach With Ordinary Wrenches.



BY JAMES F. HOBART, M. E.

The mechanic was working hard to remove the nuts retaining the radiator bolts in place. He did not have a wrench which would reach the bolts in question and the work required a socket wrench having a shank at least 14 inches long.

"Not much room for a wrench there," remarked the writer to the mechanic. "No, there isn't," he replied, "and they are not improving engines either. Pretty soon you won't be able to find a cubic inch of space around an engine but what has something stuck into it. I tell you, Boss, it is a fright how they do crowd things up nowadays. Just look at these nuts, will you?"

The nuts certainly were in bad shape, so much so that the writer made a sketch, which is reproduced herewith. That shown at A had the corners B all worn off by constant use of wrenches which did not fit. The sides C were merely flat spots on the face of a collar, and the nut might as well be entirely round as flattened occasionally as shown.

As a suggestion, why not make such nuts entirely round as shown at D, so that almost any kind of a

Suggestion for Knurling Nuts and for Making Socket Wrench Extension.

pipe or alligator wrench would bite and enable one to tighten or remove the nut easily? I believe there are many nuts around an automobile which should always be made round and knurled, and we would know exactly what kind of a wrench was needed to handle these nuts.

The solid end ratchet wrench so much used by mechanics, carries a lot of very short socket wrenches. Added to these, there should be several socket shanks of varying lengths. The shank E of all these "extensions" should be the same size as the square hole in the socket ratchet wrench head or handle. The square hole F should be the same size as shank E, and two or more of these extensions may be joined together to form a rod of the required length, after which the proper wrench socket may be inserted at F, the wrench head applied and nuts in places difficult of access reached.

Then there is another use for such wrenches, that of putting on nuts on parts which are difficult to get at. Who has not, at one time or another, been put to a deal of trouble when trying to start nuts or bolts at the bottom of a deep or narrow space? When radiator bolts are to be replaced, that trouble will be met up with, and the extension socket wrench would permit of such nuts being started easily. It would only be necessary to daub the nut with thick grease. The nut would then stay in the socket wrench and not fall out when turned upside down.

The loose joints in the socket wrench extension could be made to hold together by placing a piece of paper in each joint and pressing them together. With the extension thus arranged, and the ratchet head removed, a nut could be started on a bolt and the nut screwed far toward home with the fingers upon the socket extension, the ratchet lever being applied only for tightening the nut after it had begun to turn harder than the fingers could manage.

An Enterprising Dealer.

F. W. Rohrs, of Rosedale, Md., conducts a garage and repair shop as well as deals in supplies, equipment, etc. After 20 years' experience as well as that gained by factory work, he believes in advertising his experience and his products. The following is one of the letters sent out by him and is interesting in that Mr. Rohrs is very frank in his statements as to his service, etc. Extracts from the letter follow:

To the public: I serve you with unadulterated gasoline at less than cost, measured without fear—and free air with good cheer.

If this service is of any value to you and you wish its continuation please remember that I sell everything that can be used on an automobile and repair everything that can be repaired on an automobile. I have spent approximately $11,000 in the past 18 years to gain the knowledge required to give the service I offer you. That I am one of the pioneers in the garage business, and that I have made distinctly separate studies of each of the following branches: Car repairing, ignition and carburetor adjusting, vulcanizing, welding, storage battery charging and repairing, etc.

I employ no mechanics except my immediate family, therefore all work is begun and finished by myself. Nor do I employ skinning methods to even up the loss of one job or sale, by extortion on the other.

I do not guarantee any work. I do same as near right as possible in the first place.

I do not strip old casings to use the weakened fabric for vulcanizing. Only new fabric, cut on the bias, and the best obtainable gum is used in my garages.

I do not use inferior welding rods for profit's sake.

I do not add acid to storage batteries to give the inference that they have been properly charged.

I do not conduct a price-cutting garage. I feel entitled to a profit on everything I sell, just as my customer desires a profit on his goods and labor. I give the public a square deal and expect the same from the public.

I do not recommend anything that I have not personally tried and tested.

I do no credit business. I buy for cash and sell for cash only. You pay for what you get and get what you pay for.

Respectfully, F. W. ROHRS.

Combination File and Gauge.

The vibrating type of ignition coil requires periodic attention as the platinum points become fused and pitted, setting up considerable resistance to the passage of the primary current. To clean the points it is customary to utilize a very fine file. These may be obtained at any supply house. As it is important to observe the proper space between the points of the spark plug, the following suggestion to combining a file and a gauge will be of value: The tang or end of the file is, as a rule, 1-32-inch thick. Grind the tang to the desired dimension, or proper gap, 1-64 or 1-32-inch.

To Tax the Army Truck.

The Commissioner of Internal Revenue has ruled that motor vehicles sold the government for service in the army are subject to the three per cent tax imposed by the war revenue act. This means that the huge fleet of war trucks will be taxed.

HEADLIGHT LAWS USELESS.

Representatives of Seven States Discuss Regulation With S. A. E. Committee.

That the laws governing the use of headlights are mainly quite useless was the decision arrived at by the legislative representatives of seven eastern states after a conference with the standards committee of the S. A. E. in New York City recently. The visitors were shown that the most effective regulation was that of the height of the light beam commonly called the 42-inch rule and that it is quite easy to apply this law by the use of very simple apparatus.

Another instance of where the laws came in for criticism was in an address made by Magistrate House of the Traffic Court of New York City, before the members of the Motor Truck Club of America. In speaking of the New York lighting law, he said:

"I don't know who prepared that bill, so far as lights are concerned, but it is a serious proposition. I don't believe that it is possible to comply in all respects with that law. One part of it says that the beams or the rays of your light shall not go a greater distance or be seen at a greater distance than 200 feet. And then, down in the next line, it says they must be of sufficient power to show an object 250 feet away.

"The man who drew this present bill, so far as the lights are concerned, had a 'nigger in the woodpile' somewhere. That is all there is to it. That law was drawn for some purpose. Whether it was drawn with the idea that somebody had or could get up something that might comply with the law, I don't know. But I don't believe that there is a genius in the United States today who can take the law of the State of New York, as it is regarding lights, and do anything that will make it possible for people to comply with that law."

Japan After Used Cars.

There appears to be an increasing demand for used cars in Japan. One New York dealer shipped over 100 passenger cars in 30 days recently, while others are shipping lots of 20. The demand appears to be for open cars and those in good mechanical condition. It is said that cars valued at $500 in this country fetch $2,500 in Japan.

Municipal Coal Gas Stations.

The use of coal gas as a fuel in engines is increasing in England. An innovation in connection with its use is the establishing in various sections of the city of municipal coal gas stations for general use of cars. These stations correspond to the curbside gasoline stations in vogue in this country.

Dealers Lose Cars.

Dealers in and around Indian country have a new peril in doing partial payment business. That is in the Federal statute providing for the forfeiture of vehicles used in transporting liquor into Indian country. In a recent case the statute was upheld by the United States District Court for the Eastern District of Oklahoma, an automobile having been seized, and the dealer who sold it having arisen to protest that he had a note for $400 secured by the machine. The court held, however, that the statute provided that the matter of ownership did not enter; the car had been illegally used, and was forfeited because of that.

Drain the Crankcase.

Too much emphasis cannot be laid upon the necessity of draining the old oil from the crankcase, flushing it with kerosene, and renewing the supply with fresh lubricant. Manufacturers of motor vehicles are conducting an educational campaign along this line and the owner will do well to follow the advice of the car maker. After oil has been in service for some time it loses its lubricating qualities. The result of using oil too long is trouble, and trouble means a repair bill.

How to Sell Automobiles

By C. P. Paxson

A valuable little book has recently been brought out, entitled, **"How to Sell Automobiles,"** but the information contained therein applies just as forcibly to the sale of anything else.

Those of our readers who are ambitious to become capable salesmen should order a copy of this book and study it carefully.

The price is $1.00, postage prepaid.

A check or money-order will be acceptable.

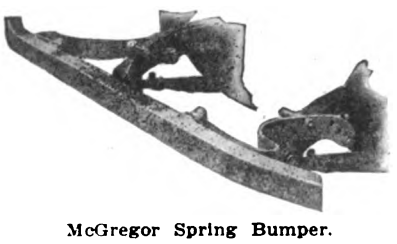
NEW AND INTERESTING THINGS IN MOTORDOM

Williams' Silverbeam Spotlight.

A unique feature of this lamp is its convenience when detached and used as a trouble lamp, it being light in weight and easily grasped and held in the hand by the focusing tube. The switch socket also is notable for an arrangement which



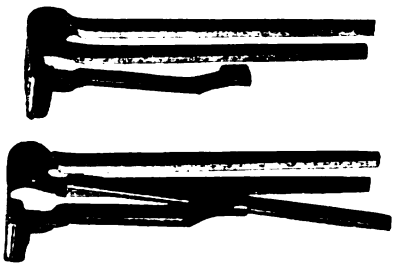
Silverbeam Spotlight.

renders it completely dust and waterproof. The light is especially handsome in appearance and is finished in heavy nickel with baked enamel in black or colors. The light illustrated has the Williams locking device, whereby the range of elevation ahead may be set at whatever limit the law specifies, making the light fully law complying.

The Silverbeam spotlight, it is said, will sell more rapidly than lower priced lamps when placed on the dealer's counter, because of the above named features. The value of these lamps has been shown by three years' of satisfactory test and service. Liberal discounts are allowed to dealers. Write for interesting literature, prices and full particulars to the Williams Mfg. Co., 308 N. Flower street, Santa Ana, Cal.

The New McGregor Combination Spring Bumper.

Illustrated herewith is a new bumper which has several meritorious features. This bumper combines rigidity with springiness, and this combination in a bumper is very desirable. It is made in different types of channel, diamond, round, tee and spring bars and high carbon steel is used in its construction. The bumper is fitted with universal adjustable brackets which fit any make of car, except the Ford, Chevrolet, Saxon, Jackson and Franklin. The new McGregor will also fit on the rear of all cars having extended frames. This



McGregor Spring Bumper.

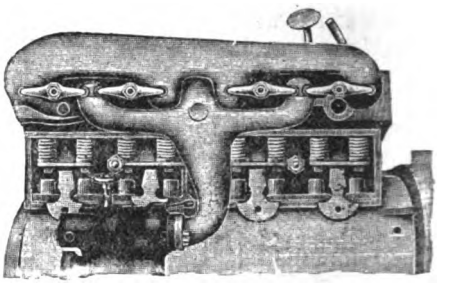
bumper does away with the necessity of the jobber stocking a number of special bumpers to fit Packards, Cadillacs, Dodges and other makes with mud fender aprons. This bumper is made by the U. S. Auto Bumper Co., 115-117 East 30th street, Chicago, Ill. The same company manufactures a large line of other bumpers, including special rear bumpers for the Buick, Cadillac, Overland and cars requiring special brackets. Readers who are interested should write for prices, discount and electros for 1918 catalogues.

Auto-Scope Windshield Wiper.

The White Lock Co., 1241 Michigan avenue, Chicago, Ill., is marketing a new windshield wiper, the Auto-Scope, which cleans both the front and the back of the windshield. Speaking of the Auto-Scope windshield wiper, R. B. Lacey, the general manager, states that a back wiper member is a most valuable addition to a windshield wiper. Every driver is familiar with the days when fog, moisture or condensation makes the back of the windshield in as much need of wiping as the front. Without some method for wiping this means ruining the gloves or soiling the hands. The rear wiper member of the Auto-Scope is made of absorbent felt. It is heavy enough to absorb the moisture which accumulates on the back during foggy, misty days but not heavy enough to cause dragging. This is held to be a decided advantage especially on rainy days when only the front of the windshield needs wiping.

The Auto-Scope windshield wiper works very easy. The front wiper mem-

Two Types of Auto-Scope Windshield Wiper.



ber is made of the best grade squeegee rubber. It will not become spongy, will not lose its efficiency and will not scratch the glass.

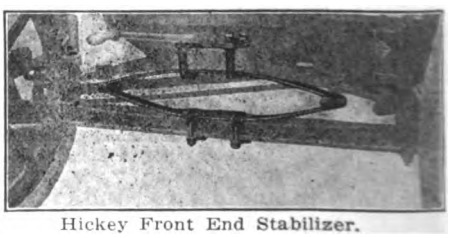
The Auto-Scope is practically universal in its application. It requires only a scant sixteenth of an inch at the top, works under a very close fitting visor and can be inverted and used through the opening between the upper and lower half of the windshield. No bolts, nuts or screws are used in attaching. It is quickly attached. Always exerts an even wiping pressure under all conditions. Absolutely cannot break the glass.

The Auto-Scope is made in three models: The Junior with no rear wiping member, furnished in black enamel, retailing for $1; the No. 1, cleaning both front and rear of windshield, furnished in oxidized finish, retailing for $1.50; the No. 2, cleaning both front and back of windshield, made of solid brass nickel plated and retailing for $2.50.

Warnola Power Valve Spring Compressor.

The Warnola power valve spring compressor is designed to solve valve grinding problems for owners, dealers and repair men of Ford cars. This specialty eliminates the necessity of removing the valve springs when grinding valves. The operation of the device is very simple and requires no mechanical knowledge. The price in sets of four is $2, or 50 cents for each compressor. This is a good seller for any dealer. Readers who are interested should

Warnola Power Valve Spring Compressor.



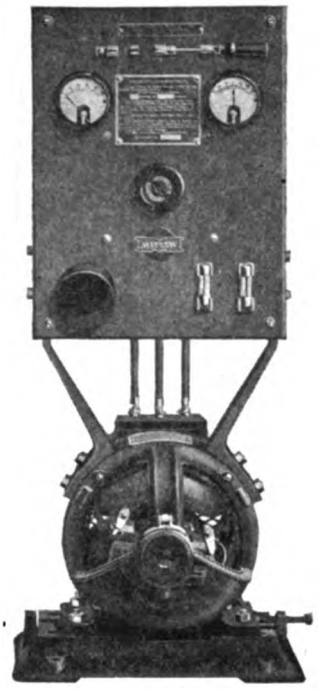
write to the manufacturers, Warnola Mfg. Co., 73 Wooster street, New York City.

Brunner Air Compressors.

A complete line of air compressors for garages is made by the Brunner Mfg. Co., Utica, N. Y. This company will have an attractive exhibit at the New York and Chicago shows. At the New York show, this company will occupy spaces D 151-152, D 179-180. At the Chicago show the Brunner compressors will be found in spaces 203, 204, 205, 206, 207 and 208 in the Coliseum. Jobbers will find competent sales representatives ready to explain the Brunner sales plan for 1918 at both shows.

A Ford Front End Stabilizer.

Illustrated herewith is a new device which has been brought out by Dan. S. Hickey, Jr., 40 Iffley Road, Boston, Mass. It is a Front End Stabilizer for the Ford Car. Everyone who has driven a Ford car realizes the value of such a device. This attachment is not only a stabilizer, but it also serves as a rebound check and easy steerer. It can be put on by anyone in 20 minutes. There are no holes to drill and no mechanic is needed. It can be put on Ford trucks as well as passenger cars. With this device installed you can drive your Ford car or truck at high speed and eliminate the danger of the car lurching from side to side when riding the ruts, rough spots and sand. The price of this



Hickey Front End Stabilizer.

extremely clever attachment is only $4, and the manufacturer makes a special offer to send this attachment to you, freight prepaid, on receipt of this remittance, but you must pay charges if the article is sent by express or C. O. D. Standard discounts allowed to jobbers and dealers. This is a quick selling specialty which ought to interest a great many dealers.

Digitized by Google

Country Garage Owners Should Investigate This.

Many owners of garages and repair shops reading this magazine are located where it is inconvenient or impossible to obtain current for electric lights and power. All such readers will be interested to know that a thoroughly practical electric lighting plant for comparatively small installations for farmers, small factories, garages or shops, is being marketed. Farmers and others who buy these plants know it is economy to buy the best and there are many country dealers and repairmen who could in the first place install one of these plants for their own use and convenience and then become successful agents among the farmers in their immediate neighborhood, as the equipment in the shops would afford them an opportunity of making a practical demonstration of the lighting plant for the benefit of possible purchasers.

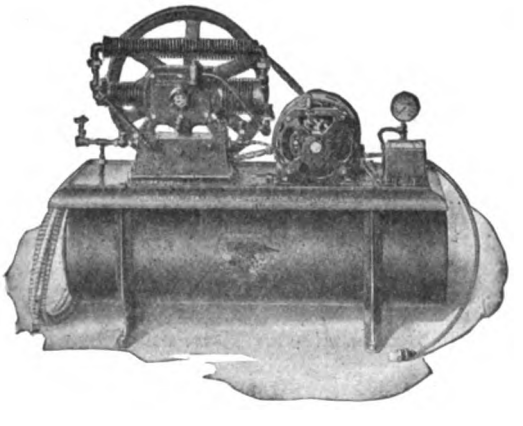
Mayhew Electric Lighting Plant.

The Mayhew-Electric shown in the illustration has been placed on the market by the Mayhew Co., Milwaukee, Wis., to meet this condition and the plant and the entire sales policy has been worked out to give the dealer the best possible proposition and to eliminate some of the petty annoyances that have been encountered previously in handling this business.

The plant is of the belted type and consists of a generator and switchboard made up in one unit and a storage battery which is shipped separately. The generator and switchboard are shipped in one box, the batteries are packed in two boxes so as to keep the weight of each box as low as possible and permit more careful handling while in transit. The special method used in packing the batteries has entirely eliminated the breakage of shipment.

The various elements of the plant are of well-known standard makes. The generator is made by the Peerless Electric Co., Akron, O., and the batteries by the Globe Electric Co., Milwaukee, Wis. Jewell instruments and a Cutler-Hammer rheostat are used on the switchboard, which also includes a Mayhew-Electric cut-out which is of an improved design and positively guaranteed. Glass fuses are furnished. These plants are made in three standard sizes provided with 60, 90, and 120 ampere-hour batteries, respectively. The generator has a capacity of 800 watts.

Ajax Trunk Equipment.



For long trips or even for moderate journeys, trunks and suit cases are absolutely necessary for the motorist. The Ajax Trunk and Sample Case Co., 144-150 West 18th street, New York City, between Sixth and Seventh avenues, manufacture a very complete line of trunks, sample cases, tire trunks, etc., for the auto trade. Dealers and car owners should write for complete catalogue to this company.

U. S. Two Stage Air Compressor.

An air compressor to afford that service to which it is intended, must not only be constructed of the best of material and have incorporated high grade workmanship, but operate quietly and be capable of providing an inexhaustible supply of air. It must avoid the possibility of oil, moisture or other foreign elements reaching the inner tube, and the correctly designed compressor must be proof against leakage.

The United States Air Compressor Co., Cleveland, O., is making a compressor which embodies the above named features and many others which will appeal to the owner of the garage and repair shop. The leading feature of the U. S. compressor is its two stage feature, so-called because the resistance of air under high pressure is taken care of by using a large diameter low pressure piston, and a small diameter high pressure piston, these so acting that a highly compressed charge is obtained in the tank, providing maximum efficiency at all times. This two stage feature also is held to save power and to reduce the cost of upkeep to the minimum.

One of the advantages emphasized of the two stage unit is that it will fill a tank in record time. The design comes with an automatic control which maintains the pressure in the tank and which can be adjusted to the desired pressure. There are 14 distinct features of merit which are described in the little booklet issued by the company which will be mailed free to those writing for same. The equipment of the de luxe H 34 U. S. compressor is most complete and the user has nothing to purchase to place the unit in service.

The U. S. De Luxe Two-Stage Air Compressor.

The E-Z Quick Tire Pump.

An entirely new tire pump for 1918 has just been placed on the market by the Mayo-Skinner Mfg. Co., 2115 Elston avenue, Chicago, Ill. The name of the pump is indicative of its merits. This pump is easy to operate because it is a small diameter pump, therefore the piston area is reduced, resulting in very much less effort being required to pump a high air pressure. It is also easy because the pump works perfectly free inside the barrel and has a large size air valve in the center through which the barrel is liberally supplied with air and to its full capacity. This valve is very simple in construction, having a flat leather washer which closes to an air tight seat on the pumping stroke and opens freely on the upstroke to admit a full charge of air. The pump is quick because it has a 22-inch barrel, thus enabling the operator to take long, full stroke, and every stroke carries with it a complete capacity of the barrel which has been supplied with a maximum charge of air, due to the large valve described. This pump is a quick seller for any dealer to handle and readers who are interested should write for prices, discounts and full particulars direct to the manufacturers.

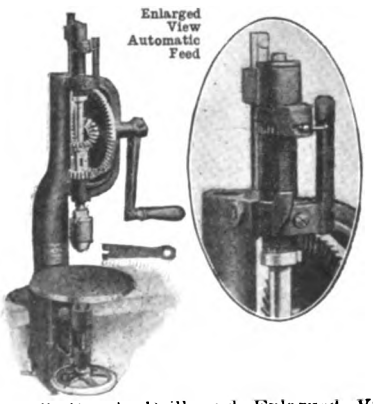
The E-Z Quick Tire Pump.

Digitized by Google

Fawsco Oil Cock Wrench and Cleaner.

Illustrated herewith is a useful tool needed by all owners of Ford cars, as it will not only accurately measure the gasoline in the tank, but provides the only sure means of learning whether oil is in the crank case or not. The pin will prove if the oil cock is stopped up or the oil used up. This new design is made of coppered Bessemer steel rod, nickel

Fawsco Oil Cock Wrench and Cleaner.



plated and black enameled, and is guaranteed to give complete satisfaction. These wrenches are packed in a heavy corrugated carton, 12 of them being contained in each carton. They not only are attractive to owners and dealers, but jobbers will find them easily sold, easily shipped and quickly reordered. Readers who are interested should write for prices and full particulars to the manufacturer, J. H. Faw, Inc., 41 Warren street, New York City.

Automatic Feed Bench Drill.

The labor shortage is bringing into garages and repair shops an unusually large number of mechanics of little skill; and in many instances this lack of ability is reflected to an astonishing degree in losses from tool damage and breakage, thereby adding to the overhead expense.

The practical check to such losses is, obviously, to install fool-proof machinery and tools, so far as possible. Drill breakage is a large item of expense in the average shop. And the evident thing to do is to use a drill tool possessed with some of the "thinking" capacity that many workmen lack.

The "Yankee" automatic friction and ratchet feed drill, a product of the factory of North Bros. Mfg. Co., Philadelphia, Pa., is equipped with a mechanism that automatically regulates the drill pressure according to the size of the drill point and the hardness of the metal that is being drilled. The friction feed operates automatically in moving the drill quickly to and from the work. The feed changes automatically from friction to ratchet the moment the drill be-

"Yankee" Bench Drill and Enlarged View of Automatic Friction and Ratchet Feed.

gins to cut into the work. Hand feeding is done away with entirely. There is no guesswork as to the pressure the drill will stand. Besides the operator has one hand free at all times for holding or manipulating the part he is drilling into.

A bracket at the top of the frame, with right and left arms, disengages the ratchet feed at the extreme up or down movement of the spindle and prevents jamming. The table can be raised or lowered with the sliding bracket, and also independently by means of the feed wheel. Or, it can be removed entirely, as for work which can be supported from the floor.

Altogether this "Yankee" bench drill, which is strong, rigid and gracefully constructed, has all the features a practical bench drill can have for speeding up work, insuring positive action and correct feed, and generally withstanding the varied uses and commonly rough handling that garage and repair shop owners have to contend with.

Frezalene.

Readers who are interested in obtaining a good preparation to prevent the

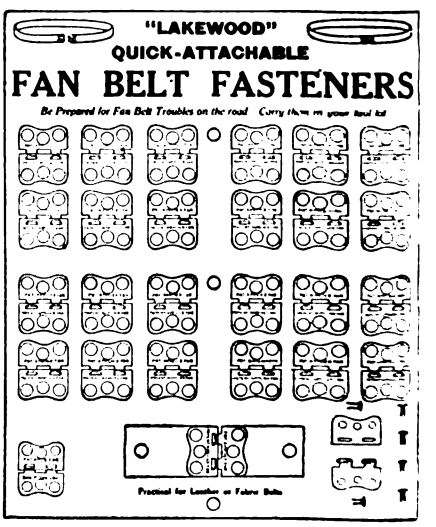
Frezalene.

water in the radiator from freezing are referred to the advertisement of the Frezalene Mfg. Co., 602-4 Bulletin building, Philadelphia, Pa. This company manufactures a compound called Frezalene which is an economical and safe anti-freezing radiator solution. It is not injurious to aluminum, will not gum the rubber connections, and it is absolutely harmless in every way. This is a quick seller for dealers who should get in touch immediately with this manufacturer.

An Ideal Hose Clamp Display.

Two different assortments of the most called for sizes of the well-known Ideal hose clamp are now offered to the trade by the Ideal Clamp Mfg. Co., Inc., 200-202 Bradford street, Brooklyn, N. Y. Six months ago, this concern placed on the market the Ideal hose clamp display box in an effort to supply the dealer with a practical assortment that he might display on his show case or in his window. This box was designed with great care and contained in display form 180 clamps, arranged in 18 compartments, according to size. The retail value of the clamps was $12.

This large assortment proved so successful and such a good business-getter that the manufacturers decided to put out a "pocket" edition of the display box to suit the needs of the smaller trade. This new assortment consists of 100 clamps of 10 different sizes, ranging from



Ideal Hose Clamps.

1¼ inch to 2⅝ inch outside diameter, neatly arranged in compartments as in the larger box. The total retail value is $8.00, and as the clamps are sold, they may be replaced conveniently.

The Ideal clamp itself needs no introduction to the trade. It is constructed as to act concentrically and forms a perfectly tight joint at all points and yet will not buckle or cut the hose, no matter how great the tension. By a special device of extra notches, one clamp is adaptable to several sizes of hose. It has proven a big seller.

A Clever Display Card.

Illustrated herewith is a display card which is provided by the Lakewood Fabric Belting & Mfg. Co., 1516 Highland avenue, Lakewood, O., for dealers in their well known fan belt fasteners. Readers who are not already familiar with these fasteners should get in touch with this manufacturer immediately. Car drivers appreciate these fasteners because they can be put on or taken off

Display Card for Dealers.

in a jiffy. They enable the dealer or repairman to quickly handle special fan belts to order. They are so durable that the manufacturer states they will outlast the belt. Dealers should find out about this line immediately.

The Shaler Roadlighter.

Long continued study and experiment by two expert illuminating engineers, during which the prime thought was the production of a smooth, broad illumination of the road without sacrificing intensity of distance light, has resulted in a new headlight lens with features that mark it with originality. Tests of the new lens convinced the C. A. Shaler Co., Waupun, Wis., for many years a leader in the vulcanizer field, that the perfected lens possesses merit that warrants it being marketed under the Shaler trade-mark and this company has secured the sole selling rights for the device, which will be known as the Shaler Roadlighter.

Shaler Lens.

Headlight laws in the various States conflict. The Shaler Roadlighter was designed with a view to eliminating objections and difficulties common to headlight lenses. It is not a dimmer, This lens is made of moulded optical glass, smooth on the front and having a series of prisms on the back, so arranged that all of the light is put down on the road and no rays reach a level greater than 42 inches above the ground at any point while the car is standing on the level. At the same time the light is spread over the roadway, giving a broad flood-light that illuminates from ditch to ditch. This light is of such intensity that one can see through the ordinarily blinding rays of an approaching light that glares.

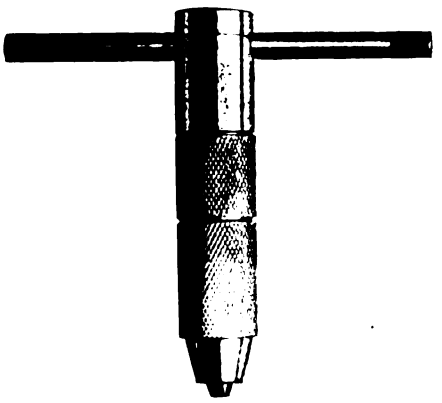
The construction of the lens may be briefly described thus: A little more than half of the lower part of the lens is a series of oblique prisms that meet in the center of the glass from right to left. In the upper part of the lens are two prisms, one smaller than the other, each beveled so that one gives a strong light for long distances and the other for intermediate distances, but none of the rays can reach a level greater than 42 inches above the ground. The oblique prisms take the rays from the lower half of the parabola and bend them downward and to the sides of the road, producing the effect of two spotlights, while the two upper lenses illuminate that part of the road directly in front.

As the result of exhaustive tests these features are claimed of the Roadlighter: 1—Illuminates the full width of the road as far as the driver would care to see, even in daylight. 2—The sides of the road and the ditches are brilliantly lighted—equivalent to using a spotlight on each side of the car. 3—The light on the road is of such intensity that the most glaring headlights approaching cannot take away a clear view of the ditches and road, even beyond the approaching car. 4—The rays illuminate the fog-shrouded road farther than one could see through the same fog in broad daylight. The reason for this is apparent. The small particles of water that make up fog reflect light back into the driver's eyes when the light from the lamps is thrown straight out. The Shaler Roadlighter bends the rays downward so that the reflection of light by the particles of water in the fog does not strike the driver's eyes. 5—Due to this bending down of the rays of light, it it not necessary to dim lights when approaching other cars as none of the rays can reach the level of the approaching driver's eyes.

In addition, the construction gives a smooth glass in front, eliminating the catching of dust, since the prisms are on the inside. Any type or style of lamp bulb can be used and it is stated that accurate focusing of the bulb is not necessary to produce a good light. The Shaler Roadlighter works equally well with acetylene lamps.

This lens successfully withstood tests made at Syracuse, N. Y., recently. The C. A. Shaler Co. have made exhaustive tests and others are scheduled for early dates. The lens has been widely approved by municipalities and an extensive selling campaign is under way. The lens comes in sizes for Fords at $2.75 per pair and for all other cars at $3.50. Marketing the Roadlighter does not mean that the Shaler vulcanizer production is to be curtailed; in fact, additions have been made to the Shaler factory that will make it possible to more than double the vulcanizer output in 1918.

Veteran Set of Cork Insert Transmission Linings.



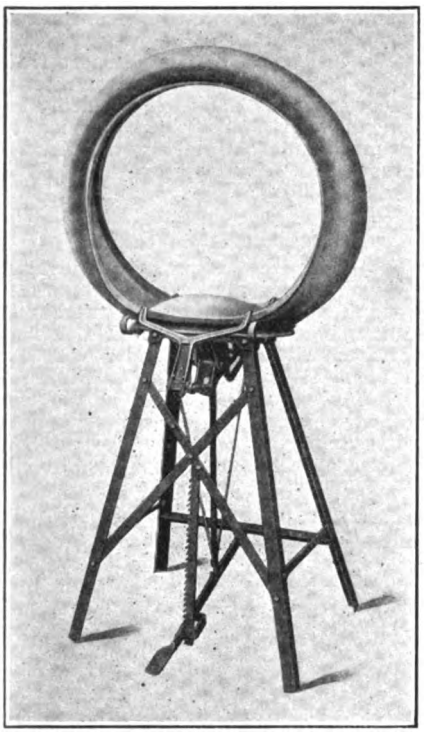
The Cork insert transmission lining on the brake band pictured above is one of a set that was used for more than a year's service on a Ford attached to a trailer. This particular Ford and trailer is in use every day hauling loads which run as high as 2,500 pounds. As the picture indicates, this lining is still in excellent condition and good for thousands of miles more of hard service. The long service secured from this set of linings is attributable to the buttons of cork inserted in high grade, long-wear fabric. Cork produces a wonderfully smooth friction action, and stops the slip which is very severe on fabric. Cork has also the advantage of wearing very slowly. As a result, Cork insert transmission lining is able to deliver a length of service which makes it decidedly economical. Cork insert transmission linings are manufactured by the Advance Automobile Accessories Corp., 56 E. Randolph street, Chicago, Ill.

Cork Insert Transmission Lining.

Ratchet Tap Wrench.

The Moss-Ochs Company, Cleveland, O., has recently placed on the market a new and very handy tool, a ratchet tap wrench, in two sizes. The No. 1 holds taps from 0 to ¼ inch and No. 2 ¼ to ½ inch. It is made with a sliding T-handle, permitting its use in the most difficult corners, which makes tapping and reaming a pleasure instead of a burden. The handle may be held center by means of a dog which automatically fits in a milled flat surface of the handle. Adjustment is made immediately to either right or left ratchet or rigid by turning a knurled sleeve. The chuck and ratchet is carefully hardened and all other parts are substantially made, insuring unusual durability.

Ratchet Tap Wrench.



Curtis Air Compressors at the Shows.

The Curtis Pneumatic Machinery Co., St. Louis, Mo., will be represented at both the New York and Chicago shows as usual with a complete working exhibit of Curtis garage air compressors. The exhibit this year will consist of the five different sizes of compressors, also the different sizes made up in different electrically driven combinations, such as a portable outfit, stationary wood base outfit and an iron base geared outfit with an automatic starting and stopping device. All of these compressors are of the "Curtis air—free from oil" type, which system of lubrication will be thoroughly demonstrated by the operation of a cut away model of the Curtis compressor. This will be an actual machine cut through the center of same, showing all parts in working position and under actual operation. Larger space has been taken this year, especially at the New York show, in order that the exhibit will not be crowded in any way, and that a more attractive setting can be had for same. This exhibit will be found in spaces D-171-172, 4th floor, Grand Central Palace, New York, and spaces 23-24, Armory balcony, Chicago.

Some Important New Garage Specialties

The Weaver Mfg. Co., Springfield, O., is bringing out several very useful and important garage specialties for the season of 1918, three of which are illustrated herewith. The Weaver tire spreader is designed for the quick and convenient inspection of tire casings. It affords an efficient means for inspecting the interior of casings, and this operation is always necessary in repairing a puncture, blow-out or other damage to either a tube or a casing. By means of a quick acting foot lever the casing is spread to its limit, thus exposing the interior for convenient and efficient inspection. The illustration tells its own story and will be readily understood by every tire repairman. Another equally important specialty is the Weaver auto hoist. This hoist occupies only a small area and its peculiar design permits it to be operated in very cramped quarters. It can be run into position over a car in a crowded shop without requiring more than 12 or 14 inches space on either side of the machine. The frame of this hoist is so designed as to permit the height of the arch to be increased approximately 12 inches, allowing the uprights to be raised to the desired height in the braces on either side by means of the worm hoist. This increased height enables the hoist to raise the rear end of a limousine or touring car with the top up, for removing the rear axle. One chain of the hoist may be carried over the pulley in the center of the frame for performing work which can be handled to better advantage by a single suspension. This hoist is perfectly safe, as it is strong enough to enable handling with ease and safety the heaviest passenger car. It will lift 3,000 pounds but is tested far in excess of that weight Still another live specialty is the Weaver auto oiler which combines the services of the ordinary funnel, oil can and oil measure and also eliminates the inconvenience, the waste and dirt which always accompanies the handling of oil in the ordinary manner. It is constructed of heavy galvanized iron and has a capacity of two gallons. The indicator is very accurate, being controlled by a compensating float which will record accurately in any position. The shipping weight of this oiler is 6½ pounds. In regard to prices and particulars on these and a large number of other live specialties for garage and repairmen, readers should write direct to the Weaver Mfg. Co., Springfield, Ill.

Weaver Tire Spreader.

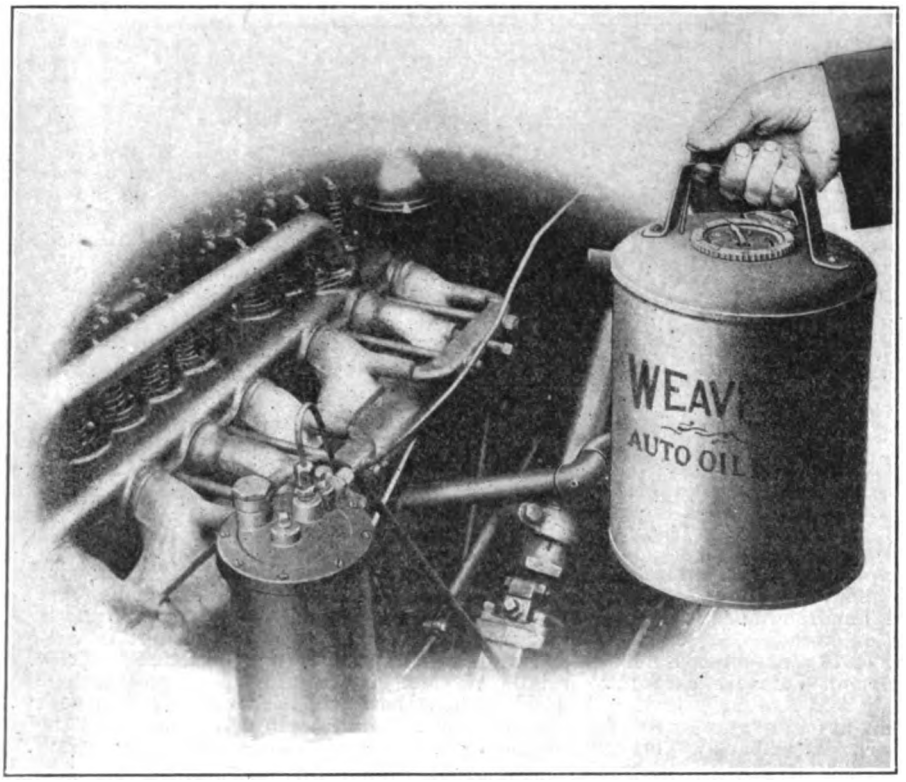
Weaver Hoist.

Repainting Your Car.

F. O. Pierce Co., 12 West Broadway, New York City, offers to owners of cars and to dealers a system of repainting which should be interesting to a great many of our readers. With this system anybody can paint a car in three days and completely obliterate the marks of the summer's usage with a hard, wearing, beautiful surface on all parts. The three coats are put up in convenient sets comprising the following articles: One can Auto Preservative undercoat for first coat, one can of Auto Preservative color coat for second coat, one can of Auto Preservative varnish for third coat, one sheet No. 0 sandpaper for sanding lightly after first coat is applied, one brush for first and second coats, one varnish brush for finishing coat, and two sheets No. 1 sandpaper for cleaning car. The paint and varnish comes ready for the brush and can be easily applied in black; or, if desired, the paint can be furnished in 12 colors. These paints cover old paint perfectly. Fifty years of experience is behind every can. A great many of our readers will be benefitted by writing to this company for what is called the "Simple System" booklet and price list.

The Silvex Company Reorganized.

The Silvex Co., of Bethlehem, Pa., manufacturers of Bethlehem spark plugs and other automobile accessories, have announced the formation of a new corporation under the laws of the State of Delaware, capitalized at $2,000,000, which will be divided equally in an issuance of $1,000,000 common and $1,000,000 preferred stock. The new board of directors includes: F. H. Schwab, president; J. H. Ward, E. B. Turn, W. M. Davidson and W. H. Lumpkin, all of Bethlehem. This company will shortly move into its new quarters, a modern concrete and steel factory that has been outfitted throughout with new machinery, deliveries for which were contracted for a year back.

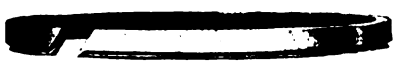


It is reported that the increase in capital and facilities has been necessitated by demand for this company's products, particularly spark plugs for use in the various types of aviation engines now being developed.

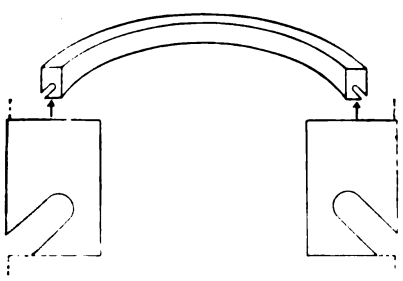
Tools for Garage and Repair Men.

A very useful line of tools for garage owners and repair men is manufactured by H. G. Paro, 1412-1414 Michigan boulevard, Chicago, Ill. This line in-

Digitized by Google



cludes Ekern's celebrated grease guns, also Ekern's Ford towing device, auto stands, motor stands, drive shaft tube supports, emergency axles and trailer hitches. Mr. Paro also controls the sale of the Fosnacht valve reseater, the Nasco valve grinder and the No-Leak-O piston rings. Jobbers and dealers should write for special prices as this line is well worth investigating.



Weaver Auto Oiler.

McQuay-Norris Superoyl Ring.

After three years of wide experimentation, the McQuay-Norris Mfg. Co., St. Louis, Mo., are putting on the market a special ring, designed and manufactured for the correction of oil trouble exclusively. It has been named the McQuay-Norris Superoyl Ring and is to be installed in the top groove of each piston solely as an oil ring; to keep excess oil out of the combustion chamber.

McQuay-Norris Superoyl Ring.

Showing Construction of Superoyl Ring.

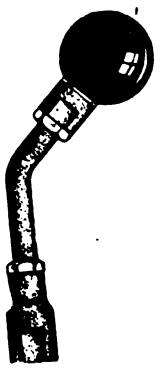
Probably no piston ring problem in the last several years has bothered engineers, dealers and garagemen alike as much as the increase in oil troubles. Fouled spark plugs, smoking exhausts and carbon deposits have increased markedly with modern engine construction. Much of this is due, it is said, to the high speed engine and the manner in which it operates most of the time. They run under only partially open throttles with resultant high vacuum, low explosion pressures and low compression, so that abnormal oil conditions are produced. It is to control oil troubles in such motors that McQuay-Norris Superoyl Rings are being manufactured and marketed.

While stating that this ring will hold compression as well as it is possible for any well made one-piece ring to do, its manufacturers state that it is a special ring for a special purpose—the control of excess oil—and recommend its installation in conjunction with McQuay-Norris Leak-Proof piston rings.

The Superoyl ring is a concentric ring, with an oil reservoir which collects all of the excess oil from the cylinder walls on each down stroke of the piston. Just the film necessary for lubrication is left. The position and shape of the oil reservoir is the exclusive McQuay-Norris Superoyl design. It is not a mere groove in the face of the ring.

This reservoir is cut into the ring with mathematical exactness at an angle of 45 degrees from the intersection of the cylinder wall bearing face of the ring and the ring's lower groove bearing face, as illustrated in the cross section cut accompanying this article. This makes a scraping edge of the lower end of the face of the ring which forces the excess oil in the reservoir along its upper surface.

The oil cannot, while it is being scraped into the reservoir, strike against the lower groove bearing of the ring, where it could creep into the groove and around the ring into the combustion chamber, because the lower edge of the reservoir terminates at a point slightly inside of the piston's outer surface. The oil is constantly kept building up against the upper wall of the reservoir until the down stroke is completed, when it is emptied again over the lower rings.



It is only by placing the oil reservoir exactly at the intersection of the ring's two bearing faces—the cylinder wall and the lower groove—that this action can be produced, it is asserted by the McQuay-Norris Company. A groove or recess in the ring at any other position, they declare, does not make it impossible for the excess oil, which is always under pressure on the piston's down stroke, to be forced under the ring and into the groove to work its way around the groove and then out into the combustion chamber. The ring is covered by patents and the trade-mark Superoyl is registered.

Economize on Gasoline.

England does not permit the use of gasoline, or petrol as it is called there, in passenger cars or commercial vehicles. The hauling is handled by steam trucks burning kerosene or by trucks using artificial gases of various kinds. For patriotic reasons the American truck owner should substitute kerosene for gasoline wherever he can. Thousands are now doing so by means of the Duntley hydro pneumatic generator which is an exclusive feature of Little Giant trucks. With this device Little Giant trucks and Convert-a-Cars (Ford one-ton unit) may be operated on a mixture of 50 per cent. gasoline and 50 per cent. kerosene or on kerosene or distillate alone at one-half usual fuel costs. The Little Giant is made by the Chicago Pneumatic Tool Co., Chicago, Ill.

Mellin's Gearshift Extension.

To obviate the necessity for leaning forward while shifting gears, The M. & H. Novelty Co., 857 E. 24th street, Los Angeles, Cal., is placing on the market Mellin's adjustable gearshift extension. It consists of an extension lever in three sections by means of which the operator can, with a single movement, shift gears easily, quickly and without moving the body. It is claimed that with this device the need for leaning over is obviated and the driver need not take his eyes from the road during the operation. The extension lever is reversible and can be attached in a very few minutes. The device is heavily nickeled and in no way detracts from the appearance of the car. The company also markets the Mellin tire lock.

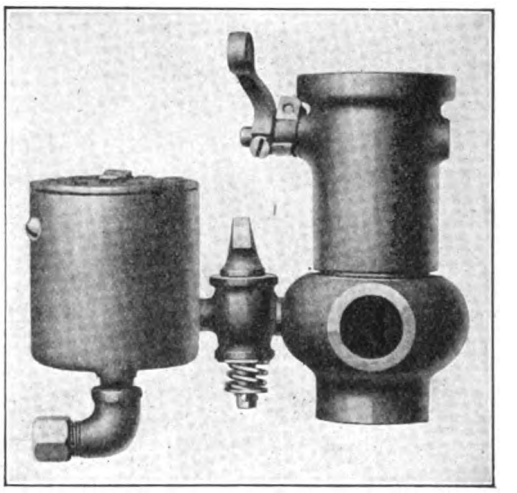
Cellbeam Concealed Spot Lamp.

Illustrated herewith is a new electric searchlight for automobiles, which has recently been brought out by the Cellbeam Mfg. Co., 1101 Bedford avenue, Brooklyn, N. Y. This compact light has an exceptionally powerful projector of

Illustrating Principle of Cellbeam Rays.

both spot and diffusive illumination. The concentrated beam of projected light extends 500 feet, while the objects close at hand are illuminated by a diffusived glow of indirect and transmitted light, devoid of the annoying direct filament glare. The principles used in the construction of this light are clearly shown in the diagram cut. The dimensions of the Cellbeam are such as to permit the concealment of the lamp in the side door pockets of an automobile. Wiring is as usual, to the battery cells, following the door hinges of the car. All lamps are hand patterned to steel dies and furnished in polished nickel with silvered reflectors. The lamp sells for only $8 at retail and a high grade switch is included in the handle, also an external focusing adjustment, five feet of flexible cord, a standard six-volt nitrogen bulb, while other special voltage to fit any electric current source can be supplied



Cellbeam Concealed Spotlight.

upon request. This is a quick selling specialty for dealers and all inquiries or orders should be addressed to the main office of the company in Brooklyn.

A Kerosene Carburetor for Fords.

Illustrated herewith is the Detroit kerosene carburetor especially made for Ford cars. The manufacturers make the following important claims for this new device. They state that it is possible to use kerosene as a motor fuel, if this carburetor is installed on any Ford car. They also state that this carburetor is non-adjustable, throttles down smoothly, idles without loading, increases mileage, is a positive fuel and money saver, eliminates condensation in cylinders and reduces speed changing. They estimate the reduction in cost of any Ford car owner using kerosene instead of gasoline to be about as follows:

One hundred miles cost on gasoline, $1.16; on kerosene, 40 cents; making a saving of 76 cents on each hundred miles. The Detroit kerosene carburetor retails for only $22 f. o. b. Detroit. It is sold with an absolute guarantee of 30 days' trial or money back. This carburetor will be exhibited at the New York and Chicago shows. In the meantime, readers who are interested should write for full particulars to the Detroit Kerosene Carburetor Co., Dept. 66, Kresge building, Detroit, Mich.

The Detroit Kerosene Carburetor.

Keeps Driver's Hands Warm.

Dealers in automobile accessory supplies are glad to welcome any article which helps them extend their selling season. One device that is now on the market that accomplishes this purpose is Steer Warms, an electric hand-warmer, put out by the Interstate Electric Co. of New Orleans, La. Because Steer Warms make driving comfortable in the coldest weather, many people will drive cars who ordinarily would put them up. This means more business for the accessory dealer. As an actual instance of the importance of this device to the accessory business, the case of the Madison Motor Co. will be cited. The Madison Motor Co., Madison, Wis., bought 13 pairs of Steer Warms. These were sold in four days and many more pairs were ordered. In the course of one month's time from the sale of Steer Warms their accessory business was increased 50 per cent. in an off month.

The automobile industry is vitally interested in the matter of keeping cars in use the entire year. Steer Warms is a device that helps do this. It is simple, inexpensive and practical. Steer Warms give comfort and pleasure no matter how cold the weather is and with them a motorist can drive his car all the time. Ladies particularly appreciate Steer Warms. Jobbers and dealers will find it to their advantage to push the sale of this hand-warmer.

Triplexd Hose for Motorists.

Dealer, garage owner and repair man knows the importance of using high quality gasoline hose and the Triplexd hose is recommended by all who have used it. For the appearance of this hose and a sectional construction, we refer readers to the very interesting full page announcement which appears for the first time in this issue of our magazine. The high service qualities are due to its three part construction, metal, rubber and loom woven fabric, the three parts being welded into a unit of strength and compactness through vulcanization. Triplexd hose is wonderfully durable. It can withstand weather, wear and hard usage, because it is strong, flexible and leakproof. The manufacturers state that 48 per cent. of the gasoline pump manufacturers of this company have adopted this hose as standard equipment and over 50 per cent. of the oil companies have adopted it. Readers who are interested should write for interesting literature and full particulars to the Metal Hose and Tubing Co., Raymond and Tillary streets, Brooklyn, N. Y.

Cylinder Grinding, Piston Rings and Gears.

Any of our readers in need of cylinder grinding, special over size piston rings or if they desire gears or sprockets of any description, should write to Nilson-Miller Co., 1302 Hudson street, Hoboken, N. J., as this firm is equipped to duplicate any machine part of any car, domestic or foreign, and the work is guaranteed as to quality, workmanship and material.

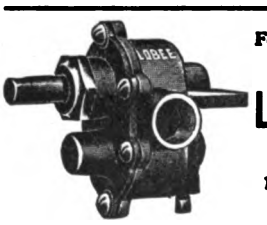
2497 Empire Bldg. Pittsburgh, Pa.

"LAKEWOOD" QUICK ATTACHABLE FAN BELT FASTENERS

(Actual size 1 inch Fastener. We supply necessary split rivets)



Take the "jinx" off Fan Belt Repair troubles.
On or off in a jiffy—makes Fan Belt Repair profitable to you and enables you to quickly handle "special" fan belts to order. Outlast belts.
Car Drivers will buy them separate also.
Write us direct or ask your Jobber to get them for you.
LAKEWOOD FABRIC BELTING & MFG. CO.
1516 Highland Ave. Lakewood, Ohio, U. S. A.

STOP THE SPRING BREAKAGE.

It's a poor policy to risk repeating the annoyance of a broken or weak spring—and the delay—by saving only a very little in buying or selling a *cheaper* spring instead of a "NEW ERA *BETTER* SPRING."
Don't replace a broken spring with one no better.
Wise dealers—sell only the best—
New Era "BETTER" Springs are the oldest and largest used line for replacement—at same price as from car factories. Made for all cars, GUARANTEED one year against breakage or sagging, graphited between leaves for two years' lubrication.
Write for complete line, discounts—or state requirements and class of business.
NEW ERA SPRING & SPECIALTY CO.,
1171 Hamilton St., Grand Rapids, Michigan.

Burke Condenser.

A device for preventing loss of fluid from the radiator of a car, whether the liquid be water, alcohol or other solutions used to prevent freezing, has been brought out by the Automobile Devices Co., 1621 Samson street, Philadelphia, Pa. The Burke condenser makes use of the principle of the worm used by moonshiners in distilling whisky. It consists of a shell for receiving the vapors, and it replaces the radiator cap as indicated by the accompanying illustration. A worm connects the top and bottom of the shell, and a double acting relief valve on the top of the shell governs the pressure in the radiator. Inasmuch as the overflow pipe of the radiator is closed, there is no loss of liquid, as any vapors given off are condensed, and the resultant liquid is used over and over again. Another advantage is that the proper level can be maintained in the radiator without loss. The device includes a relief valve which opens whenever steam is generated, and the steam can be easily noted. The Burke condenser is made in two models. The maker has a very interesting booklet describing the causes of loss of water, alcohol, etc., in the cooling system, and the brochure will be sent free upon request.

The Burke Condenser, a Device Converting Vapor Into a Liquid and Preventing Loss of the Fluid.

Front Wheel Roller Bearings.

Some car-owners report trouble with the standard cup and cone bearings furnished with Chevrolet 490 and Ford cars, in that the balls continue to break and eventually jam up in the cup and the broken parts grind up and destroy the cup. The balls also wear through the case-hardening of the cup and finally through the complete thickness of it. When such wear takes place it causes the wheels to become loose and throws them out of line, making steering unsafe and causing excessive tire wear.

All of these troubles have been overcome in the construction and operation of a Taper roller bearing which is being placed on the market by the Bearings Shop, 1402 Michigan avenue, Chicago, Ill. This bearing is made of the very best grade of steel and is scientifically ground and finished. It will replace the standard cup and cone bearing of the Ford and Chevrolet cars without any mechanical operation and will not require any changes to the hubs or spindles. Future delivery orders now in hand prove the worth of this bearing and present users have found it highly satisfactory.

Is Piston Ring Season.

Many owners put their cars in storage during the cold weather, and take advantage of this time to have the machine overhauled for the more regular use in the spring and summer. The conservation of gasoline and power can be greatly increased when these cars are being overhauled by the installation of a complete set of Gill piston rings. The Gill piston ring is manufactured by the Gill Mfg. Co., 351 West 59th street, Chicago, Ill. It is a piston ring noticeable for its simplicity and the perfection of its results. It is as easy to install as the old time split ring and has a distinctive joint which forms a seal that will absolutely prevent the escape of gas and the pumping of oil into the combustion chamber. The Gill piston ring will adjust itself to oversize or worn cylinders and will still be tight. The feature of this ring is that the joint itself is interlocking, keeping the ring tight at top, bottom and both sides.

Tires at Low Prices.

The Service Auto Equipment Corp., 951 Westover Bldg., Kansas City, Mo., offers high-grade tires at manufacturers' prices. Their stock, which includes no seconds, covers all sizes of tires, non-skid or plain and they offer to ship these tires prepaid on approval.

Increase Your Profits

A brilliant illuminating radiance on low engine speed for country driving when most needed and a variable dimmer for city streets to avoid arrest is the demand of the immense numbers of Ford owners, everywhere.

You can fatten your bank book by supplying this demand with ***Lite-A-Ford,*** an intensifier on low engine speed, variable dimmer giving seven degrees of light and an automatic current regulator. ***Lite-A-Ford*** retails for $2.50.

The remarkable performance of Lite-A-Ford combined with its low cost make it a rapid seller. Write today for terms and territory.

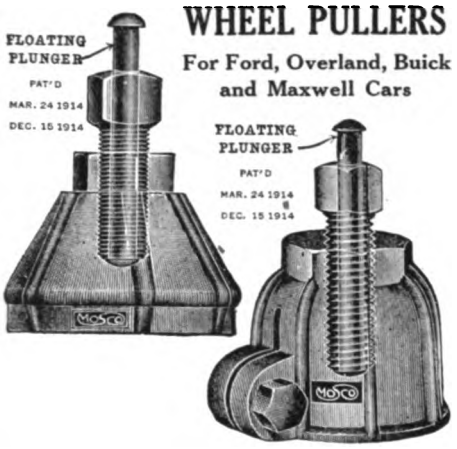
Hastings Mfg. Co., 209 Michigan Ave., Hastings, Michigan

Bittel-Leftwich Co. to Sell Dreadnaught Tires in Middle West.

Five years ago the Bittel-Leftwich Company started a tire service company in a small way at 3569 Lindell boulevard, St. Louis, Mo. In this time the company has grown to be one of the world's great organizations in its line, and now has a business and reputation which are nation-wide. As members of the National Association of Automobile Accessory Jobbers it carries one of the largest stocks of automobile accessories in the Middle West, of which the leader is the Dreadnaught tire. The company now occupies practically the entire ground floor of the Marina building at Grand and Lindell, with three branches in St. Louis and one at Webster Groves. Large branches are also being operated at Decatur and Springfield, Ill., and since taking on the Dreadnaught tire the company's business has increased to such an extent that a new building is being erected for it in Kansas City and a branch office will be opened at Little Rock, Ark. To sell Dreadnaughts and other accessories its traveling men cover Illinois, Missouri, Kansas, Oklahoma and Arkansas. The growth of the Dreadnaught tire business in the United States has been remarkable.

An executive of the company, when asked recently to point out the single factor that in his estimation contributed mostly to the upbuilding of this institution, said: "We think our policy of endeavoring to be not only fair, but over-fair with our customers, has had more to do with our success than any other single circumstance. There have been times when the pursuit of this policy has taxed our patience to a considerable degree, but we are now firmly convinced that it has given us a reputation that we could have attained in no other way."

New Manager for Mitchell.



Otis C. Friend, president of the Mitchell Motors Company, has resigned and has been succeeded by D. C. Durland. There has also been another change in the Mitchell organization, R. C. Rueschaw having resigned as a director and sales manager of the Reo Motor Car Company to become vice-president to the Mitchell Motors Company, and he will be associated with Mr. Durland in the general management of the Mitchell organization. Both of the new men in the Mitchell organization have long been favorably known in the trade.

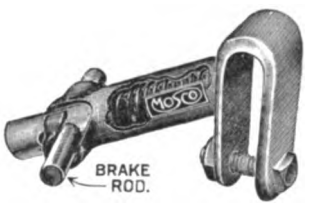
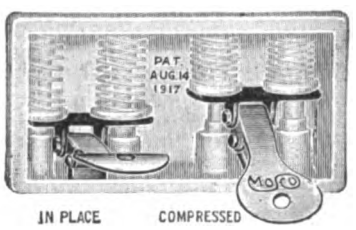
MOSCO SPECIALTIES MOSCO



WHEEL PULLERS

For Ford, Overland, Buick and Maxwell Cars

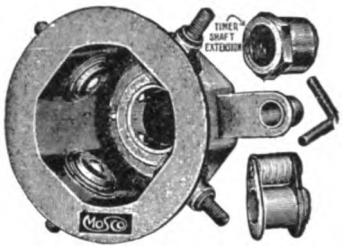
These pullers have an absolutely new feature in the loose plunger which extends through center of screw, affording a means of starting off a wheel which is stuck or frozen to the axle. A sharp blow with a hammer against the end of plunger is a wonderful help.



MOSCO Brake Rod Guides For Ford Car

Will positively silence the objectionable rattle of the Ford brake rod, without impeding its full movement. The grease cup prevents wear of the rods and permits easy action. Made of semi-steel and very easily applied.

Price, Plain, 40 Cents Per Pair
Price, with Grease Cup, 60 Cents Per Pair



MOSCO Valve Spring Compressor for Ford Car

The use of the MOSCO Valve Spring Compressor eliminates what is usually a troublesome operation, viz., the compressing and replacing of valve springs. By using this simple device, springs can remain in position until grinding of valves is completed. Made of heavy pressed steel.

Price, 50 Each

Improved Bemus Ball Contact Timer for Ford Car

Easier starting. Grease cannot prevent contact. Unbreakable heavy steel shell. Smoother running. Contact is positive. Longer life. No fibre ring to wear humpy.

STARTING—The chief cause of starting trouble in the Ford car is the presence of a body of hardened oil on the flat contact segments of the ordinary type timer, which prevents passage of current from the brush until continued turning has scraped off the grease. In the Bemus the use of balls for contacts eliminates this source of trouble, as but little oil is used, and the balls connot retain more than the slightest film on their surfaces.

Size (in carton), 3¼x3x2. Weight, 9 oz.

Price, $2.25

MOSCO No. 500 Fan Belt Guide for Ford Car

A safeguard against the familiar trouble of belt slipping on greasy fan pulleys. Made of semi-steel. Readily attached to side of timer gear housing without extra hole or bolt.

Price, 25 Each

MOSCO No. 200 Timer for Ford Car

Patented Oct. 31, 1916

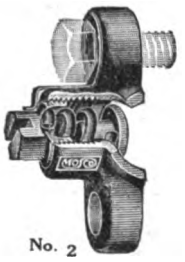
The case is made of extra heavy pressed stee., finished in aluminum. Gray bone fibre is used for raceway, with steel inserts dovetailed in and all lathe finished to a polished surface. The threaded terminals are insulated by fibre washers all the way through to contact points, thus removing cause of short circuiting common to this style of timer.

Price, Complete with Brush, Hex Terminals, Pin and Collar, $1.50 Each

MOSCO Anti-Rattling Ball Sockets for Radius Rod of Ford Car

For adjusting tension on ball socket on end of radius rod where it attaches in front of transmission case. Also eliminates rattle.

No. 1, Plain. Price, 30 Cents Each
No. 3, with Grease Cup. Price, 40c Each



MOSCO Valve Grinder

Patented March 7, 1916

This tool differs radically from others in several respects. It is really more of a machine than a hand tool, as it renders valve grinding an *accurate mechanical operation* rather than a guesswork hand job. **Price, $1.75**

MOSCO Anti-Rattling Ball Socket for Steering Rod of Ford Car

No. 2

AN ENTIRELY NEW DESIGN. For taking up the wear and eliminating the rattle on worn ball sockets on both ends of steering gear connecting rod.

Price, 20 Cents Each (2 in a carton)

MOSCO No. 209 Timer Brush for Regular Type Ford Timer

Patented Oct. 31, 1916

A brush assembly which will fit any Timer using this type. Die cast rotor of white metal alloy, laminated pressed steel arm, spot welded. Roller of phosphor bronze or hardened steel. NOTE the compression spring between roller and rotor, which does away with the breakage common to the expansion form of spring and also ensures even tension all the time.

Price, with Steel Roller, 40 Cents Each

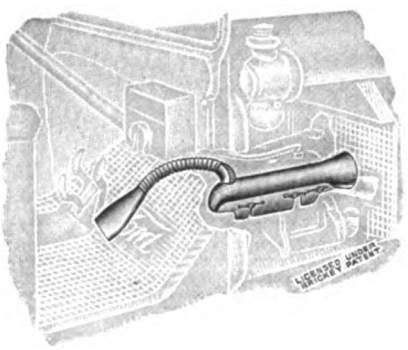
FORD OWNERS NEED NOT BE CRABS—LENGTHEN THEIR ARMS

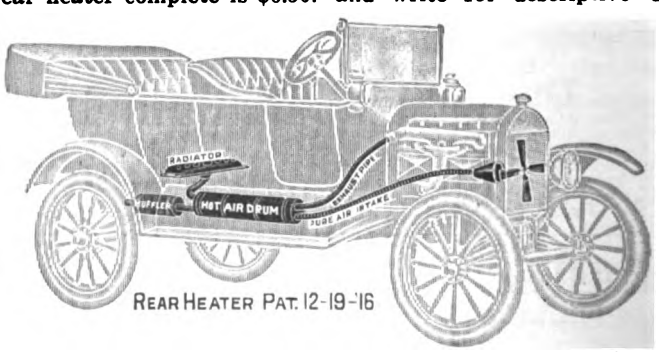
(Reproduction of Display Easel Furnished)

This tool is the most needed by all owners of Ford Cars, as it will not only accurately measure the Gasoline in the tank but provides the only means of learning whether there is oil in the crank case or not. The pin will prove if the oil cock is stopped up or the oil is used up. No other way is positive, and Oil and Gasoline MUST be there to run The Car.



If Your Dealer or Jobber Cannot Supply, Write Us

J. H. FAW, Inc., 43 WARREN STREET, NEW YORK



Pure Air Heating System for Ford Cars.

The vast army of Ford owners have long been looking for an efficient and inexpensive heating system. An ideal, simple and effective heater has been patented by a man who has driven a Ford car both winter and summer for the past seven years. Necessity is the mother of invention, and the inventor, R. S. Brickey, has assigned his exclusive manufacturing and sales rights to the Metal Specialties Mfg. Co., 338-352 N. Kedzie avenue, Chicago, Ill., who have perfected this device and are now manufacturing and marketing same in the form shown by the two illustrations herewith. The front heater for the driver's compartment consists of a heavy metal jacket made to fit closely over the manifold of a Ford car, securely fastened and held in place by the exhaust pipe clamps. The fan and the motion of the car drives the air through the heater over the hot manifold and delivers pure, heated air into the car through a flexible tube and fan-shaped radiator thus distributing the air over the front compartment of the car. The Presto front heater retails for $5 complete. The Presto rear heater consists of a cylinder about three feet long, which is placed around the hot exhaust pipe. A metal hose enters the front end of this cylinder which receives its fresh air from the small funnel shaped intake, held in place by one of the bolts on the front side of the engine. The pure air that comes through the radiator is forced by the fan through the funnel and cylinder over the hot exhaust pipe and delivered hot through a flexible metal hose and small register through the sliding damper into the car just in front of the rear seat.

The heat may be shut off either partly or entirely, as desired. The price of the Presto rear heater complete is $6.50.

Presto Heater for Heating Driver's Compartment of Ford Car.

Presto Rear Compartment Heater for Fords.

This system provides a real hot air heating plant that heats the entire car and avoids the possibility of any of the poisonous gases entering the car. The principle of the Presto heating system is exactly the same as a hot air furnace. It is very easily installed, as no new holes are drilled or tapped in the engine and all that is necessary is to cut an inch hole in the front and rear floor boards.

An Electrical Soldering Iron.

The Dover Mfg. Co., Dover, O., whose New York office is located at 30 Church street, is manufacturing an electric soldering iron which is highly thought of wherever it has been used. It can be attached to any electric lighting circuit and in a moment you have your iron hot enough to solder anything you want. There is no waiting for the iron to heat as in the old-fashioned way of doing things.

See announcement on another page and write for descriptive circular and price list. This company makes soldering irons of various sizes, one size being even small enough for the use of jewelers.

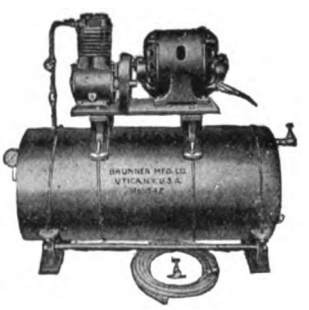
BRUNNER

The Brunner Garage Air Compressor

WILL BE EXHIBITED AT BOTH THE

NEW YORK AND CHICAGO AUTOMOBILE SHOWS

MAKE A NOTE OF THE SPACE NUMBERS



INVESTIGATE THE BRUNNER AIR COMPRESSOR

Every Motorist, Garageman and Jobber attending the New York and Chicago Automobile Shows will find it to his interest to visit the Brunner exhibit and should not fail to grasp the opportunity to become better acquainted with the use of compressed air for tire service.

The motorist interested in the proper care of his tires will find our engineers anxious to give him advice regarding the proper use of compressed air for tire service. The Garageman, whether he is a user of Brunner Equipment or not, will find our engineers ready and willing to assist him in solving his compressed air problems.

The Jobber will find our Sales representatives ready to explain the Brunner Sales Plan for 1918. We extend you a cordial invitation.

P-U-L-L
OWERFUL
ERSISTENT

GREATEST improvement ever scored in puller construction. Gives direct —mighty pull that jerks off wheels, bearings, gears, or pulleys—**quick** —**easy**. Does away with need of special pullers—sweeps aside all their multitude of bothers. Pushes work through in jig time. Lessens labor. Increases garage earnings.

"LITTLE GIANT"
Gear and Wheel Puller

is amazingly simple. Instantly adjustable up to 13 in. Practically indestructible—drop forging and hardened steel throughout. Gives maximum pulling power at minimum effort. Never twists or slips. The principle is right—

"The Harder the Pull—the Tighter the Grip"

In tight places—on delicate jobs—for heavy work —**anything** that demands pulling—it's there. A necessity in the garage, machine and repair shop.

READY TO HANDLE WINTER BUSINESS?

Do you want to avoid loss of time and trade and the expense of making repairs to those old-fashioned gasoline pumps?

You know how frigid temperatures affect the mechanism of the "blind" type, slow-up service and hurt sales.

GUARANTEE VISIBLE PUMPS

No confusion of ratchets, springs and cogs. Simply press a button—the sturdy motor instantly creates a vacuum in the big, clear glass measure.

In one minute your customer has his gas and is on his way. He's satisfied, for he has been served quickly **and he saw what he paid for.**

HALLADAY BUMPERS

The New Multiple Spring Bar

The latest and greatest improvement in bumper construction.

An absolutely new bar construction, comprising a heavy spring steel front bar joined to two supporting bars by means of flexible connections that eliminate breakage.

The final shock-absorbing qualities are attained through heavy buffer springs between the main and support bars.

The result is a bumper with no weak spots, but with the greatest resilience and shock-absorbing qualities ever attained in bumper construction.

We furnish this bar with the fittings shown in the illustration or with any of the Halladay fittings.

HERE IS A WINNER FOR LIVE DEALERS

The experienced car owner instantly recognizes its mechanical qualities and efficiency, and everyone appreciates its thorobred lines and beautiful finish.

Our new catalogue is now ready, every dealer should have one.

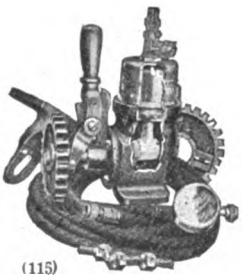
ENGINE-DRIVEN TIRE PUMP

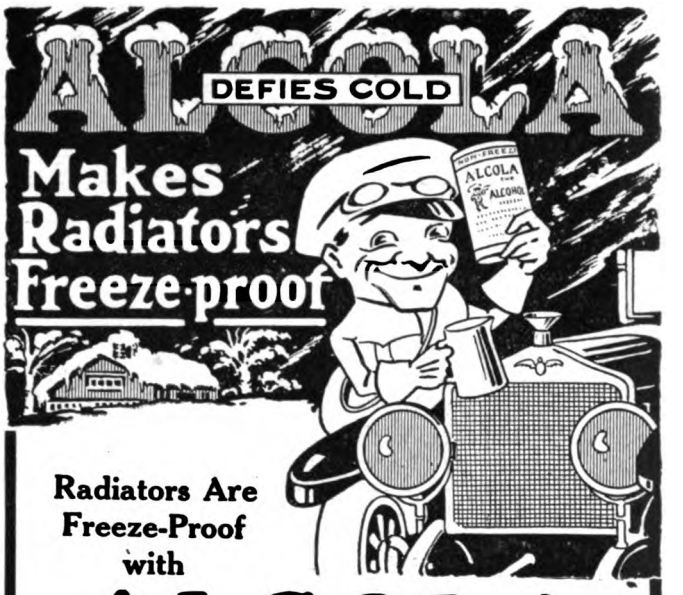
Does what *no* other tire pump *can do.* Because BUILT as *no* other pump *can* be built.

Piston works *through* a Packing-Ring, reducing wear to the *minimum.*



Beveled base of Ring shaves surplus oil off piston at every stroke. Permits ample lubrication, but prevents oil passing Ring.

Ring is endless. No gaps for air to leak out or oil to leak in. Can be instantly adjusted (by turning cylinder) to maintain air-tight, oil-proof fit, and insures 97% efficiency. This high efficiency enables the CRANE to do the work of pumps twice it size, weight and parts.



And small size, light weight, few parts and simplicity means low production-cost.

That's why the CRANE sells for $10 complete despite high grade materials and finest workmanship.

The full story of the CRANE and its patented Packing-Ring is told in an interesting little Folder—just off the press. Write for FREE copy to-day.

DEPENDABLE FREE AIR WITHOUT OIL

New York Show Exhibit
Spaces D-171-172

Chicago Show Exhibit
Armory Balcony Spaces 23-24

Better Service Brings You More Trade

Auto owners have awakened to the fact that all "Free Air" service is not alike. They are demanding PURE AIR for their tires because they have learned that oil rots tires and that AIR FREE FROM OIL means less blowouts, fewer punctures, greater tire mileage, less repairs and a great saving in up-keep every month. Cater to the demands of the auto owners—give them what they want. Make your place the most popular in town by furnishing

CURTIS AIR
FREE FROM OIL

Curtis Compressors are the result of 25 years experience in the manufacture of high grade pneumatic machinery. They are reliable, dependable, require practically no attention, are economical to operate, guaranteed to stand up under the severest strains of hard usage and furnish a continuous supply of cool, pure, clean air. While otners claim to furnish air free from oil, Curtis is the only Garage Air Compressor with the controlled splash oil system—**our own exclusive patented device** which prevents flooding the cylinder with more oil than it needs or can use—and eliminates all danger of forcing oil into the air line. Curtis Air is pure air—free from impurities—free from oil—the kind of air that makes tires last longer and pleases every patron.

Curtis Compressors Pay For Themselves

They build business—hold your old trade—bring new patrons to your door—and by the superiority of your Free Air Service, create a feeling of confidence in the quality and reliability of your entire stock. And more than that—a Curtis Compressor will save you big money by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools and serving you in many other ways.

5 Sizes—125 Combinations

There is a Curtis Compressor to meet the requirements of your business in every way—just the size, arrangement and price to please you. It will pay you to investigate. Ask your jobber—or cut out and mail us the attached coupon TODAY.

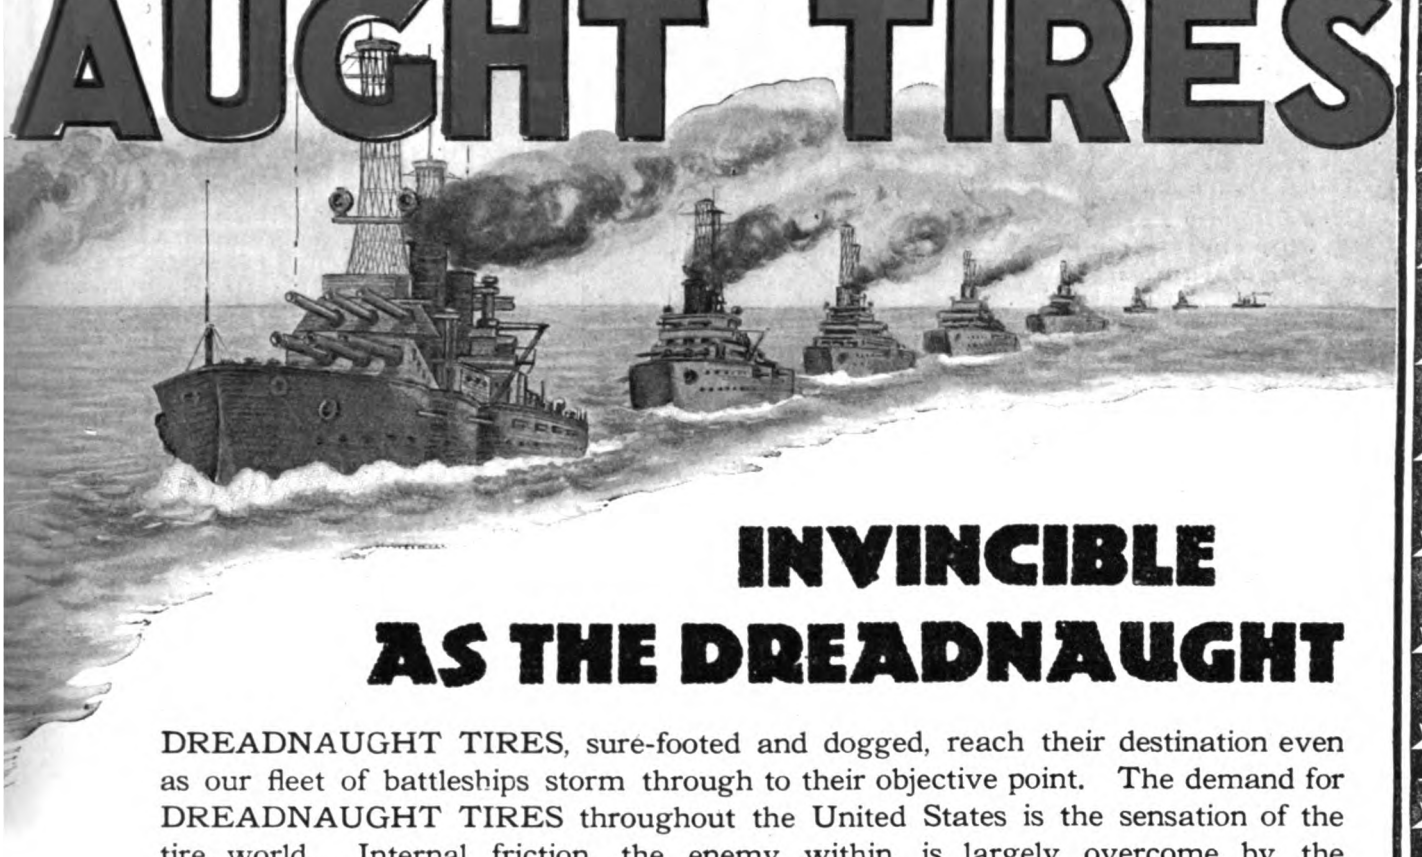
DREADN



DREADNAUGHT
REINFORCED
VACUUM
TREAD

THE greatest invention for power, attack and invulnerability, is the battleship—the Dreadnaught type, a name typifying strength, power and resistance. What single word could more perfectly tell the whole story of the makers' confidence in the product than DREADNAUGHT. So DREADNAUGHT TIRES have come to be known in the world of automobilists as THE tire with the power, toughness and strength to resist and repel the tire enemies of the road.

Digitized by Google

AUGHT TIRES

INVINCIBLE AS THE DREADNAUGHT

DREADNAUGHT TIRES, sure-footed and dogged, reach their destination even as our fleet of battleships storm through to their objective point. The demand for DREADNAUGHT TIRES throughout the United States is the sensation of the tire world. Internal friction, the enemy within, is largely overcome by the DREADNAUGHT process of frictioning the fabric and by the use of a very heavy skim coat between the plies.

5,000 MILES GUARANTEED

DREADNAUGHT TIRES are made in two treads—the DREADNAUGHT reinforced Vacuum which has solved the skid problem and the DREADNAUGHT Ribbed Tread which supplants the old-time plain tread and is universally the front wheel favorite.

SUPER-DREADNAUGHT RED INNER TUBES retain their elasticity and velvety softness to the last mile. They are generously thick. When used in conjunction with the DREADNAUGHT casing they make the perfect tire.

MANUFACTURED BY

The Dreadnaught Tire and Rubber Company

BALTIMORE, MARYLAND

We have an exceptional proposition for dealers and assure excellent service and territorial protection with intensive co-operation from our organization. Write or wire, Department "I."

MASTER

THE PROPER PLUG FOR

Passenger Cars
Motor Trucks
Tractors
Marine Engines
Stationary Engines
Airplanes
Fire Apparatus

ONE OF THE BIG ESSENTIALS

— toward speeding up the transportation of the country is— Uninterrupted operation of all motor vehicles.

MASTER

Calorite Spark Plugs

— in every detail of the materials entering into the construction,
— in the high quality of workmanship,
— in the individual test of each plug under actual conditions of pressure and electrical voltage it may encounter in actual service and—in their scientific design Master Plugs answer every requirement indicated for a spark plug of exceptional stamina, long life and freedom from troubles characteristic of plugs not so well known nor of the quality of Masters.

A combination of—self evident value, liberal margin for both jobber and dealer and a guarantee broad in its scope, makes the distribution of Master Calorite Spark Plugs an attractive and extremely desirable concession.

We shall exhibit at the New York Show—Grand Central Palace—Space D 57.

There are many good reasons why Master Calorite Spark Plugs should be your selection.

Their design is in accord with the best automobile engineering demand and practices.

They are sturdily constructed of the finest materials obtainable.

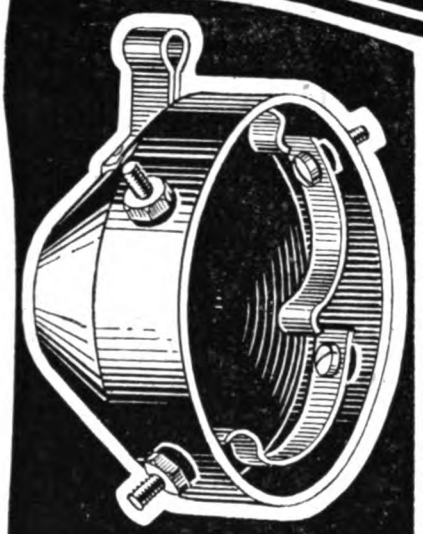
They are tested under rigid inspection rules.

They are generously guaranteed.

And in their resale you derive a margin of profit which justifies your whole hearted recommendation of these plugs to your customers.

There is a Master Calorite Spark Plug for every variety of service.

And the retail price is amply justified by their efficiency and durability.



$1.00 and $1.25 retail
Depending upon the size.

TRADE APCO MARK

TIMER FOR FORDS

$1.00 LIST

I AM a brand new idea in Timers for Ford cars and I will give your Ford such ignition as it could not get, except with a high tension magneto.

I WILL serve you longer and with less trouble than any other Timer, at any price, because I am not an ordinary Timer, made cheap, but an extraordinary Timer built well and sold at a low price.

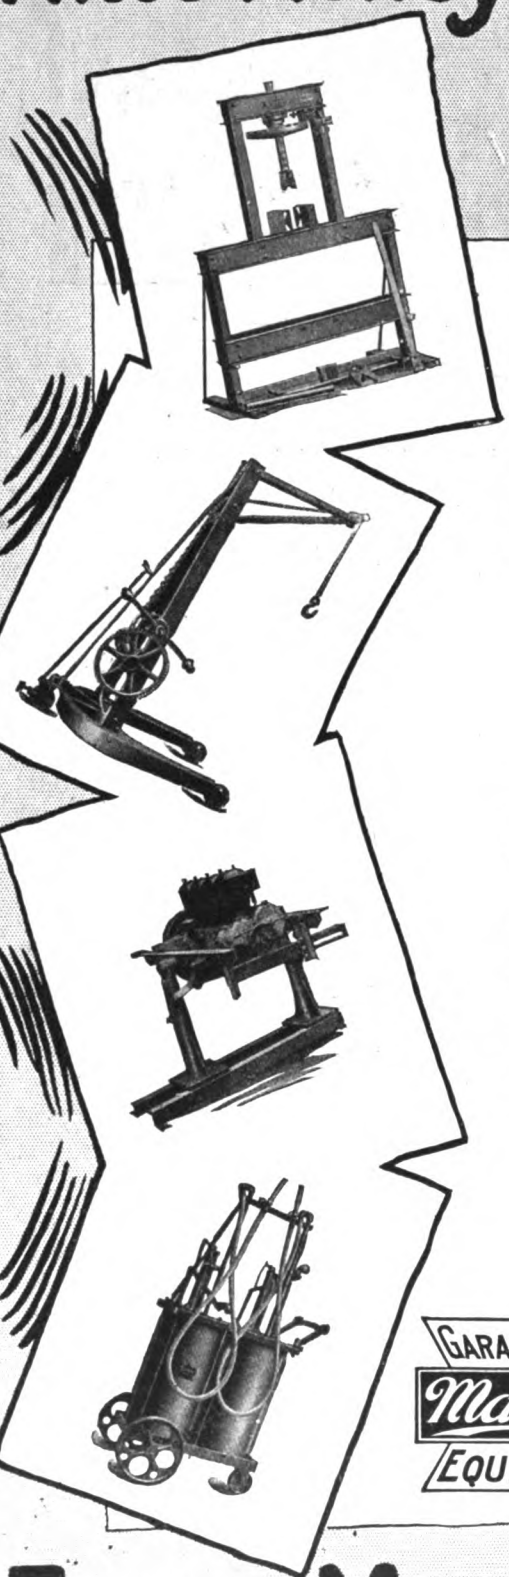
I AM not dressed up in gold plate, enamel or even aluminum paint; but man, how I can work!

I COME of good stock; my springs are clock springs; my roller is high grade hardened steel, running on a hardened steel bushing held in a die casting; my insulation is the finest quality bone fibre.

I WILL give you more power, more speed, a quicker getaway, an easier start, smoother running, no short circuits, longer life to your platinum points, more miles to the gallon of gasoline; and take it from me, when I go to work for you, you can forget your Timer troubles.

I HAVE no fibre ring to swell and give trouble and I have no delicate spring to hold the roller against the contacts. Instead of this, my contacts are heavy springs and my roller is on solid arms attached to the cam shaft.

I CAN work hard, and if I wear out my springs, they only cost twenty cents a set and you can replace them in a few minutes on the road. If your car lasts long enough to wear out a roller, a new one cost thirty cents complete, and as for my body, it never wears out.



I COME in a heavy cardboard box and the Apco on the outside is all the reference you need.

I WILL work for you as long as I live and the "good die young" phrase does not apply to me.

These Money Makers For Prizes at the Auto Shows

EVERY garage man visiting our exhibit at either the New York or Chicago Show will be given an opportunity to get some of the famous Manley Garage Machines **free.**

We will conduct a contest at both Shows and will give away four of our most popular machines as prizes to the winners. These prizes will be:

One Manley 22-ton Press
One Manley 1-ton Portable Crane
One Manley 2-tank Oil Service
One Manley Engine Stand

The contest at either Show will be distinct from the contest held at the other. Every visitor can have a chance on all four machines given away at the Show which he attends.

Manley equipment is designed and built especially for garage service and conditions. These specialties have been proven great time and labor savers for garage work in all parts of the country. You should be interested in seeing this line and learning how it will enable you to make money in your business.

OUR EXHIBIT WILL BE LOCATED AS FOLLOWS:

Chicago Show, Space 10D Coliseum Basement.
New York Show, Space D198, Fourth Floor Grand Central Palace.

Look us up and remember you may be lucky enough to win the very machine you like best. Don't forget the contest will be on at both Shows.

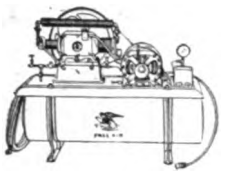
This is the Getting-in-on-the-Ground-Floor Day in Chalmers

Most men who have made money have not made it in a hurry. But most of them will tell you they got in on the ground floor.

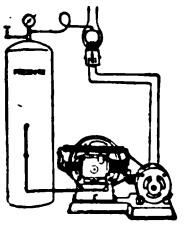
Here is the Chalmers now being built by Maxwell men, now being guided by Maxwell plans, now being financed by Maxwell money.

Ground floor time? Yes.



For those plans that have made Maxwell dealers prosperous as these figures show:

Maxwell dealers MADE *in 1913-1914 over* $2,500,000
Maxwell dealers MADE *in 1914-1915 over* $4,700,000
Maxwell dealers MADE *in 1915-1916 over* $8,000,000
Maxwell dealers MADE *in 1916-1917 over* $12,000,000



are going to win for Chalmers dealers, just as sure as the sun is going to rise tomorrow.

Already the movement towards Chalmers has begun. You may wake up some fine morning and find your strongest competitor has the Chalmers account.

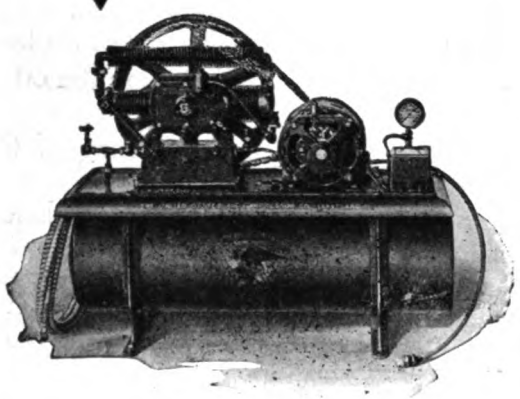
De Luxe Two-Stage Complete Automatic Unit
Capacity, four cubic feet per minute. Self-contained. Runs from lamp socket.

Two-Stage Units with Tight and Loose Pulley
for line shaft drive. Equipment 31-T — capacity, four cubic feet per minute. Equipment 41-T — capacity, ten cubic feet per minute.



Complete Two-Stage Automatic Unit
Equipment 34—capacity, four cubic feet per minute. Equipment 44—capacity, ten cubic feet per minute.

Two-Stage Duplex Automatic Air Plant
Equipment 48 -capacity, twenty cubic feet per minute.

Portable Two-Stage Compressor
Equipment 35—capacity, four cubic per minute.

The U. S. Two-Stage De Luxe Automatic Air Unit

This is a garage and free air station compressor De Luxe, incorporating more improvements and refinements than any unit ever produced.

It exactly meets the demands of a large majority of garages as proved by the fact that more of this number are sold than all our other compressors combined.

The De Luxe is uneqalled in all 'round features. It maintains high pressure in great volume, is extremely quiet in operation, handsome in appearance, entirely automatic in operation, self-oiling, and requires only a minimum of attention.

To buy a De Luxe compressor means to obtain the best and be assured of long continued satisfaction. This outfit has been tried for you and found not wanting by thousands of garagemen thruout the country and by several corporations of international prominence who have found them so superior as to be adopted as standard equipment for all their installations.

The Leader of a Complete and Remarkably Successful Line

THE Two-Stage principle of operation as utilized in United States Air Compressors has been proven absolutely unequalled and the perfected compressor combined with various tank equipments until the line is now as complete as can be desired, incorporating units for every requirement.

The leading number of the United States line is described at length on this page and several of the other units referred to briefly. The De Luxe Unit is ideal for a majority of requirements; Equipment 48 Duplex suited for garages having unusual conditions, while Equipment 31-T or 41-T are of interest to those who wish to use line shaft drive. Several other units are manufactured and compressors without any equipment whatever may be purchased if desired.

In addition to U. S. Two-Stage Compressors a complete line of Single-Stage Compressors is manufactured as briefly described below. These are as efficient and highly refined as it is possible to produce under the Single-Stage principle.

Front View of the SHALER Roadlighter

Makes Night Driving Safe

The SHALER Roadlighter is not a dimmer—it is a lighter—yet it conforms to all no-glare laws.

The country is flooded with lenses of all kinds and descriptions. You know that most of them are merely made to sell. They simply diffuse the light so as to get by the law.

That is all right for the fellow in the other car. But how about you?

It simply means that the efficiency of the lights on your car has been lessened.

The motoring public has been waiting for a headlight front that performs two distinct functions:

1.—To prevent a glare from the lights on your own car.

2.—To get a *strong* driving light—so strong that no matter how intense the glare of the approaching car you will not be blinded, but can see the edge of the road clearly and pass safely without slowing down.

SHALER

It Shoots the Light Far Ahead

The prisms take the light which with an ordinary lens is spread and wasted along the sides of the road too far ahead of the car to be of any practical value and bend it, concentrating it as extra light on the road-bed.

Result: At a distance of say 200 feet ahead of the car the light on the road is approximately twice the intensity of that from a bulb of the same candle power projected through a clear glass headlight.

Pierces the Glare of Approaching Headlights

The light is so intense that it will pierce the glare from an approaching car and give a clear view of the side of the road when passing. This exclusive feature of the SHALER Roadlighter is of prime importance.

The light which ordinarily shoots up into the air and is lost is bent down and toward both sides by the inner portion of the diagonal prisms so that the most concentrated part of the light is converted into an intense beam effect along the sides of the road, such as could only be obtained by using a spot-light on each side of the car. This highly intensified light counteracts the glare from an approaching headlight and enables one to keep a clear view of the edge of the road and pass in perfect safety without slowing down.

Rays Penetrate Fog and Dust

With any lens which permits the light to come above the level of the headlight, the rays strike the fog or dust particles and form a curtain of back-glare between the driver's eyes and the road. With the SHALER Roadlighter all the light is held down below the level of the headlight, doing away with the back-glare so that the driver is enabled to see ahead to the full length of the rays. Discoloring the glass and thereby dimming the light for driving under ordinary conditions is eliminated by the efficient design.

Tested—Proved—Guaranteed

The reports of our own experts—the official tests made in various cities and states—the photometer and illuminometer tests made by Mr. F. A. Vaughn, Chairman of the Headlight Committee of the Society of Illuminating Engineers, have demonstrated beyond the shadow of a doubt that the SHALER Roadlighter is infinitely superior in every way, and that it is the only lens that makes night driving as safe as by daylight. *Every SHALER Roadlighter is sold under a positive guarantee of absolute satisfaction.*

C. A. Shaler Co.
Waupun,

Digitized by Google

Lights The Whole Road

You can now drive at night—with just as much safety—and just as fast as in daytime—without the delay and danger of slowing down and dimming your lights to allow another car to pass.

The new SHALER Roadlighter lights the entire road, from fence to fence, with a bright, white, evenly distributed light.

It has no glare—absolutely none—and the light beams are never more than 42 inches above the ground—at any distance from your car.

All of the light is evenly distributed on the road where you need it, giving brighter, safer night roads than you have ever seen before. It is approved by city, state and police officials everywhere and endorsed by leading accident insurance companies.

Unretouched Midnight Photograph

ROADLIGHTER

It Illuminates the Ditches

The outer portion of diagonal prisms bends some of the light down and toward both sides, giving a wide-spreading fan of light that illuminates the ditches clear to the fences.

It Is Easy to Keep Clean

The outer surface of the SHALER Roadlighter is perfectly smooth. There are no projections whatsoever on the outside to catch and hold snow, rain or dirt.

It Is Easy to Install

Since the outer surface of the SHALER Roadlighter is perfectly smooth; there are no projections against the rim of the headlight door to prevent proper seating. Therefore it is not necessary to know the diameter of the opening in the face of the lamp door.

Accurate Focusing Unnecessary

The prisms, which are at different angles with the smooth surface of the SHALER Roadlighter, deflect the rays so that there are no dark spots even if the bulb is not exactly focused.

It Is Legal Everywhere

The rays passing through the upper half of the lens are projected below the horizontal by the reflector itself and hence none of them are more than 42" above the surface of the road. The rays passing through the lower half of the lens are bent down below the horizontal by the diagonal prisms and hence are not projected more than 42" above the surface of the road—thus no light is wasted in glare and the SHALER Roadlighter complies with all no-glare ordinances.

Regular retail prices of the SHALER Roadlighter are $2.75 per pair for Ford size and smaller; $3.50 for larger sizes. Packed ten in a carton.

Limited Offer to Dealers Only

We want every automobile accessory dealer in the United States to try out a pair of SHALER Roadlighters on his own car—AT OUR EXPENSE.

THE 1918 McGREGOR LINE

The NEW McGREGOR COMBINATION SPRING BUMPER

Is All That Its Name Implies—The Very Latest and Best Bumper Made

Our different types of bars are made of High Carbon Steel. The Spring members, or arms, are made of High Carbon Spring Steel, and are fitted with universal adjustable brackets, applicable to any make of car, with extended frame, either front or rear.

This new bumper does away with the necessity of stocking a number of special front end bumpers, to fit Packards, Cadillacs, Dodges, and other cars with interfering mud or splash aprons. We make rear end bumpers with special designed arms, applicable to 99% of cars manufactured.

We have eliminated the Malleable Iron Arm, and now make an all Spring Steel Arm, insuring the greatest resilience and Shock-Absorbing qualities obtainable in a bumper.

Temme

SPRINGS FOR ALL CARS

DO all the lame cars drive to *your* door for Temme Springs and other things?

In most good towns, Temme Springs and Temme's Triple Action Service are known to be *as good as gold.*

Hundreds of repairers, who have "banked" on Temme and never lost, are putting up Temme highway signs today.

These signs *will* bring in business. Temme has tried them, so he *knows.* And now he offers *you* what won for him.

Temme Springs *"for all cars"* means just what it says—for all cars *since 1902.* Test us by naming the spring you need. Temme Triple Action Service will have it on the way to you the same day.

"For all cars" means *designed* for all cars to factory specifications. And so good are Temme Springs—so prompt the service—so fair the prices—that dealers in *all* cars now buy from Temme *in preference* to the car maker.

You need these springs, this service, these signs. They will make you money, bring new business, help you build the good reputation you are after.

If you delay you may lose this exclusive proposition. Write or wire us now, saying: "Send Temme Spring Service Station proposition at once."

JOHNSON
Shock Absorber

This is to remind you of the new model of the famous Johnson Shock Absorber—made by us. The only cure for a hard riding car is a pair of Johnsons. Temme Spring Service Stations make good money on them. Write now for our new proposition.

It Slides in the Slot

TRI-CO UNIVERSAL **RAIN RUBBER**

TO CLEAR THE WINDSHIELD INSTANTLY.

The TRI-CO RAIN RUBBER can be attached to any two-piece windshield. Less than a minute is all it takes to put on or take off. No holes to bore—no adjustments. The Tri-Co Rain Rubber slides in the slot—it clears the windshield—top, bottom and clean across, allowing driver to see on all sides and ahead.

A light touch works the Tri-Co. It slides like skates on ice, leaving the glass bone dry.

CAUTION: Be sure you are getting the original, patented Tri-Co Rain Rubber. The Rain Rubber that 80% of the auto supply and hardware jobbers are pushing. The Rain Rubber that is advertised twice a month in the "Saturday Evening Post."

TRI-CO Rain Rubbers sell on sight. Dealers sell as high as 30 a day, and you can too. Retail price, **$1.50**

Order NOW — through your jobber or direct from us. Ask about our SELLING AIDS.

TRI-CONTINENTAL CORPORATION, Buffalo, N. Y.

BIG WINTER PROFITS in H-B Battery Charging

Heavy Starter Service and excessive use of lights quickly drain the Storage Battery, and make battery charging a big source of Winter Profit to the H-B USER.

The H-B 500-Watt Battery Charger guarantees quick charging and large profits. Recharges 1 to 7 batteries at a time, at cost of 12c to 15c per battery. Autoists pay 75c to $1.50. At least $4.50 profit each capacity run.

$15 PUTS THIS MONEY-MAKER IN YOUR GARAGE

Balance in 8 monthly payments of $20 each, which earnings should easily more than pay. Write for full particulars or send initial payment of $15 with trial order. No risk. Absolute money-back guarantee.

HOBART BROTHERS COMPANY
Box D 12, TROY, OHIO

STOP REAR-AXLE TROUBLE

BY INSTALLING THE

BAILEY BALL THRUST

at left (gear) side of Ford and Chevrolet 490 Differentials to replace flat thrust washers

Rear axle breaks and difficulties are caused chiefly by the flat thrust washers at left (gear) side of differential wearing thin and causing drive and pinion gears to get out of mesh—creating great loss of power as well as breaks.

But the BAILEY BALL THRUST BEARING, made of carefully heat-treated materials and containing eighteen ¼-inch highest type balls, cannot wear thin, hence they keep gears in proper mesh, make them run smoothly and last indefinitely.

The Bailey bearing, by reason of the things it does, reduces friction in gears, consequently conserves power, and having a capacity for six times the maximum thrust, every bearing bears an unqualified guarantee that it will "stand up" under all conditions and hardships. Car owners should insist upon a Bailey Ball Thrust. It prevents trouble and saves expense. Dealers, repairmen and garagemen will recognize the advantages of a bearing of this type, and the profitable replacement business, as well as added prestige to be had by installing Bailey Ball Thrust Bearings.

Those not already carrying the Bailey in stock will promote their own interests by communicating with their nearest jobber.

Fits to a 1000th part of an inch

Sold through dealers and jobbers—List price, **$3.75**

TO ALL DEALERS

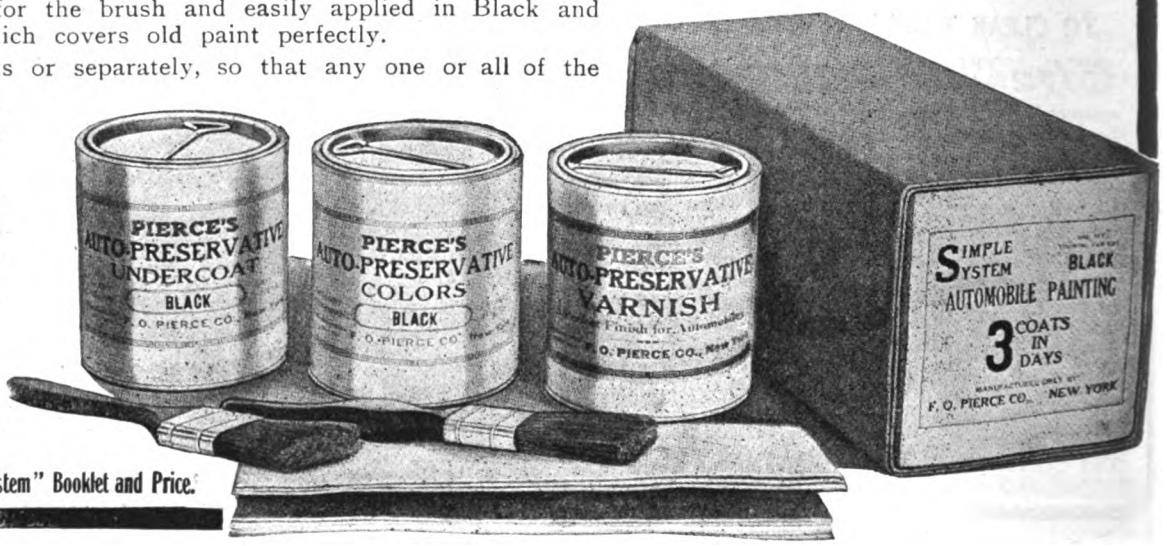
AND OWNERS OF CARS NEEDING PAINTING

Right now, with the Winter months coming, there is a mighty good opportunity for you to materially increase your profits if a dealer and save money if a consumer—

SIMPLE SYSTEM——three coat work——AUTOMOBILE PAINTING

ANYBODY CAN PAINT A CAR IN 3 DAYS

and completely obliterate the marks of the Summer's usage with a hard, wearing, beautiful surface on all parts.



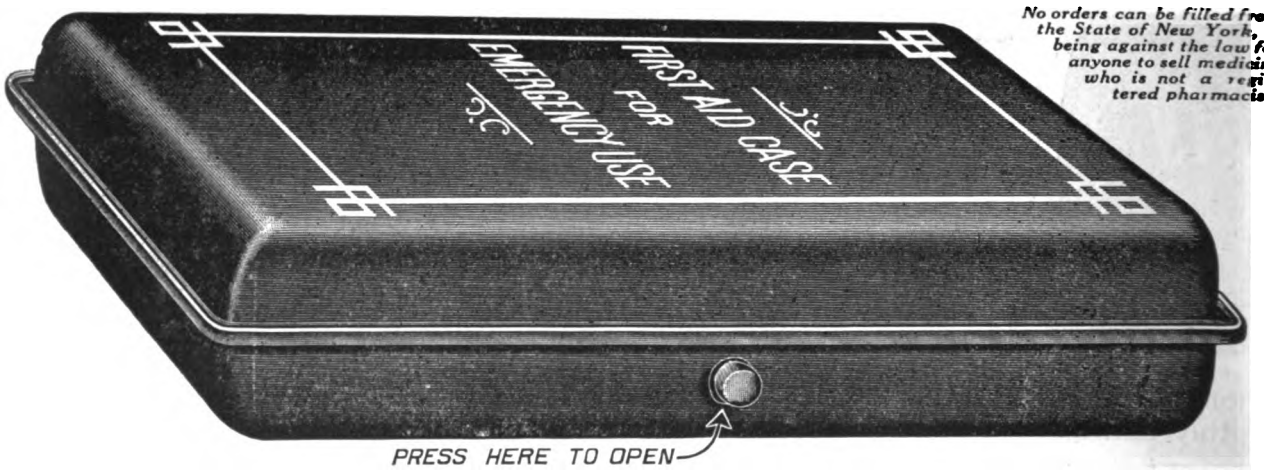
THE THREE COATS PUT UP IN SETS COMPRISING:

1 CAN AUTO PRESERVATIVE UNDERCOAT FOR FIRST COAT.
1 CAN OF AUTO PRESERVATIVE COLOR COAT FOR SECOND COAT.
1 CAN OF AUTO PRESERVATIVE VARNISH FOR THIRD COAT.
1 SHEET No. 0 SANDPAPER FOR SANDING LIGHTLY AFTER FIRST COAT IS APPLIED.
1 BRUSH FOR FIRST AND SECOND COATS.
1 VARNISH BRUSH FOR FINISHING COAT.
2 SHEETS No. 1 SANDPAPER FOR CLEANING CAR.

All ready for the brush and easily applied in Black and 12 colors, which covers old paint perfectly.

Sold in sets or separately, so that any one or all of the three coats may be had as needed.

Fifty years of experience behind every can. Quality guaranteed.



Manufactured Only By
F. O. PIERCE COMPANY,
12 WEST BROADWAY, N.Y.
Write for "Simple System" Booklet and Price.

IT MAY BE YOUR TURN NEXT

TO MEET WITH AN ACCIDENT ON THE ROAD.

It may also be a case of life and death to have the materials at hand for prompt treatment. We have recently made arrangements for a First Aid Case for emergencies especially for the readers of the AUTOMOBILE DEALER AND REPAIRER.

No orders can be filled from the State of New York, it being against the law for anyone to sell medicine who is not a registered pharmacist.

This case is made of heavy Bessemer Steel, size 11½x5½ and 2¼ inches deep, finished in Black Baked Japan and fitted with a strong instantaneous snap. It is strong enough to resist injury to the contents through accident or dampness.

The contents have been carefully selected to supply the needs in an emergency, before the doctor comes. All gauze, bandages and cotton have been prepared in aseptic laboratories under the same rigid inspection as those supplied to the United States Army and Navy.

The contents of this case consists of:—1 "First Aid to the Injured" Instructions. 1 Yard plain Sterilized Gauze for dressing large wounds. 10 Yards 2-inch Sterilized Gauze Bandages for dressing cuts and bruises. 10 Yards 2½-inch Sterilized Guaze Bandages for dressing cuts and bruises. 1 Package Sterilized Absorbent Cotton for pads and dressings. 1 Box Carbolic Salve for burns, sores, insect bites, etc. 1 Yard 1 inch Zinc Oxide Adhesive Plaster for retaining dressings and covering small wounds. ½ Ounce Tincture of Iodine, an antiseptic for immediate use on all wounds and abrasions. ¼ Ounce Spirits of Ammonia for use in case of shock, heart failure and faintness. ½ Dozen Safety Pins.

The retail price of this outfit is $2.50. We have made an arrangement with the manufacturers of such a liberal character that we can supply this outfit with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year, for the low rate of $2.50.

In case you have already subscribed for this year, we will send you one of these outfits, postage prepaid, on receipt of $1.50, which may be remitted by check, money order, or in any convenient way.

Every subscriber to the AUTOMOBILE DEALER AND REPAIRER should have one of these outfits. It may mean the saving of your own life or the life of some friend. ***ORDER AT ONCE AND THEN YOU WON'T FORGET ABOUT IT.***

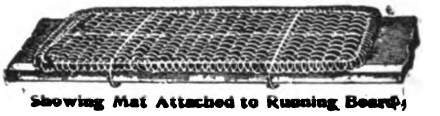
FRICTION DESTROYS EITHER METAL OR LUBRICANT

At points where metal-to-metal contact sets up friction in the mechanism of your car, bearings and gears will wear rapidly, unless protected by an adequate lubricant film.

TRADE MARK REGISTERED IN **NON-FLUID OIL** UNITED STATES PATENT OFFICE

inserts at just these points a lubricant film which can't be squeezed out, and remains constant, regardless of the temperature. **Non-Fluid Oil** is more effective and dependable than common greases, and is less expensive to use. Get a supply from your dealer, or write for free samples.



Packed only in orange-colored cans.

THE RED ROAD BOOK
250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER
$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about them parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

IDEAL HOSE CLAMPS

THE STANDARD HOSE CLAMP

appeal irresistibly to all customers that come into your store—they select such clamps as they wish out of the Counter Display Box—all the dealer has to do is to take the money.

The Ideal Clamp is the Only One That Makes a Perfectly Tight Joint

and can be applied under any circumstances or conditions. It acts concentrically and closes evenly around the hose. Its superiority over all others is conceded.

Wide adjustment by means of the double notch.

You'd be surprised at the money that can be made in handling Ideal Hose Clamps.

Dayton AIRLESS TIRES

DAYTON Airless Tire Construction

1. Live, resilient rubber piers absorb all jars and jolts. They are set at proper intervals, and squeeze down when obstacles are struck.
2. Five layers of toughest fabrics securely bound together by rubber, form a perfect bridge over the rubber piers. These layers support the piers, adding greatly to their strength.
3. Five more layers of loosely woven fabric correspond to the carcass of a pneumatic tire.
4. The tread is much thicker than a pneumatic tread, and is very tough and very flexible.

The 1918 Opportunity for Dealers

The one outstanding opportunity for profit in the accessory field for 1918, is the **Dayton Airless Tire.**

The experience of 50,000 owners of light pleasure and delivery cars, who have used these tires during the past five years, prove conclusively that they are as easy riding as pneumatics and absolutely will not injure the car, also that they are more economical than pneumatic tires.

Trouble-Proof and Long-Wearing

Dayton Airless Tires are trouble-proof. They can't puncture, blow out or rim cut. They do not contain inner tubes.

Ford owners have gotten 10,000, 12,000 and 18,000 miles of wear in all kinds of service and under all kinds of driving conditions. Nothing can happen to a Dayton Airless Tire but wear.

Big Economy Appeal

The completion of our new factory, one of the most modern and efficient in the country, together with a vastly increased capacity, enables us to greatly reduce the prices on these wonderful tires. And this new price makes Dayton Airless Tires the most economical that can be bought.

Grasp This Opportunity

To one responsible dealer in every community we offer our business-building local co-operation, backed by a national advertising campaign.

Write or wire today for details of our proposition.

Unlock the spark plug's extra profits

The Silvex Company announces the completion of the preliminary stage of a scientific study of ignition looking to—

—the lessening of Ignition difficulties;
—the more complete realization of the Motor's Power;
—the more thorough conservation of Gasoline, and
—the more exact designing of Spark Plugs for American and European motors.

UNLOCKING THE MOTOR'S HIDDEN POWER

HOW many times have you felt that you weren't getting from your motor ALL the power its designer BUILT into it? How many times have you felt that there was a HIDDEN store of power you weren't reaching? Banish it to yourself possible—on your lack of skill in "warming" the motor. Blamed it perhaps on the ignition—not on the quality of gasoline in your tank.

But have you ever found the answer? Have you ever reached that hidden store of power that means the motor's full efficiency both in performance and in economy of fuel?

Science and study lend a hand

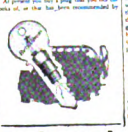
TO FIND that very answer—to "unlock the motor's hidden power"—has been one of the basic purposes of The Silvex Company in setting on foot and financing a scientific study of ignition which includes the motors of the leading cars of America and Europe and that purposes, on perhaps a larger scale than has ever before been undertaken, a thorough, scientific study of the role that spark plugs play in helping the motor give up its FULL power with the most economical use of fuel.

There is too little EXACT knowledge of ignition—of what goes on inside the firing chamber. There is very little knowledge of the ignition compared with what is known of the other phases of a motor's operation. No car engineer, no manufacturer has ever been able to say: "This is the EXACT plug for that motor." It can't be and today. But the initial stages of The Silvex Company's studies have been completed—and we can come very close to saying it—much closer than ever before. And we sincerely believe that when this scientific study is completed, we will have the knowledge to design plugs that will come closer to reaching the motor-designers' ideals than even they have hoped.

Why you don't get the Power the engineer Built into your motor

ALREADY that preliminary study has had its results. In place of the old, haphazard way of buying plugs, science has substituted a new and EXACT way.

This new way, however, is only the common sense way. Its only difference is that it is ACCURATE. Look at it in this light.

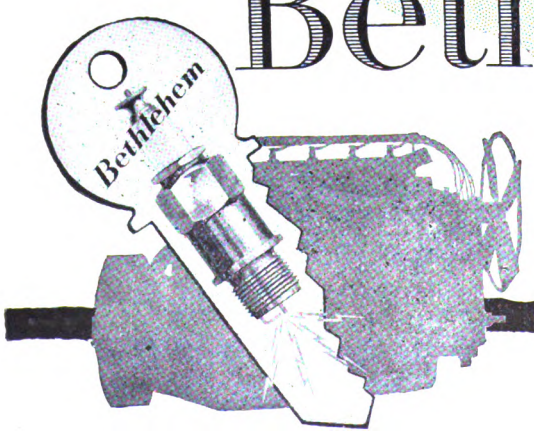


At present you buy a plug that you like the looks of, or that has been recommended by friends or a man at your garage, and so on. And you have it placed in your motor. But now, let's consider that motor. The engineer who designed it had in mind, let us say, a maximum of 80 horse-power at 2,500 revolutions per minute. He figured every detail of his design to produce that 80 h. p. He BUILT 80 h. p. into it. But you don't get it! Why?

The reason is this: The engineer counted on reasonably complete ignition—but on 100% ignition, for no motor has that yet—but on having, with very slight allowance, every charge of gas that is drawn into the cylinders, and ALL of EVERY charge, exploded and harnessed into energy.

In a motor there are EIGHT conditions that greatly influence a spark plug's operation. (See the eight conditions illustrated at bottom of following page.) These are variable. They change with the type and design of motor. And unless the plug happens by good fortune to fit all of these conditions in your motor, the plug cannot give you full efficiency. It may run your car—but not without wear through mis-firing, poor ignition, incomplete ignition, and the loss of part of the power you have a right to.

Why Plugs that fit by measure frequently fail to "measure up"



PICTURE those EIGHT conditions. If you will, as the manufacturer of a lock which open only to one key that FITS those all. That key is your spark plug. Only when your plug fits the EIGHT conditions as they exist in your

This is a photo-reduction of the two full pages in Collier's, Jan. 5th issue, that will place the Silvex message of a new and scientific method of spark plug selection before motorists at Show Time.

Bethlehem

Unlock the

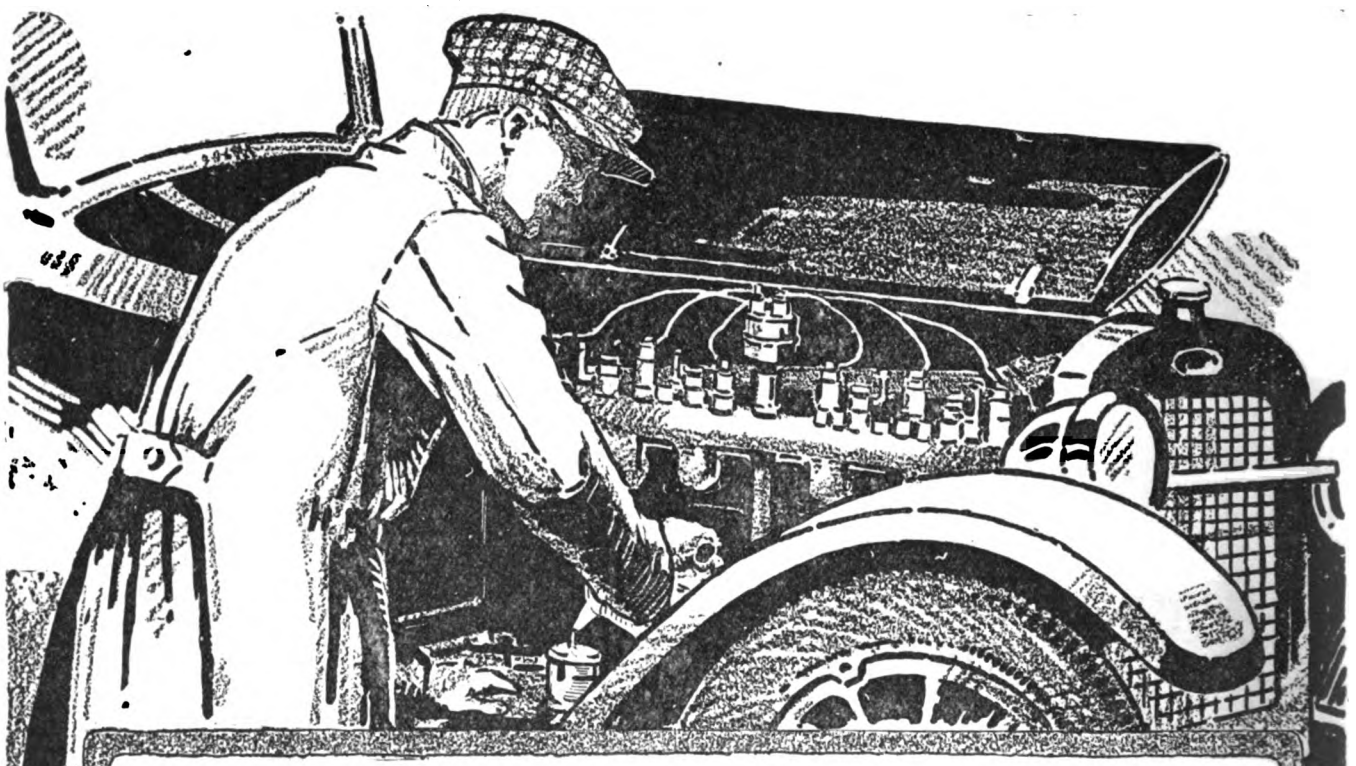
Digitized by Google

—in presenting the Silvex Consumer Advertising Campaign for 1918, we wish

to emphasize the important service rendered the car owner by the Bethl'em-Index — not only as it affects his selection of the proper size and style of spark plug, but as it influences his motor's performance *through the selection of a spark plug designed, built and basically right for the TYPE of motor he drives.*

This, we believe, is the first time that any manufacturer has developed a *definite* method of spark plug selection, based on a scientific study of the varying conditions within each type of gasoline motor as a substitute for the present, almost universal, haphazard way of buying any plug that fits the hole in the top of cylinder.

With the advances in the design, manufacture and marketing of Bethlehem Spark Plugs to be discussed later in these pages, the trade will find open to them new avenues of profit.



President

When You Fill the Crank Case

Often a car owner who is a stickler for proper carburetor adjustments, who uses scrupulous care in the purchase of tires, seems to throw caution to the winds when it comes to buying and using motor oil. As a result his car develops faults far more serious and permanent in nature than could ever be caused by the faulty adjustment of the carburetor or the purchase of a poor set of tires.

When you pour motor oil into the crank case be sure that it is an oil of the highest quality—an oil that will do properly the work you expect it to do. Such an oil is

TEXACO MOTOR OIL

When you use Texaco you are freed from those motor troubles developed by faulty lubrication.

Texaco Motor Oil, kept at the proper level in the crank case, will lubricate perfectly at all times and under all conditions.

Due to certain basic qualities in the crude from which it is refined Texaco Motor Oil cannot form a *hard* carbon crust. As a result scoring of pistons and cylinder walls never takes place when it is used.

Texaco Motor Oil affords a perfect seal between cylinder walls and pistons. Leakage of gasoline into the crank case is impossible.

Texaco Motor Oil maintains its original lubricating qualities after long usage. It does not deteriorate when subjected to high heat and thus become practically a non-lubricant.

When you buy motor oil buy Texaco. The safest way, the best way, is in one or five gallon cans. The clear, clean color of Texaco will help you to recognize it.

—The Quality Mark of Good LEATHER

The HLB mark on leather is the equivalent to "Sterling" on silver, or "Tiffany" on jewelry. The HLB mark is your assurance that the goods are the *best* at the price. Truly, HLB is the quality mark of good leather. It is your protection, and your customer's protection—for this company resolutely stands back of every price of its merchandise, and guarantees it unreservedly.

HLB leather goods are *not* being cut in quality to meet the acute leather situation. Quality is being upheld—that HLB jobbers and dealers will not destroy the faith that customers have in them.

HLB Wetprufe

Flat Fan Belting

Every auto supply dealer has daily demand for a high quality flat fan belting. **Wetprufe** is filling that demand for thousands of live dealers. **Wetprufe**, made of specially tanned oak leather, is heat, oil and water proof. In 50 ft. rolls, from ½ in. to 1¼ in. widths. You can recommend **Wetprufe** to *any* customer.

Vee Sol

Fan Belting

Vee Sol Belting is a "V" shaped solid leather belt designed for "V" pulleys. Made in any thickness, carefully and solidly cemented, and either bradded or sewed thru center with heavy linen thread. Guaranteed not to crack. 25, 50 and 100 ft. spools, in ½ in., ⅝ in. and ¾ in.

Cut Lacing

HLB Rawhide Cut Laces are made from carefully selected stock. By actual tests they have proved strong and tough. Uniform in thickness, width and tensile strength. Ideal for lacing radiators and tire boots. Put up in 100 ft. bundles of lengths convenient for automobile use. The following sizes are offered: ¼ in., 6-16 in., ⅜ in., 7-16 in., ½ in., 9-16 in., ⅝ in., and ¾ in.

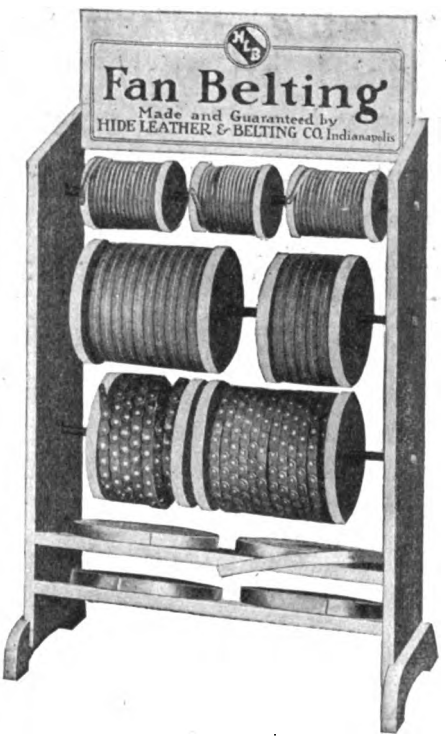
HLB Wetprufe

Wetprufe Ford Fan Belts are made in same high quality as **Wetprufe** Flat Belting; laps are carefully cemented, and stitched with heavily waxed linen thread—a perfect joint. This is the best Ford belt on the market. A quick seller that creates and holds customers. Made endless, with quick attachable, or clipper fasteners.

HLB VEE FLEX

A Laminated "V" Fan Belting, for grooved pulleys. Each lamination both underlaps and overlaps the other, and is securely riveted. Practically noiseless in operation—a giant for strength. 50 and 100 ft. spools, in ½ in., ⅝ in. and ¾ in.

Leathertex

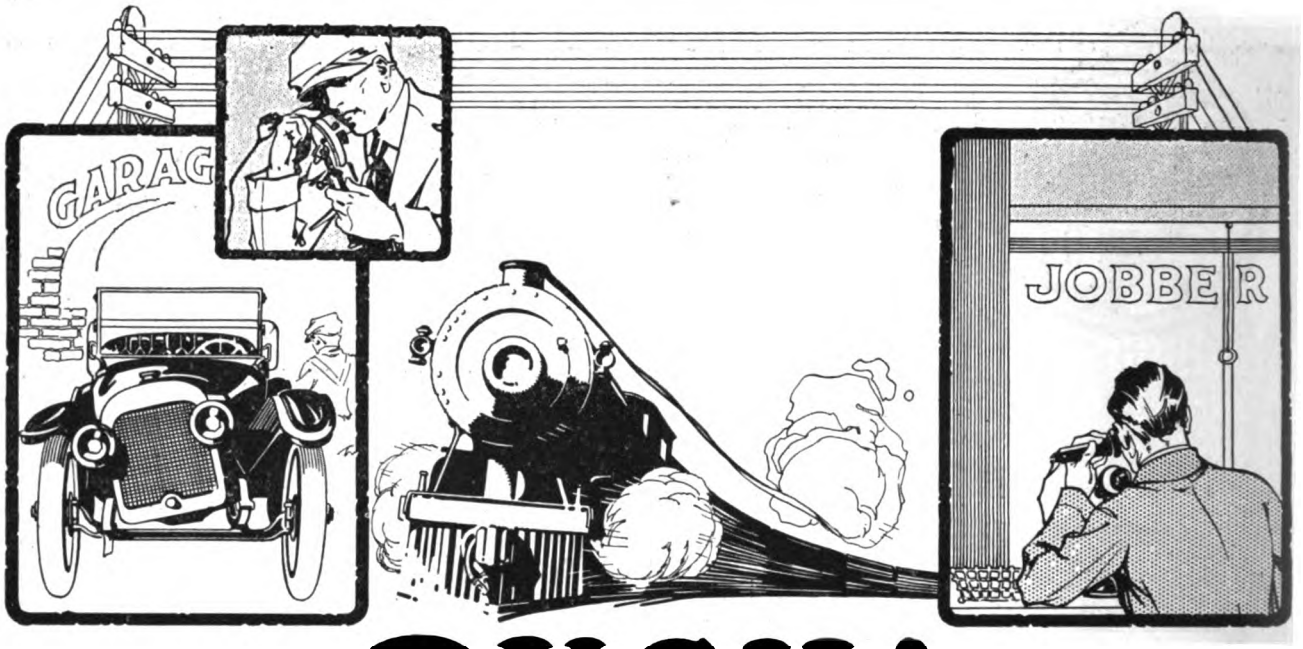


Cone Clutch Facings

Leathertex is a combination of carefully selected, specially tanned leather and textile—really merged into one element under 3,000 pounds hydraulic pressure—with a leather face for the clutch, and a textile backing next to the cone.

More durable than solid leather—more resilient than solid leather—retains its shape longer and better than solid leather. It is absolutely uniform in tensile strength and thickness. Made for all makes and models of cars.

A Better Display Rack
To Help You Make More Sales



You'll make more belting sales if your stock is well displayed. Our special rack (illustrated) is furnished free to dealers ordering a general assortment of HLB belting. With this rack your belting stock is in one compact form, easily handled, and convenient to display to customers. Rack is 3 feet high, 2 feet wide, and 1 foot deep. Made of wood, surmounted by steel sign lithographed in colors. Let us know what belting you desire, and we'll make up assortment to suit.

DEPENDABLE

FREE AIR WITHOUT OIL

Chicago Show Exhibit
Armory Balcony Spaces 23-24

Better Service Brings You More Trade

Auto owners have awakened to the fact that all Free Air Service is not alike. They are demanding PURE AIR for their tires because they have learned that oil rots tires and that AIR FREE FROM OIL means less blowouts, fewer punctures, greater tire mileage, less repairs and a great saving in up-keep every month. Cater to the demands of auto owners —give them what they want. Make your place the most popular in town by furnishing

CURTIS AIR
FREE FROM OIL

Curtis Compressors are the result of 25 years experience in the manufacture of high grade pneumatic machinery. They are reliable, dependable, require practically no attention, are economical to operate, guaranteed to stand up under the severest strains of hard usage and furnish a continuous supply of cool, pure, clean air. While others claim to furnish air free from oil, Curtis is the only Garage Air Compressor with the controlled splash oil system—**our own exclusive patented device** which prevents flooding the cylinder with more oil than it needs or can use—and eliminates all danger of forcing oil into the air line. Curtis Air is pure air—free from impurities—free from oil—the kind of air that makes tires last longer and pleases every patron.

Curtis Compressors Pay For Themselves

They build business—hold your old trade—bring new patrons to your door—and by the superiority of your Free Air Service, create a feeling of confidence in the quality and reliability of your entire stock. And more than that—a Curtis Compressor will save you big money by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools and serving you in many other ways.

5 Sizes—125 Combinations

There is a Curtis Compressor to meet the requirements of your business in every way—just the size, arrangement and price to please you. It will pay you to investigate. Ask your jobber—or cut out and mail us the attached coupon TODAY.

What can you say for the Spark Plugs you carry?

"That they seem to give satisfaction? That you have heard no complaints? That certain car manufacturers equip with them exclusively?"

Such statements prove nothing. Any plug will spark an engine. What the car owner wants is power, responsiveness, quick pick-up, low fuel consumption—the kind of service that is unfailingly delivered by Rajah Plugs.

Are these mere claims? Ask the drivers of racing cars. Look over the equipment of the winning cars for the past 16 years.

Rajah Plugs have stood the gruelling tests of racing motors, airplanes and speed boats for years.

Their record is your sales argument and your guarantee of satisfaction to all who equip with Rajah Plugs.

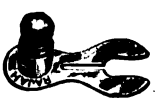
Stock Rajahs and Rajah Terminals and build up a real plug business.

RAJAH *SPARK PLUGS*

RAJAH TERMINALS AND ADAPTERS

are furnished so that Rajah Plugs can be used on any car not equipped with the Rajah type of Clip Terminal. Any size exchanged if desired

Rajah Regular Clip Terminal
Adjustable to any cable. With the extra collar supplied fits any make of plug.



Rajah Thumb Nut Terminal
Adapter for Dodge, Ford, Hup. Hudson, Maxwell, Mitchell, Packard Twin Six, Pullman.

Rajah Ferrule Clip Terminal
With any size ferrule required. Fits any make of plug with the extra collar supplied.

Rajah Packard Terminal
Adapter for Packard 4 and 6 cylinder.

Rajah Stud Terminal
Adapter for Buick, Chevrolet, Oldsmobile.

Rajah Ball Terminal
Adapter for Franklin.
Special type for Willys-Knight.

THE 1918 McGREGOR LINE

The NEW McGREGOR COMBINATION SPRING BUMPER

Is All That Its Name Implies—The Very Latest and Best Bumper Made

Our different types of bars are made of High Carbon Steel. The Spring members, or arms, are made of High Carbon Spring Steel, and are fitted with universal adjustable brackets, applicable to any make of car, with extended frame, either front or rear.

This new bumper does away with the necessity of stocking a number of special front end bumpers, to fit Packards, Cadillacs, Dodges, and other cars with interfering mud or splash aprons. We make rear end bumpers with special designed arms, applicable to 99% of cars manufactured.

We have eliminated the Malleable Iron Arm, and now make an all Spring Steel Arm, insuring the greatest resilience and Shock-Absorbing qualities obtainable in a bumper.

SHALER

5 Minute Vulcanizer

Mends Tubes in 5 Minutes

Easy to Use—Easy to Sell

Every buyer of a SHALER 5-Minute Vulcanizer becomes a booster! Every motorist who buys one shows it to his friends—gives them a demonstration—because it is such a wonderful thing.

This means big sales for you. As soon as you start selling the SHALER 5-Minute Vulcanizer, your customers will spread the news. You will quickly notice new faces in your store—new customers passing their money across your counters.

Complete Outfit

The dozen patches and combustible discs that go with the vulcanizer are soon used up—and the motorist comes back to you for more. He pays you 75 cents for every dozen of these units. You make a good profit.

With 6 Round and 6 Oblong Patch Units— $1.50

Can you realize what a big repeat business this means for you? Can't you see how it will bring car owners into your place for additional "ammunition"—who will also buy other goods? And that is what you need to build up your business.

Place Your Order With Your Jobber NOW!

Don't delay! The enormous demand for SHALER 5-Minute Vulcanizers has exceeded our factory capacity to make deliveries. We are building a large 3-story addition to our plant. But—to make sure of prompt shipments—place your order with your jobber now—specifying date of shipment desired.

Complete catalog of full line of SHALER Vulcanizers for Motorists, Garages and Repair Shops mailed on request.

Temme SPRINGS FOR ALL CARS

DO all the lame cars drive to *your* door for Temme Springs and other things?

In most good towns, Temme Springs and Temme's Triple Action Service are known to be *as good as gold.*

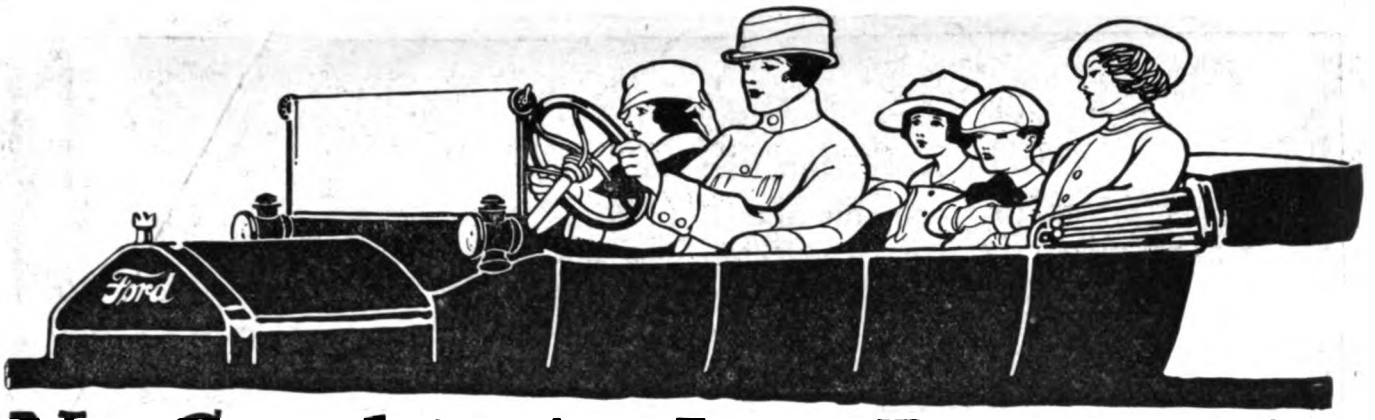
Hundreds of repairers, who have "banked" on Temme and never lost, are putting up Temme highway signs today.

These signs *will* bring in business. Temme has tried them, so he *knows.* And now he offers *you* what won for him.

Temme Springs *"for all cars"* means just what it says—for all cars *since 1902.* Test us by naming the spring you need. Temme Triple Action Service will have it on the way to you the same day.

"For all cars" means *designed* for all cars to factory specifications. And so good are Temme Springs—so prompt the service—so fair the prices—that dealers in *all* cars now buy from Temme *in preference* to the car maker.

You need these springs, this service, these signs. They will make you money, bring new business, help you build the good reputation you are after.



If you delay you may lose this exclusive proposition. Write or wire us now, saying: "Send Temme Spring Service Station proposition at once."

JOHNSON Shock Absorber

This is to remind you of the new model of the famous Johnson Shock Absorber—made by us. The only cure for a hard riding car is a pair of Johnsons. Temme Spring Service Stations make good money on them. Write now for our new proposition.

TRIPLE ACTION SPRING CO., 79 East 28th Street, CHICAGO

Digitized by Google

No Cranking—Just Riding!

Motoring loses its lure when a woman has to perform the hard labor of cranking.

Where the powerful, invisible, obedient sinews of electricity attend to the cranking, the joys of motoring are multiplied and driving becomes all pleasure.

Electric-cranking of Ford cars attains its highest perfection in the new, but already famous,

A-B-C
STARTING & LIGHTING SYSTEM FOR FORD CARS
TWO UNIT SIX VOLT

Experienced Ford dealers no longer experiment with incompetent Ford starters. They concede, and thousands of A. B. C. owners concede, that this greatest of all Ford accessories conforms more closely to Ford engineering and construction than any other starter in the field.

All over the world, in all weathers and all climates, the A. B. C. starts any Ford and lights any road at pressure of button.

Simple, compact, easiest to install, longest lived. Puts Ford starting in the same class with the highest priced cars.

Weight evenly distributed on both sides of engine by units. No drag or strain on motor from starting or generating. Noiseless in operation. A fibre, leather, and metal belt, moving in a V-type pulley, gives the highest pulling contact. Guaranteed efficient and mechanically correct.

Ford dealers, who have not yet brought to their customers the overwhelming advantages of the A. B. C., should at once fill out and mail the attached coupon, and learn the terms of our generous 1917-1918 dealer proposition. Once an A. B. C. dealer, always one.

A. B. C. Starter Co., Detroit, Mich.

A. B. C. STARTER CO., Dept. H, Detroit, Mich.

Trade protection and consumer satisfaction distinguish this accessory line

BECAUSE the commercial success of any accessory depends on proper distribution, we believe protection to the trade is essential. We sell only to the legitimate jobber who in turn stocks the retail dealer—and allows him generous discounts even on very small orders. This means quick turnovers, dealer enthusiasm and more profit for all concerned.

Consumer demand—another important essential—depends on consumer satisfaction and consistent advertising. To prove that Johns-Manville accessories give satisfaction it is only necessary to point to Johns-Manville Non-Burn Brake Lining, the Johns-Manville Fire Extinguisher and the Johns-Manville Speedometer. Each excels in its own field through perfection of design and dependable quality. Ask your jobber or our nearest branch for complete information.

S. A. E. Standard

This Screw Plate is very popular among Automobile Accessory Jobbers and Garage Men. It is designed to meet the requirements of the Repair Shop and it does to perfect satisfaction. The O. K. Hammered Dies in this set actually cut easier and much cleaner threads made than with the old style dies. This is entirely due to the extra chip clearance and oiling space provided.

Catalog 8-B tells the whole story.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

NATIONAL RUBBER FILLER CO.
208 College Street **MIDLOTHIAN, TEXAS**

25¢ each

CONSIDER THE TERMINAL

Why should motorists demand an efficient ignition system and reliable plugs—and disregard the source of most ignition troubles and annoyances—loose connections?

Vibration and jar won't loosen the connections—in fact the contact gets firmer if that connection is made by a

HANDY TERMINAL

GRIPS LIKE A VISE

—and you can make a good profit educating motorists to the fact.

The jaws of the HANDY are threaded on the inside and engage the thread of the plug center bolt. Drawing up on the ring with the first and second fingers (see illustration) compresses the steel spring; the jaws spread—and the plug is released. Reversing the action clamps it again. No nuts to tighten or loosen. No tools required.

The magneto cable is made fast by a ferrule—an integral part of the terminal. The stripped wire is firmly held by a brass clip. It can't work loose. Made in three sizes to fit every make of plug.

Here is an accessory without competition, moderately priced, nationally advertised, a necessity to the motorist if he expects no-trouble ignition. You can sell one for each cylinder. It's a good winter seller, too. If your jobber can't supply you, send us his name. Your requirements will be taken care of promptly.

VANDERPOOL COMPANY - SPRINGFIELD, OHIO

No Back Pressure with the Petry Cut-Out

PATENTED

SIZES 1½ in. to 3¼ in.

PRICES $4.00 to $6.00

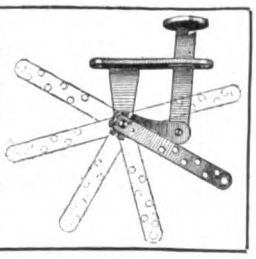
Inside dimensions of the cut-out at every point are larger than the inside dimension of the exhaust pipe, and no air pockets can be formed that might cause back pressure.

Quickly and easily installed, having eight points of adjustment—and once applied, its position is permanent.

Gas-tight joints. Adjustable spring cannot anneal, being well away from all heat. No fluttering of valve. No strain on exhaust pipe. Gases are discharged through a flaring opening which intensifies sound, facilitating tuning up of motor.

Easy to operate—no complicated parts to get out of order. A size perfectly suited to every car.

The Petry Universal Pedal Pat. Pending



Six different positions.

Adjustable to pull or push; for any use for which a pedal is required.

Muffler cut-outs; any style, kind or size.

Accelerator. Exhaust Whistle or horn. Heater valve.

The only pedal on the market that will meet all requirements. Made of high grade steel with special processed GUN-BARREL FINISH, not plated.

PRICE 75 CENTS EACH

"NORMA" BALL BEARINGS

(Patented)

The "best" car—the "best" truck—the "best" engine—they may all be condemned, may be rendered useless, by ignition or lighting apparatus which fails to measure up to their standards of quality. A good car, a good truck, must be consistently good—good in every minute detail, serviceable in every feature which makes for serviceability.

The standardization of all high-grade magnetos and lighting generators on "NORMA" Ball Bearings is an example of engineering consistency. The makers of these accessories, seeking maximum serviceability in their product, have availed themselves of the proved "NORMA" serviceability.

Be Sure—See that Your Electrical Accessories are "NORMA" Equipped

These Books Answer Ten Thousand Questions About Automobiles!

5 Volumes 2400 Pages 2000 Illustrations Tables & Diagrams

You Need Them in Your Business

Every Dealer, every Garageman, every Repairman, every Car Owner needs this wonderful set of books—the most complete, practical, **helpful**, up-to-the-minute auto books in existence. They tell you—**instantly**—anything and everything you want to know about all kinds of automobiles and garage work.

Automobile Engineering

5 Volumes, Flexibly Bound in Genuine Morrocco Leather, Gold Stamped

Recognized everywhere as the final authority on automobiles, their operation and repairing. Almost two entire volumes on latest Ignition, Starting and Lighting systems. 2,400 pages (5¼ x 8¼) and 2,000 illustrations, tables, diagrams, etc.

Everything About Automobiles, Including:

Explosion Motors; Welding; Motor Construction and Repair; Carburetors and Settings; Valves; Cooling; Lubrication; Fly-Wheels; Clutch; Transmission; Final Drive; Steering Frames; Tires; Vulcanizing; Ignition; Starting and Lighting Systems; Wiring Diagrams; Shop Kinks; Commercial Garage Design and Equipment; Electrics; Storage Batteries; Care and Repair; Motorcycles; Commercial Trucks; Glossary.

50c a Week If You Decide To Keep Them

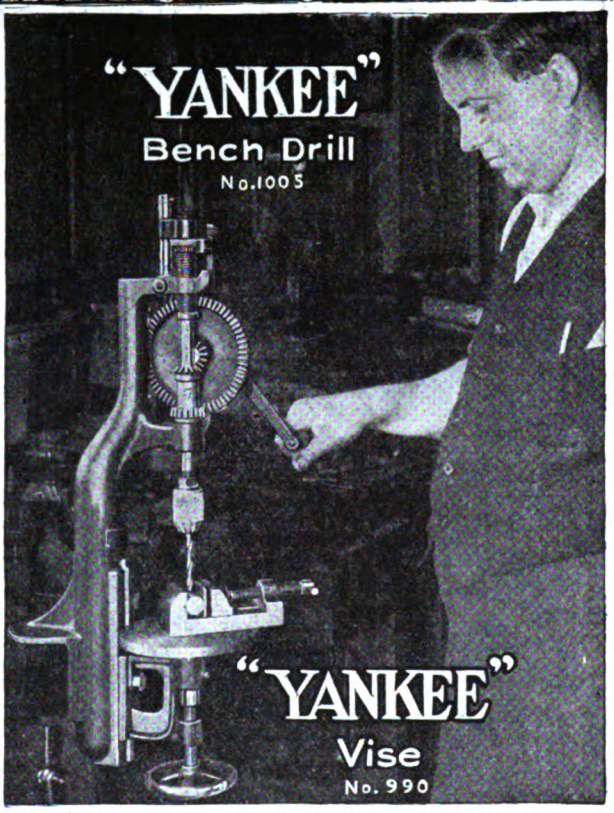
Just your name and address on the coupon brings the entire set for 7 days' examination. You pay only net shipping charges when they arrive. If you decide to keep them, send only $2.00 within 7 days and then $2.00 a month—50c a week—until the special price of $17.80 has been paid.

Free Consulting Service

With each set we give you free, a year's Consulting Membership in the American Technical Society. The regular price is $12. Put your problems up to our Staff of Experts, for one entire year.

Send No Money—Just the Coupon

American Technical Society, Dept. A-7551, Chicago, Ill.



Please send me the 5-volume Automobile Engineering for 7 days' examination. I to pay net shipping charges. If I decide to buy, I will send $2.00 within 7 days and the balance of $2.00 a month until $17.80 has been paid. Then you send me a receipt showing that the $25.00 set of books and the $12.00 Consulting Membership are mine and fully paid for. If I think that I can get along without the books after 7 days' trial, I will return them at your expense.

"YANKEE" BENCH DRILL NO. 1005 DRILLING A CYLINDRICAL PIECE HELD BY "YANKEE" VISE NO. 990.

Speed Up The Job

With labor scarce, you must look to **multiplying man's power.** You need tools that require less skill, less hand adjustment, less labor, that produce greater results—tools that **any** workman can operate with speed and efficiency.

This "YANKEE" Bench Drill takes over the "thinking" required in the operation of ordinary tools. It takes care of itself! The "Yankee"

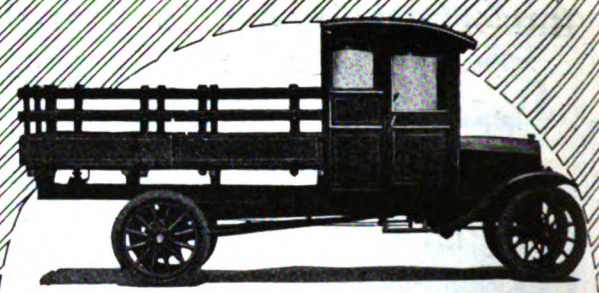
Automatic Friction and Ratchet Feed

does away with uncertain hand feeding. Maintains just the right feed throughout, whether in hard or soft metals, large or small holes. Accident-proof! Saves drills; gears can't jam or strip; feed is automatically thrown off (at extreme top and bottom), letting spindle run free. Quick, accurate and 50% more work assured!

"YANKEE" Bench Drill

No. 1003—One speed. Height 10¾ in. 3-jaw chuck holds round shanks up to ¼ in. diameter. Price at factory, **$10.00.**

No. 1005—Two speeds. Height 28 in. 3-jaw chuck holds round shanks up to ½ in. diameter. Price at factory, **$16.50.**



"Yankee" Vise No. 990—For use with Bench Drill. Sets level on bottom, end or sides. V-groove holds round pieces tight and parallel. Swivel jaw for taper work. Jaws open 3 in. Price **$2.20.**

Your Dealer Can Supply You

TIRE TROUBLE

TIE UP TO

BRAENDER TIRES

BRAENDER Tires made an unequalled record for tire endurance in the first Official Smith Trophy Coast to Coast Run over the Lincoln Highway. Raoul F. LeMat, accompanied by Miss Margaret Gale and Stanley James, left New York Jan. 5, 1915, in a Stutz and a National equipped with Braender Tires. On April 5, 1915, they finished the 5,286-mile run at Los Angeles *without a tire change.*

No harder test of tire quality, no stronger proof of sound construction could be conceived; and yet, the Stutz turned right around and covered the return journey on the same set of Braenders—*without a tire change.*

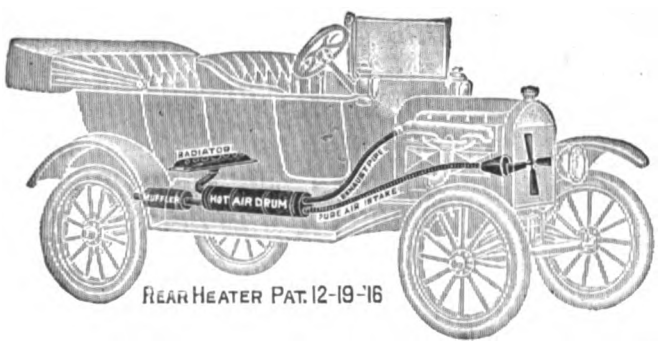
The Meaning of *Presto*

Pat. 12-19-'16
FRONT HEATER



When you think of Presto, think of bigger business and profits. That is what Presto accessories mean to you.

The Dealer and Jobber that handles the Presto line builds up a good and profitable business.

The Presto heating system for Ford cars makes cold weather driving as pleasant as in the springtime. No fuel expense to bother about. Original cost is the only expenditure. An attachment worth while.

The Presto engine heater does away with the expense of heating the entire garage. The new swivel hook makes it possible to place the heater anywhere under the hood, and deliver heat where most needed. Does away completely with starting difficulties on cold mornings.

Learn more of these fast-moving accessories. Write for complete catalog of over 100 Presto accessories.

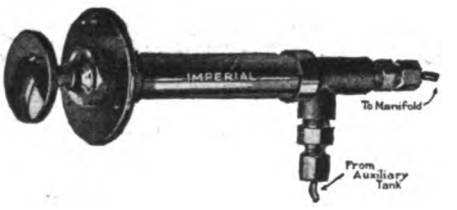
Eliminate All Risk By Using Free From Acid KANTFREEZE



Every motorist has been on the lookout for an anti-freeze preparation that not only is better and more economical to use than alcohol, but that positively will insure the "Safety-Always" kind of winter protection to radiators.

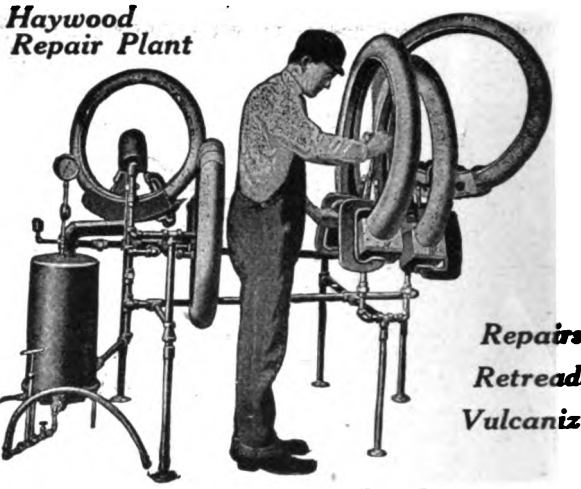
Here it is—**Imperial Kantfreeze Radiator Compound**, the fully-tested, high quality product of a manufacturer with a national reputation for perfecting devices and preparations that make winter-time motoring more of a pleasure and less of an expense.

At one-third the cost of alcohol you can use Kantfreeze and know absolutely that all winter long you will be free from a radiator freeze-up. Moreover, alcohol is vital to victory now. You should not use it.

Don't depend on an unknown anti-freeze preparation to give good results. Rely on Kantfreeze, which is 99% pure.

Imperial Kantfreeze Compound is absolutely free from acid. It cannot cause corrosion or injure the rubber hose or other parts of the cooling system. When used according to directions you will be assured of a factor of safety far greater than with any other compound or liquid on the market. One application is sufficient for the whole winter if properly applied.

Motorists everywhere know of the Imperial Primer—the marvelous device which **Starts Your Motor Instantly in Cold Weather.** Simple to operate and fits on every make of car. Price for complete outfit, including Auxiliary Tank, is **$6.00.**



DEALERS:

Imperial Kantfreeze Radiator Compound and the Imperial Primer are a strong combination for swelling winter-time profits. Write today for details of our proposition.

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

A Giant's Might in Fighting Friction

New Departure Ball Bearings are designed and built for *big* and little jobs—for the *heavy* as well as light duties of industry.

These bearings are delicate only in their extreme precision. In service they are giants of strength and conquerors of friction.

The secret of their power is also in the design of the raceways—so that the balls are supported on definite areas—and because the steel is both tough and resilient, absorbing terrific shocks without becoming abnormally distorted.

New Departure Ball Bearings are worthy parts of the heaviest and most powerful trucks and motors.

"Engineering Bulletins"—125 data sheets with binder free to designers, builders and buyers of motor vehicles.

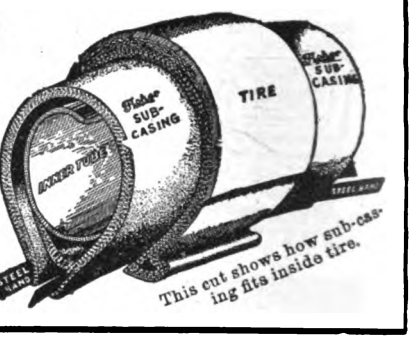
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.



A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

FISHER MANUFACTURING CO.

1706 PAYNE AVENUE, :: :: CLEVELAND, OHIO

This cut shows how sub-casing fits inside tire.

DON'T dislike the old car just because it looks its age. Give it new life with

"F-S" "Evernew" Auto-Body Enamel

It will give a bright, attractive finish that is hard and durable. Easily applied and doesn't show brush marks. Eight standard colors—special shades to order.

Send for color card

SPARK PLUGS
THAT
GO *AND* MAKE GO

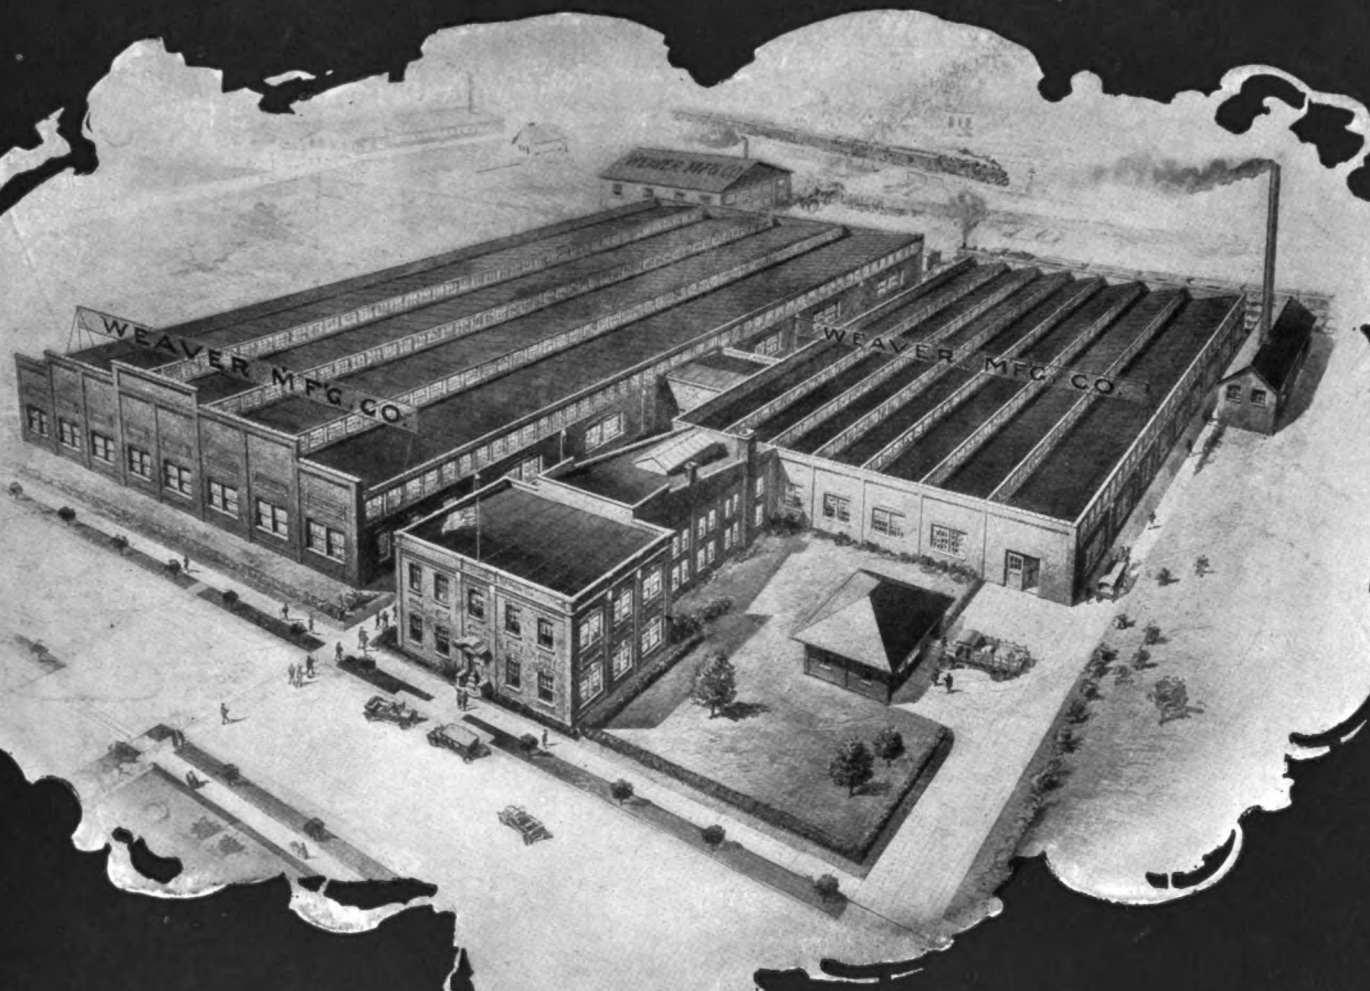
The spark plugs you sell must not only make cars GO; they must themselves GO—must sell easily.

REFLEX SPARK PLUGS

GIANT REFLEX Spark Plugs are standard equipment on the thousands of White Trucks now in the war zones. The scene above, taken "somewhere near Verdun," shows an example of the service these REFLEX equipped Whites are called upon to deliver.

because they are individually made to make good. They not only GO—but they stay sold. More than that, they bring the customer back for more.

Every extra cent we put into super-strength porcelain and non-pit electrodes, means profits for dealers handling them.



REFLEX Spark Plugs are built for endurance regardless of how rough the usage. As standard equipment, they are helping make possible the gruelling service thousands of White Trucks are now giving in the war zones.

REFLEX dealers can supply every demand because there is a Reflex for every requirement; automobiles, trucks, tractors, motorcycles, motorboats, etc.

Write for dealer proposition that tells why REFLEX Spark Plugs GO.

ALADDIN

with all his MYTHICAL magic never performed a miracle that could surpass the REAL and marvelous development of the WEAVER AUTO TWIN-JACK from it's small beginning, into the present full and complete line of

WEAVER
GARAGE EQUIPMEN

In a few short years the Weaver Factory has developed into the largest institution in the world devoted exclusively to the manufacture of equipment for the garage.

The reason is THIS:

We have spared no expense to make our products RIGHT in every detail, and we have adhered strictly to a real business policy which we feel is fair and equitable to all

WEAVER MFG., CO.

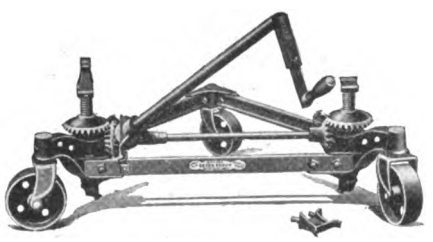
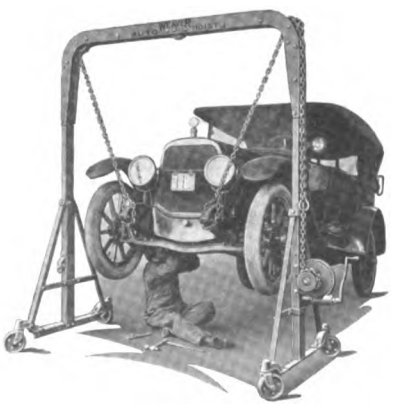
WEA
GARAGE-



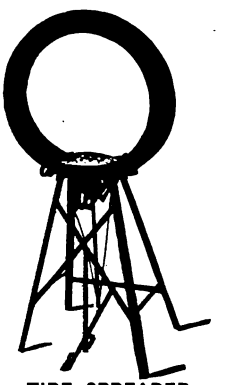
AUTO TWIN-JACK, Regular

Every Item in the Line Is A Real Necessity.



EVERY ARTICLE of Weaver Garage Equipment is the product of very careful study of Garage conditions and requirements.

We make nothing except Garage Equipment—therefore the entire talent and energies of our designers and mechanical engineers are devoted exclusively to diagnosing the garage situation and to developing and perfecting equipment to best meet the peculiar requirements of that ever-increasing industry.



AUTO TWIN-JACK, Extra Heavy

Each article is a time and labor saver—and consequently a money maker for the garage owner or repairman.

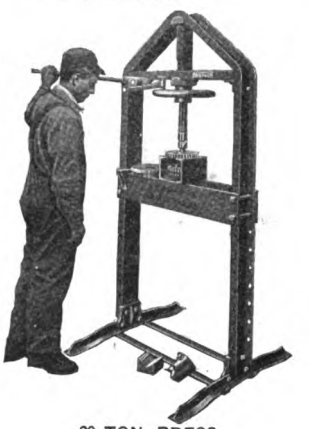
VER EQUIPMENT

Efficient Service Requires Proper Equipment

THE ACTUAL NEED of Weaver Equipment in Garages and Auto Repair Shops is greater today than ever before.



Competition in garage and repair service is becoming keener every day—therefore the shop which is prepared to give the most prompt and satisfactory service is the one that will draw the most satisfactory class of patronage.

Then another point—

The shortage of help—due to the War—is going to make it necessary for the live garageman to install every available labor saving device,—that means a FULL LINE of Weaver Garage Equipment.

Facts Worth Knowing

Concerning the "Weaver Line"

ONE VERY SIGNIFICANT FACT IS THAT EVERY ARTICLE IN THE WEAVER LINE IS CONCEIVED AND PATENTED BY MR. WEAVER—THE PRESIDENT OF THE COMPANY. Consequently, each article precisely fills the requirements of some phase of the automobile repair industry which our researches showed needed relief.

Also, by the patentee of our products being a member of the firm, we are not compelled to pay out tens of thousands of dollars in the purchase of miscellaneous patents, as would otherwise be true. Therefore, we are able to give greater value for the money in both materials and workmanship, in addition to superiority in design.

WE ARE SPECIALISTS IN THE DESIGN AND MANUFACTURE OF EQUIPMENT FOR THE GARAGE, WE MAKE NOTHING ELSE. For this reason Weaver products represent more of real value to the garageman than could be true were we endeavoring to market a few promiscuous articles as a "side line."

BY HAVING A LINE OF A DOZEN DIFFERENT ARTICLES ALL OF WHICH ARE APPLICABLE TO EVERY GARAGE, WE ARE NATURALLY VITALLY INTERESTED THAT EACH PURCHASER OF ONE OF OUR ARTICLES RECEIVE THE GREATEST POSSIBLE DEGREE OF SATISFACTION. This frequently is not the case with concerns marketing a few diversified articles with no "second sale" possibilities.

OUR LINE IS CARRIED BY PRACTICALLY EVERY LARGE JOBBER OF AUTOMOBILE ACCESSORIES FROM COAST TO COAST. This means that you have a supply of our goods near at hand for prompt delivery no matter where you may be located.

We were the first to come to the relief of the garageman with a line of equipment especially designed to overcome HIS peculiar difficulties. Today we are the largest institution of this kind in the world —which is positive proof that Weaver Quality is appreciated.

Expert Advises Against Usual Practice of Waiting Until Spring to Overhaul the Car

Predicts Scarcity of Skilled Mechanics Owing to War and Demands of Government—Says Owners Should Have All Work Done this Winter

BY CLIFTON EGERT

If you are one of those automobile owners who store their cars during the winter months and make it a practice to await the arrival of spring before giving a thought to the repair and overhaul of your machine, you are due to be disappointed, for the war is going to change the old order of things. So when the nice, balmy days arrive and your thoughts turn to the joys of motoring and you take your car to the garage or repair shop to have that leaking cylinder fitted with a new piston and rings, do not be surprised if you are informed that you will have to wait weeks before even getting your machine in the shop let alone having the work completed. If you wax indignant and go to another shop the chances are that you will not fare any better. If you ask for an explanation the repairman or garageman will make use of that stock expression, "On account of the war."

Factors Responsible.

If one stops to analyze conditions he will see that the answer is a practical one, for it should be borne in mind that the output of new motor vehicles will be greatly reduced this year. Some state that it will be 20 per cent. less, while others estimate that it will be 40 if not more by the time warm weather arrives. As a result of this decreased output, conditions brought about by the war, thousands of owners will have to be content with a used vehicle; that is, will have their car overhauled, repainted and newly equipped.

Conditions Abnormal.

This means that the garageman, repairman, painter, etc., will be called upon to handle in addition to the usual tremendous volume of spring business that created by those owners who cannot obtain new cars and will have their used machines thoroughly overhauled. Ordinarily this would bring about an abnormal condition, a volume of business that could not be satisfactorily handled even if sufficient help could be obtained as in normal times.

Scarcity of Trained Labor.

In other words, the owner of a repair shop or garage handling repair work is to be confronted by the same problem as other industries and that is by a shortage of skilled labor. There is no denying the fact that there is going to be a scarcity of skilled automobile mechanics in this country if such a condition does not already exist. And conditions are not going to improve as time goes on; in fact, the scarcity of trained automobile repairmen is being noted by those who keep closely in touch with such matters.

Digitized by Google

Why Shortage of Labor.

As an example of how skilled automobile mechanics have responded to the call or have been drafted is the statement of a well-known automobile manufacturer, who says that over 15 per cent. of his employees, practically all skilled mechanics, are serving with the colors. These conditions obtain to a greater or lesser extent among the garages and repair shops throughout the country. They exist in the large service station as well as in the country and crossroads garage, and many an owner will inquire for Bill or Pete to learn that he is driving a truck or an ambulance or engaged in helping Uncle Sam construct his fleet of airplanes.

Requirements of Government.

Few automobilists realize how many thousands of skilled and semi-trained automobile mechanics will be required by the Government to keep its fleet of mechanical transports and airplanes in condition. It is estimated that at least 10 men will be required in back of the lines for each airplane and that these will largely be men who will be drawn from the automobile industry, from the factory, garage, repair shop and service station.

No Time Like the Present.

While it is probable that the scarcity of trained automobile repairmen will not be pronounced until spring, or at least until the big fleets of trucks and airplanes are ready for shipment abroad, there is every reason to believe that the best interests of all will be served if the automobile owner will have any needed repairs made at the present time, when the services of skilled workmen can be obtained and the work more thoroughly performed than would be possible during the rush season. The tendency of the average owner to wait until spring before having any needed work done frequently means that only those absolutely necessary repairs are made. By this is not meant that the work is not properly done. It does mean that a long list of waiting cars and impatient owners creates such a demand for service that a great many details, details insignificant at the time but capable of shortening the life of the car, are generally neglected.

Transportation Facilities Congested.

There is another angle to the situation, one that should not be overlooked by the owner or the garageman or repairman, and that is the advisability of taking into consideration the possibility of delay in obtaining parts, stock, material, etc. With the transportation facilities of the country taxed to their uttermost to meet the requirements of the Government there is every reason to believe that shipments will not be as prompt as formerly. Consequently motorists contemplating repairs or replacements requiring the attention of out-of-town concerns will do well to order early if they would avoid disappointment.

The fact that motor trucks must be used in large numbers to solve the transportation problems of the country means that a new army of mechanics must be trained to care for these transports. Many will be recruited from the repair shop and the garage, attracted possibly by the lure of higher wages, all of which will serve to reduce the number of repairmen available for the repair of the passenger car.

So if you do not intend to repair or overhaul your car yourself, but will rely upon the services of the expert at the garage or repair shop, do not wait until spring before arranging for the work. Consult your repairman now and if he can do the work, as he probably can, have it done now. By so doing your machine will not only be thoroughly and properly overhauled, but its services will be instantly available. Not so with the "wait until spring" owner. There is a disagreeable surprise in store for this class of automobile owners.

SAVE AND SERVE.

Necessity of Careful, Provident Use and Expenditure.

When the first Liberty Loan was launched the cry was heard that this is not a thrifty nation and that the Continental peoples have outstripped us in the practical application of individual savings to national finances. True, at the beginning of this war, when our export balance reflected in increased billions our prosperity, we showed little disposition to imitate the careful Frenchman. But those who complained in the early months of 1917, on the eve of the first Liberty Loan, of our unwillingness to save have forgotten what this nation did when put to the test in the days of the Revolution and the Civil War. The first two Liberty Loan campaigns proved incontestably that the American people know how to "save and serve." That they will continue in this self-sacrificing, forward-gazing spirit is not to be doubted. They have heard and heeded the President:

"Let every man and every woman assume the duty of careful, provident use and expenditure as a public duty, as a dictate of patriotism which no one can now expect ever to be excused or forgiven for ignoring."

Our war bills, growing heavier as the climax of the world contest draws nearer, cannot be met however by the same measure of thrift that characterized the first months. The United States must reach and surpass the mark set in France and Great Britain. In England, one bank alone, the London City and Midland, reports that its depositors applied for $451,198,000 of the last war loan, or considerably more than one-half the amount standing to their credit. This may give an insight into the compelling pressure of patriotism upon all classes of persons in England, for the London City and Midland reaches all social ranks. It must not be supposed that these English subscribers drew all their half-billion from the bank in order to pay for their bonds. Such a step would have resulted in grave trouble. This tremendous total could not have been lent to the Government without the most extraordinary thrift and self-denial.

Keep the Rims Graphited.

The displacement of tires from detachable rims and the removal of demountable rims from wheels will be made easy by keeping the rims, etc., clean. More or less moisture finds its way to the bearing surfaces, particularly in the winter, and rust follows. Make a mixture of powdered graphite and oil, a thick paste, and smear the parts. Then remove the surplus and polish with a cloth. The graphite will fill the pores of the metal, resist the action of the water and make changing of tires or wheels an easy matter. The mixture will not injure the rubber of the shoes.

A CHEMICAL RECTIFIER.

Method of Charging Storage Batteries From A. C. Magnetos.

BY GEORGE A. LUERS.

With those machines utilizing alternating current machines or magnetos for ignition, storage batteries employed as an auxiliary source of current supply must be removed when in the need of recharging.

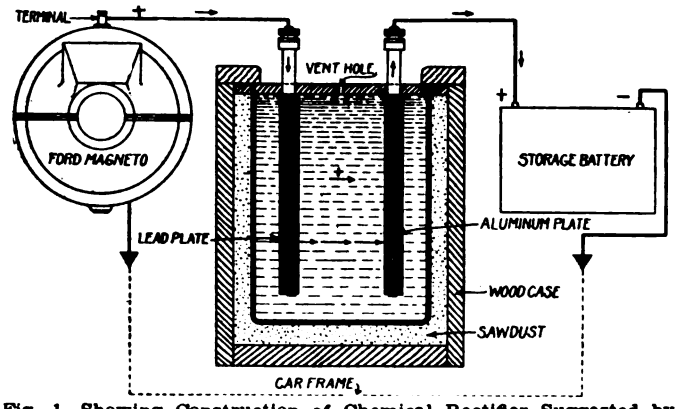

Fig. 1—Showing Construction of Chemical Rectifier Suggested by Mr. Luers.

An alternating current cannot be used for charging a battery unless a mechanical or chemical rectifier be employed. Mechanical rectifiers are expensive, but a simple chemical converter may be constructed for about a dollar.

The Principle Involved.

The aluminum and lead plate rectifier, which is one of the simplest controls for alternating current, is probably the least expensive of any.

The principle upon which this type works is that a current can pass into an aluminum plate from a lead plate, but not from the aluminum to the lead plate, when these are suspended in an acid solution.

As positive + current represents the flow from lead to aluminum and negative —, the flow from the aluminum to lead, it is realized then that the negative — current is checked and the rectifier acts as a valve through which flow is only possible in one direction.

Eliminates Cut-Out.

A feature of this type of rectifier is that the principle overcomes the need of an automatic cut-out to prevent the current flowing back from the storage battery into the magneto when the engine is not running. As a precaution, however, against a possible leak of the current when the engine is at rest for long intervals, a switch can be installed between the storage battery and the car frame where the current is grounded.

How Constructed.

The rectifier as shown in the accompanying illustration consists of a container for the electrolyte. A glass or rubber is used. A wide-mouthed quart fruit jar provides a convenient cell and suspend in this one lead plate (polished steel or carbon may be used) and one plate of aluminum.

The plates are attached to a lid of some insulating material (glass or rubber) and so separated that their surfaces will be about an inch or more apart. The cell is packed in sawdust or any soft substance in a wooden box to protect it from possible breakage when it is used on the automobile.

The Electrolyte.

The electrolyte used in the cell can be either a concentrated solution of neutral ammonium phosphate or of sodium bicarbonate. The concentrated solution of sodium bicarbonate is less expensive than the other and gives nearly as good results.

The aluminum plate used must be of this material only and not some composition having small portions of aluminum. The connections should be made as shown in the sketch at Fig. 1, in which the arrows show the flow of the positive + current from the magneto through the rectifier into the positive + terminal of the storage battery.

Should Stand Overnight.

As the coating on the plates when immersed in the solution is the rectifying agent, the cell when first made should be allowed to stand overnight or for a day before using to allow the plates to coat.

After long and continued usage the plates should be removed and scraped to remove the accumulations.

A small rectifier is not likely to be overloaded by the type of generator used for automobile purposes, but much foaming of the liquid is indicative of an overload and larger plates and container should be used when this condition exists.

Can Increase Capacity.

Where insufficient current is supplied, the rectifying capacity of the cell may be increased by using two lead plates, connected with a single aluminum plate between them as shown at Fig. 2.

This arrangement leaves less current for ignition purposes, where the current for this purpose is taken direct from the magneto as with the Ford system for example.

Enriching the Mixture.

The modern car is equipped with either a dash or steering column control; that is, a device for shutting off the air supply at the carburetor or for increasing the fuel supply for starting. Earlier models are equipped with a wire or cable running

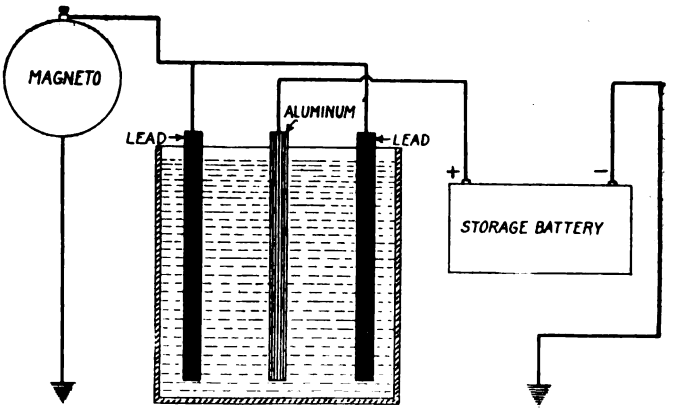

Fig. 2—Illustrating Rectifier Increasing Charging Rate at Loss of Current Supply for Ignition.

from the carburetor through an aperture in the radiator to the front of the machine. When the car has none of these devices the last named method can be used by connecting the priming cord or wire with a small metal ring. Always protect the radiator from chafing by the wire by using a fiber tube. Run the wire through the tube.

The High-Tension Magneto vs. the Battery System of Ignition

Ignition Expert Explains in Non-Technical Language the Principles Involved and Makes a Comparison Between the Two Types

* BY J. A. WILLIAMS

The natural evolution of ignition in internal combustion engines from the hot tube to battery systems, then to the low-tension magneto and finally to the independent high-tension type of magneto, was accomplished through innumerable series of tests during the days of automobile engine development. These tests brought out the fact that the high-tension magneto gave the best results under all conditions.

The next demands on automobile engineers were for some means of starting and lighting. Mechanical starters and air pressure starters were followed by the electric starting and lighting systems and these have become universally adopted, adding, however, not only considerable first cost to the car but entailing a considerable charge for upkeep.

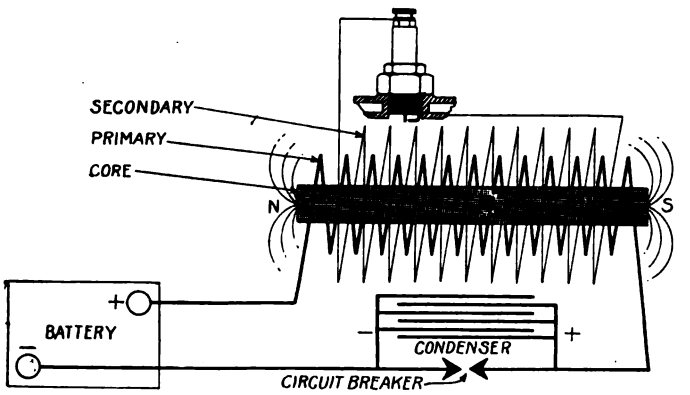

Fig. 1—Cross Sectional View Illustrating Functional Parts of Battery Ignition System.

The Commercial Aspect.

It was quite natural, therefore, for the car manufacturer to seek means to lower the cost of his car, to offset the added cost of electric starting and lighting equipment. With a storage battery as a source of current, one would naturally argue, "Why not a battery ignition system?" The result, especially among the popular-priced cars, was that most of them adopted battery ignition systems. The higher-priced cars, however, mostly continued to use the independent high-tension magneto. We find the status as to battery ignition among passenger cars this year to be that 58 models are using high-tension magnetos and 137 are using battery ignition. Trucks, however, almost universally are equipped with high-tension magnetos.

It is a regrettable fact that this change, from magneto to battery ignition, has given the general public the idea that perhaps battery ignition was just as good as high-tension magneto ignition, whereas a casual analysis of the situation shows the change was made for commercial reasons only.

In our engineering work, we have always had in mind the great difference between conditions of automobile operation and conditions of tractor operation. The tractor only resembles the automobile to the extent that a gasoline engine is used for motive power in both cases, and use is made of a transmission and differential, but right here the comparison stops.

Automobiles are built as light as possible, run on pneumatic tires on good hard roads, carry comparatively light loads and are equipped with engines of such size that they are probably operated 95 per cent. of the time at very low throttle opening. They are rarely ever called upon to develop their maximum output of power, and even then but for a few minutes at a time, and inasmuch as it is a passenger vehicle, very little thought or care is given to its fuel economy.

Tractors, however, work nearly all the time under full loads, operate steadily for hours at a time in dust and mud, and run over plowed fields under all weather conditions. Their operation is exclusively for profit. This means that fuel economy and cost of upkeep are extremely vital points. Reliability of operation is not just merely hoped for, but it is demanded.

For these reasons, the designing of a high-tension magneto for tractor work cannot be based entirely upon the experience gained in the automobile field. This applies not only to the magneto ignition system, but practically to every other accessory and part used on a tractor.

Comparison of Systems.

In accordance with the title of this paper, I have endeavored to treat both systems of ignition fairly, and absolutely impartially, from a scientific and technical standpoint. We begin with the principles of battery ignition and discuss the battery ignition system, and then in the light of these diagrams and explanations, we follow with a description of high-tension magneto ignition. We then give a comparison between the two types of ignition, concluding the paper by illustrating diagramatically how and why a hot spark causes the engine to produce more power and economize greatly on fuel consumption.

Electrical Terms Defined.

Before proceeding with the subject, it might be well to explain how a coil of wire is made to generate electricity. The only known way to generate electricity with a coil of wire is to create lines of magnetic force within its axis, or to remove magnetic lines of force from its axis, by decreasing the amount of lines of force, or, better still, by reversing their polarity or direction of flow. The greater the amount or number of lines of force your coil of wire surrounds, and the faster you can effect a rate of change in the quantity of them, the more voltage you will generate within your coil of wire.

It does not make any difference whether your coil of wire should be a spark coil, a dynamo, a magneto, or any other piece of electrical apparatus, this method of fluctuating the amount or reversing the direction of lines of force is the only known method of creating voltage or electrical pressure by means of the use of coils of wire.

The volt is the unit of measurement of electrical pressure, just as is the pound the unit of measure of steam or water pressure.

The ampere of current is the unit of measure of volume, just as is the gallon or cubic foot a unit of measure for fluids.

The ohm is the unit of resistance which opposes the flow of electricity.

We will now call your attention to Fig. 1, an outline view,

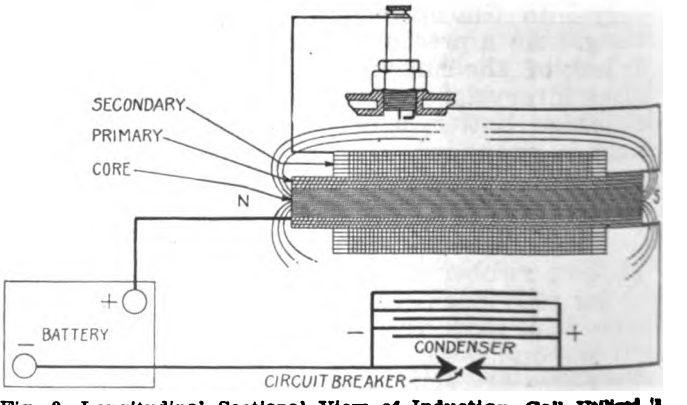

Fig. 2—Longitudinal Sectional View of Induction Coil Utilized in Battery Ignition Systems.

and Fig. 2, a sectional view of a battery ignition system. These views illustrate and show all of the functional parts, not only of one battery ignition system, but of all of them, irrespective of their different arrangement of parts or outward appearance.

Components of Coil.

In the spark coil there is a central core of soft iron wire. This iron wire core is surrounded by, or wound with, from 150 to 300 turns of insulated copper wire of comparatively large size and low resistance, and is called the primary winding. Outside of, and surrounding this primary winding,

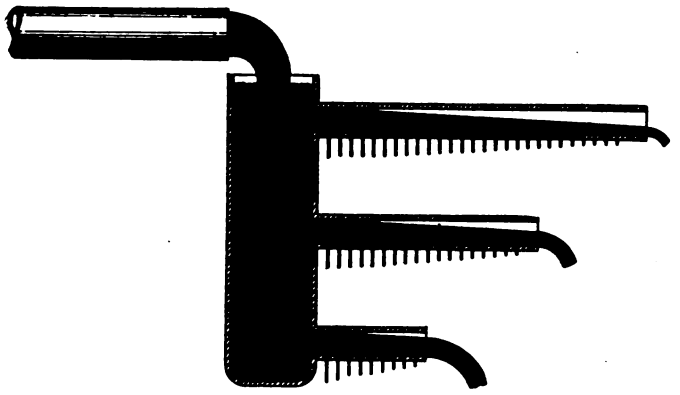

Fig. 2—Illustrating Graphically the Static Capacity of the Secondary Winding.

is another winding which consists of a large number of turns of very fine copper wire, usually from 20,000 to 30,000 turns, and is called the secondary winding, one end of which is connected either directly or indirectly to the frame work of the engine, and the other end of which is connected to the terminal of the spark plug.

Referring again to this primary winding, it, of course, has a switch in circuit, located at some convenient place not shown in the diagram, for turning the ignition on and off by opening or closing the primary circuit. It also has a circuit breaker or interrupter, as designated by the arrow heads in the diagram. This circuit breaker or interrupter is magnetically operated on the ordinary vibrating coil and is mechanically operated on other types of battery ignition systems. Connected to each terminal of this circuit breaker is a condenser, which is composed of several sheets of tinfoil. The even numbered sheets are connected to one terminal of the condenser and the odd numbered sheets to the other terminal. These sheets of tinfoil are separated and insulated from each other either by means of mica sheets or specially prepared paper.

Good vs. Bad Condensers.

There is in every ignition system two kinds of condensers, a good condenser and a bad condenser; the good condenser does the thing we want it to do, and is connected across the terminals of the circuit breaker or interrupter. The bad condenser does the thing we do not want it to do, and locates itself within the secondary winding of the coil and is technically called static capacity of the secondary winding. Inefficient ignition systems have a very large bad condenser, or a great deal of static capacity in the secondary winding. Good ignition systems have a very small bad condenser, and consequently very much less static capacity in the secondary winding. Having shown the various parts of a battery ignition system, we will discuss the function of the separate parts.

The storage battery simply acts as a source of current. The iron wire core serves to concentrate and direct the magnetic lines of force that the current circulating through the primary winding creates. The function of the primary winding is to form a path that the electric current can circulate, many times, around the iron wire core, and thus produce the magnetic lines of force in the core.

The Secondary Winding.

The function of the secondary winding is to generate a high voltage anywhere from 20,000 to 30,000, so that it will have sufficient voltage or pressure to jump the gap in the spark plug. The function of the circuit breaker, or interrupter, is to break the circuit and interrupt the flow of current when the current circulating around the core has reached its predetermined or ultimate value.

The function of the good condenser is to absorb the current that forms an arc across the gap caused by the separation of the circuit breaker points. It is surprising what a large amount of current a small condenser will absorb.

The capacity of a condenser depends upon two things: first, the area of metallic surfaces opposed to each other; second, the nearness together of those surfaces. In other words, the larger the surfaces involved and the closer together they are, the greater the capacity of the condenser to absorb current.

It is important in any ignition system to have a condenser of just the right capacity to absorb the current and stop the sparking at the points of the circuit breaker. The points, however, must be allowed to spark a little, just enough to keep themselves burnt clean.

The function of a spark plug is simply to create a gap in the cylinder of the engine for the spark to occur in. This gap should be of the proper width to absorb the maximum energy that the ignition system will produce.

It might be well, at this time, to explain the function of what we call the bad condenser, which insists on being present, to a greater or less extent, in every ignition system.

How Leaks Exist.

This bad condenser is located along every inch of wire of the secondary winding. The longer the wire in the secondary winding, and the more turns it has, the greater the capacity of the bad condenser. This absorbs the current, thus preventing the spark from being as hot as we would like to see it.

Fig. 3 illustrates further the action of the bad condenser, or the static capacity of the secondary winding. This shows three different lengths of water pipe, connected together at one end to a larger pipe, which is kept full of water. These pipes all have the same size holes drilled in them, and the same number of holes per inch length of pipe, thus creating leaks whereby the water gets away instead of running through the pipe.

Very little water comes out of the end of the longest pipe. Nearly all of it leaks away through the small holes. A greater quantity of water flows from the end of the next longest pipe. The shortest length of pipe has the greatest quantity of water flowing from its end.

Just imagine that these pipes are the secondary windings of different types of ignition systems, that the end of the pipe is the spark plug gap, and that the amount of water flowing from the ends corresponds to the current flowing across the spark plug gap. Also that the water that is leaking from the small holes represents the amperes of current that is being absorbed or wasted by the bad condenser, or static capacity of the secondary winding.

We will then realize how the secondary winding of an ignition system acts as a condenser and wastes the current we would like to get at the spark plug gap for ignition purposes. We will further see that the shorter we can have this secondary winding and still generate the voltage required to jump the spark plug gap, the more current we will have left to create heat in the spark.

We can compare these different lengths of water pipe, shown in Fig. 3, with three different types of ignition systems, as follows: The longest pipe to a battery ignition system; the next longest pipe to the old style or H armature type of high-tension magneto, and the shortest pipe to the most efficient design of high-tension magneto.

In the operation of a spark coil, current flows around the turns of the primary winding when the circuit breaker closes, creating and building up lines of magnetic force in the iron-

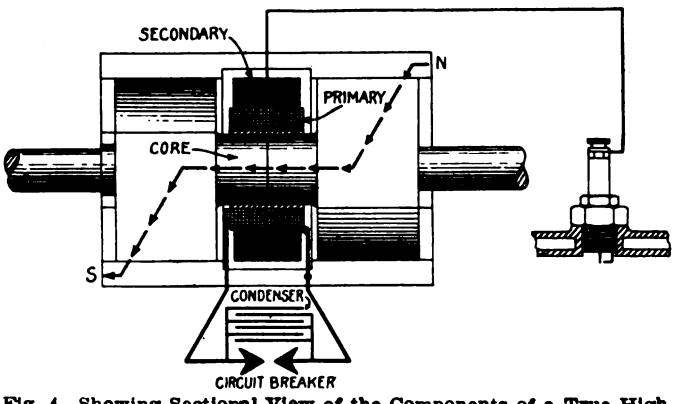

Fig. 4—Showing Sectional View of the Components of a True High-Tension Magneto.

wire core. Next the circuit breaker points open, causing the current that built up the lines of force to cease flowing. The lines of force in the core of the coil, no longer being maintained by the flow of current, fall or disappear, but in a much smaller period of time than it takes to create them. By disappearing they create electrical pressure or voltage

Digitized by Google

in the turns of the secondary winding. This cycle of operation is repeated every time the circuit breaker points close and open.

Defining Battery Force.

The action of a battery ignition system is just like lifting up a hammer and letting it fall on a nail. The only force

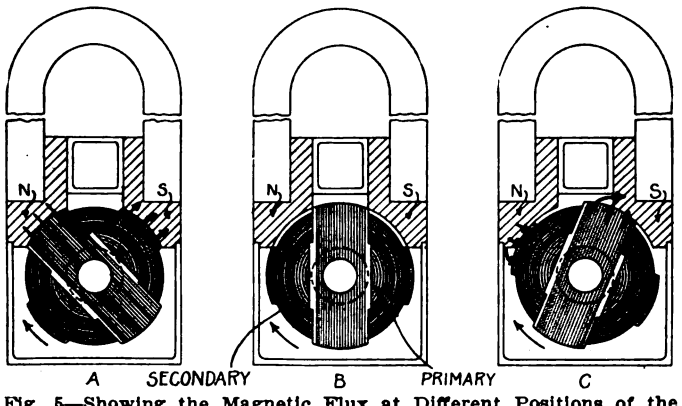

Fig. 5—Showing the Magnetic Flux at Different Positions of the Magneto Rotor.

which you have to apply to the nail is the power that the hammer exerts through its weight in falling. This is rather an inefficient way to drive a nail, is it not? We have no means in a battery ignition system to handle the lines of magnetic force any more energetically than to just let them fall, as the hammer falls on the nail.

The height which you raise the hammer can be compared to the number of lines of magnetic force built up in the iron-wire core, and their speed of disappearance compared to the force of gravitation that brings the hammer down.

Half of the magnetic circuit of a spark coil is the air. The lines of force produced in the core of the coil have to travel from one end of the core to the other.

Circuit Inefficient.

Air offers something like 280 times the resistance to the flow of magnetism as does iron, so that a battery ignition coil has an inefficient magnetic circuit, requiring a very strong current of electricity circulating around the iron-wire core in order to produce a very few lines of magnetic force.

The question might be raised as to why it would not be good construction to lengthen the iron-wire core and join its two ends together, in a ring, so that it would have a path of high magnetic conductivity in which a small amount of electrical energy could produce a large number of magnetic lines of force.

The reply to this question would be that it would then take a very long time for the electric current to rise to its full value, owing to the largely increased induction in the coil. Furthermore, after having raised the magnetism to the highest obtainable value, it would disappear very slowly on breaking the circuit, for lines of force in the core of the coil by their very generation create an opposing voltage, which tends to oppose the battery voltage and prevent its rapid rise to a maximum.

Spark coils for battery ignition systems must be made with straight iron-wire cores, in order to secure sufficient rapidity of action, consequently they must of necessity have an inefficient magnetic circuit.

If we could double the rapidity with which we vary the amount of these lines of force; or, if we could double the quantity of lines of force, we could then get along with half as many turns of wire on the secondary winding.

The effect of this shortening of the length of the wire in the secondary winding would be the cutting in half of the static capacity, or absorption of current by the secondary winding, consequently doubling the current delivered at the spark plug points without decreasing the voltage.

The more voltage that we can make one turn of secondary winding produce, the less surface we expose to absorption of the current produced and the larger the output of energy we get at the spark plug points.

In a battery ignition system we are compelled, on account of the limitations imposed by the speed of operation, to use an inefficient magnetic circuit, which generates a comparatively low voltage per turn of secondary winding. A large number of turns is required and a large surface must be exposed to the absorption of current through static capacity, resulting in the production of the skeleton of a spark at the spark plug points, leaving of the meat of the spark or amperes absorbed in the secondary winding.

Faults of System.

In battery ignition systems we find inherent faults as follows: First, they do not and cannot create enough lines of magnetic force. Second, they do not and cannot handle, with sufficient energy or speed, the few lines of magnetic force they do create.

In consequence of these two faults, they cannot generate sufficient voltage per turn of secondary winding.

Inasmuch as a low-tension magneto simply acts as a source of current and a circuit breaker and uses the same kind of a spark coil as a battery ignition system, it does not produce a much better spark; except it is, however, a much more reliable source of current.

If we can design an ignition system with all of its magnetic circuit composed of soft iron or steel, the result will be a very efficient magnetic circuit, thus permitting the generation and handle of a very large number of lines of magnetic force. We must, however, have means for causing the rapid disappearance or reversal of these lines of force.

Let us now look into the principles employed in the high-tension magneto, to see whether or not that device remedies any of the defects existing in the spark coil of a battery ignition system.

Principles of High-Tension Magneto.

Fig. 4 illustrates the working principle of a modern high-tension magneto, which is largely used in the tractor and stationary gas engine fields.

It consists of a soft iron core, a primary winding surrounding it, a secondary winding outside of the primary winding, a circuit breaker and a condenser; or of every functional part of a battery ignition spark coil.

Instead, however, of a storage battery we have permanent magnets. The permanent magnets are not shown in Fig. 4, as we are looking up from the bottom of the magneto so as to get a better view of the windings and core.

The core of the armature, which is the core of the winding, is round and short and stubby. It has two extensions on each end, so as to conduct the lines of force, from the pole pieces of the permanent magnets to the core of the winding, through the core of the winding and out at the opposite pole.

This core of the winding is located in the direct path of flow of the greatest number of lines of force from the permanent magnets; being made of the softest iron, it forms a good conductor; thus concentrating all the lines of force of the permanent magnets and conducting them to the center or axis of the winding.

The secondary winding is very short, because a large number of turns and a great length of wire are not necessary in this design.

The pole pieces, instead of being set directly opposite each other, have their centers spaced 90 degrees apart. The extensions of the armature core or rotor are also set 90 degrees apart, so as to conform to the location of the pole pieces of the permanent magnet. The shortest possible path thus exists for the magnetic lines of force to go from pole

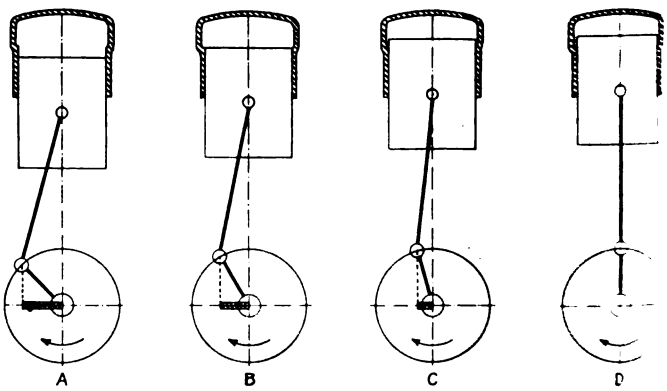

Fig. 6—Illustrating the Power Losses With Spark Occurring at Different Positions in Stroke.

piece to pole piece, and at the same time make all of them pass through the center or axis of the winding.

Fig. 5 is an end view of the same magneto: the air gap in the circuit is just as small or short as will permit of a safe running clearance of the rotor or core extensions.

In comparing the construction shown in Figs. 4 and 5 with that of the spark coil of a battery ignition system, we

Digitized by Google

see that we have enormously shortened the core of the coil, and in addition have almost entirely eliminated the long high-resistance air path of the battery spark coil, thus providing an easy path for a large number of magnetic lines of force.

Now let us see how we can compel the rapid disappearance of this large body, or number of lines of force by reversal of polarity, thus not only handling a very greatly increased number of lines of force, but also handling them at least twice as energetically as could be done with the battery ignition coil.

Fig. 5 A shows the rotor or core at rest. The magnetic lines of force are coming down through the wing of the rotor, are passing centrally through the round core and round winding, and are going up the core extension on the other side of the winding to the opposite pole of the permanent magnet.

In Fig. 5 B, the armature is shown in a different position, just as it is being rotated to the next position. Fig. 5 C shows the rotor in position that it occupies during the time that a spark is being delivered to the spark plug. The arrows are going into the core on the opposite or further side of the winding, then through the core, passing out on this side of the winding, showing that we have a complete reversal of polarity through the winding.

Advantages of Magneto.

Summing the matter up in a few words: A modern high-tension magneto corrects the inherent defects in a battery ignition system. It handles a much larger number of lines of force, the reversal of polarity increasing their rate of change.

This is doing just what will cause the generation of a higher voltage per turn in the secondary winding, thus permitting the use of a much shorter secondary winding, consequently exposing much less surface of wire to the action of absorption of current by static capacity, and cutting down the opportunity of the so-called bad condenser to rob the spark plug gap of the current necessary to give the greatest heat of spark.

Referring to this hammer and nail illustration, with this high-tension magneto, we can raise the hammer to a very much greater height and we can slam it down with a great deal more force, thus driving our nail efficiently and quickly.

Having shown why a battery ignition system produces a weak spark and a high-tension magneto system a hot spark, it remains to be shown how and why the hot spark will cause an engine to produce more power with less fuel consumption.

Value of Hot Spark.

Opinions differ among engineers as to whether a hot spark is any better than a weak spark. Some of them seem to think that a spark is a spark, and so long as it does not make a missed explosion we are getting all out of it that is possible. Nothing is further from the truth than that assumption. In practice we find that the weaker the spark is the slower the propagation of flame in the mixture, necessitating a much greater advance to the spark.

Further, the hotter the less early must it occur in advance of dead center, for there is a direct relation between the heat of the spark and the speed of flame propagation in the mixture.

Fig. 6 is a diagramatic view of an engine, cylinder, piston, connecting rod and crank throw, showing four different positions. The spark is supposed to be occurring at all these different positions. Fig. 6 A shows the spark advanced further than in any other diagram. This represents the engine firing with a weak or battery ignition spark. Note the shaded area projected down from the center of the crankshaft. This represents negative torque, or power using up fuel in an effort to run the engine backwards.

Fig. 6 B represents the engine firing with a still hotter spark, and consequently with less spark advance needed. The negative torque is now smaller, showing less fuel burned and less power expended in the wrong direction.

Fig. 6 C shows the engine in operation with a hot, powerful high-tension magneto spark, which is occurring still nearer dead center, wasting less fuel, generating more power in the forward direction and burning less fuel.

The Ideal Condition.

Fig. 6 D represents the ideal condition, which we have not yet attained, but will attain just as soon as we can create ignition sparks as hot as they should be. If we can get an ignition spark hot enough and large, the propagation of flame through the mixture will be so fast that we will not have to begin to ignite the mixture a long way ahead of dead center, as we do now, with the weakest sparks.

Would a steam engineer admit pressure to the cylinders as far ahead of dead center as a gas engine has to admit its pressure by starting ignition?

Steam is, of course, admitted to a steam engine slightly after it passes the dead center position. So will the spark ignite the mixture in gas engines and slightly after the crank passes the dead center position. This will obtain just as soon as the engine is provided with a spark that is hot enough to give the proper rate and speed to the propagation of flame through the mixture.

One might say to this, "Why, of course we have to advance the spark in order to get the greatest power out of our engine; if we operate the engine with too late a spark our engine will run hot and will not develop its full capacity of power."

That, of course, is true, for when igniting a mixture with a weak spark, its flame propagation is so slow that unless ignited a long way ahead of dead center, it will still be burning when the exhaust valve opens, and a great deal of the fuel will pass out through the exhaust unburned.

I cannot see how anyone can doubt the greater value of a hot spark over a weak one. Suppose one were going to kindle a fire in the stove or grate, and wanted to have that fire burning briskly within the shortest possible time; would it not greatly facilitate matters if plenty of good kindling were used, and if that kindling were lighted all over at once with a hot blow-torch flame?

In the cylinder of a gas engine we are kindling a fire. In a high-speed engine we must kindle that fire and burn up all the fuel in an inconceivably short space of time.

Perfect Spark Possible.

We are constantly doing a great amount of research work in our laboratory, and we believe that this ideal spark is not only a possibility but a probability. All the results obtained from our experimental data and research work lead us to believe that we are working in the right direction.

In conclusion, since we have seen that the modern high-tension magneto not only gives now but promises for the future so much better results than any type of battery ignition, is it not the part of wisdom for builders of engines to cleave to and encourage the development of that system of ignition which promises ultimately to solve their ignition problems properly?

Dragging Clutches.

Some types of multiple disc clutches, wet types, give trouble in cold weather unless the lubricant be changed to meet the changed conditions. This applies particularly to the old types of clutches, and when the trouble exists it may be remedied by thinning the lubricant with kerosene. The old oil should be displaced and the plates, etc., washed thoroughly with kerosene before renewing the supply of oil.

Proper Inventory of Stock is A Valuable Business Asset

Suggestions for Simplifying the Work and Methods for Computing Costs, Etc.—Mistakes to Be Avoided in Figuring Out Values

BY FRANK A. FARRINGTON

What can you expect to know about your net or your gross profits, your stock on hand, your present worth, the depreciation in your stock, or the success of your business unless you inventory at least once every year? And the answer is, "Nothing."

Without an inventory once a year, you cannot

STOCK	COL. A	COL B	COL. C	#	¢	$	¢	$	¢

Suggestion for Simplifying the Work of Stock Taking.

know how much fire insurance you ought to be carrying or how much you ought to receive if your stock is destroyed by fire. Nor can you know whether you are carrying more stock than your business requires. You cannot make any kind of an intelligent statement to your banker when you want to show him that you are entitled to credit. Unless you know how much stock you have and how it compares with last year's, your finances are based on guess-work.

Profits or Losses.

Your business may easily be paying so little that it is not profitable for you to keep your money tied up in it, and yet you may not know this unless you inventory regularly, and there have been plenty of instances where a man was bankrupted by his ignorance, bankrupt before he really found it out.

Suppose you guess at the value of your stock and guess $250 out of the way. You might easily guess that much too high the first of 1917, and as much too low the first of 1918. Even in a small stock a good sized variation might take place unnoticed. It is not uncommon for a dealer to reason that he keeps about the same stock year in and year out and that he is not going to be far wrong in guessing at it as about the same after once taking an inventory. There never was a time when you could follow that method and know anything about what you were doing, and nowadays you simply could not tell anything about it.

How Stock Varies.

If your stock may vary $500 in a year, you may easily have a loss of $500 without realizing it. Of course, theoretically you might have a corresponding gain, but men who take no inventories are rarely the kind of business men to make much of a gain.

More or less depreciation in values of stock takes place where it will not be discovered if you take no inventories. It takes an inventory to find out what is happening in the dark corners and in the back part of shelves and boxes. For the man who has not taken an inventory in 10 years, and I have heard some men boast of that fact, there are going to be some unpleasant surprises when the inventory is taken. Selling out on an inventory basis is often a disappointment to the man who takes his first inventory then.

Stock and Insurance.

How are you planning to get your insurance money in case of a fire? Do you suppose any insurance company will insure a garage stock expecting, in case of fire, to pay for stuff they are not sure was burned? Not in a thousand years! You will have to show the insurance adjuster that you had the stuff and that it was burned. They don't adjust fire insurance on the guess basis. The man who does the adjusting is a different chap from the friendly agent who wrote the insurance and who may be your neighbor. These adjuster fellows are as hard as nails and they purpose to pay insurance according to the loss, not according to the amount of the policy.

And the Bad Bills.

In addition to inventorying your goods, inventory your book accounts too. Otherwise you cannot know how much you ought to write off for poor and uncollectible accounts and you may be surprised to find that all your profits are tied up in bills you cannot collect easily.

If you have failed to take proper inventories, it has not been so much that you don't want to know as that it is too much trouble to find out. Isn't that

Table for Computing Various Parts of a Dozen Where the Dozen Price Is Known.

so? You haven't thought the knowledge worth the work. Well, most of the worth while parts of the day's work are tiresome and sometimes the things most worth while are the hardest and most tiresome. I don't blame any man for dreading to take

Digitized by Google

an inventory. I have dreaded it myself as most men. But that is not a sufficient excuse for neglecting it. You can't expect business to be a joy-ride, anyway. Call inventorying taking medicine, if you wish, but admit the need of the dose and take it and have it over with and get the benefits as soon as you can.

Needs Application.

Inventorying is a job that should never be allowed to drag. Put enough pep into it so it will move right along. Work at it hard while it is under way and get it finished up with the least possible delay. Don't be afraid to give it overtime, if necessary, and pay the help for overtime to get the job done. They will be as glad as you to have it finished.

You may want to put on extra help to take the inventory and you can do this because much of the work, mere counting of parts and stock items, can be done without experience in the business. Don't hold up the work of getting the inventory on paper by waiting to carry out prices and foot up columns as you go along. Get it all down as fast as you can and then you can take your time afterwards to the arithmetic part of it, or you can turn the book over to an accountant and let him figure it up for you.

How to Figure.

It is not worth while to try to get every item exact to a hair's breadth. Variations of a few cents in total sums are not worth the hours of figuring required for them. You can make your inventory right without making it infinitesimally exact.

One mistake that is commonly made in the haste to get the job out of the way is that of "lumping" certain parts of the stock. Estimating the value or even figuring out the value of a certain set of shelves and setting down on the list "Contents of five shelves next door, $256," is not going to be what the insurance company want. They want to know what was on those shelves. Their contents may have been $256 when inventoried, but how do they know they weren't down to $2.50 when the fire occurred? There have been sales and purchases and unless there is some better way of getting at the result than taking the $256 and "guessing" that about as much stock was added to those shelves as was sold, you and the adjuster will disagree right there. The insurance adjuster can be a devil if he likes, so make your plans accordingly. Keep that fire insurance money in your mind all the while you are inventorying the stock.

Honest Values Best.

Don't list junk on the inventory. Boil the list down to the goods you are sure have a value and whose value is not questionable. You cannot gain anything by fooling yourself into the belief that you have more than you really possess, and you are not going to fool anybody else by putting fictitious values on stock.

If you are dishonest with yourself in inventorying, you are just laying pipe for trouble later. Even if you could make yourself think you have a bigger stock than you actually have, what is the advantage? The facts have to come to light sooner or later—either while you are still running the business or after it becomes your estate. If there are losses in stock, take them now instead of allowing them to accumulate to be written off in a bunch.

If you want to make inventorying easier while allowing several to work at it at once, putting it all into one book in the end, work with a loose leaf book, the various workers taking separate leaves and putting them all in the common binder later. This will be more satisfactory and more convenient in the end than having several separate books.

By taking sheets with three columns before the stock item and three sets of dollars and cents columns after it, the same book may be used for three inventories, thus allowing an easy comparison of amounts of stock in separate years and saving writing down the individual items after the first time.

Short Cuts.

Two persons working together will take inventory faster than each working separately. In the former way one counts stock and the other writes down the items and each may work rapidly. The writing is thus done by a man whose paper may be on a proper support, while his hands are not constantly getting dirty and soiling the record. If one man counts and writes, he has to change jobs every item and he will be writing on top of a ladder or under a table and the result will be a mess, perhaps not even legible in parts. A short cut to getting the item cost of an article on which a gross price is given is simply to multiply the gross price by .007. Simple and quick!

Computing Prices.

Here is a plan for making a table for computing the prices of various parts of a dozen where the dozen price is known. In a column right down the left hand side of the page put the various dozen prices to be considered beginning with the cheapest goods, say 25 cents a dozen. The prices might run something like .24, .30, .35, and so on up. Following this column rule 12 columns and number the heads of them consecutively from 1 to 12, beginning at the left. In the first of these columns, under the "1," place opposite the top or lowest price figure the price of 1/12 dozen of an item costing that price per dozen. If that price were 24 cents a dozen, in this column you would write .02. In the second column put the price of 1/6 dozen, or .04, and so on down the line, doing this with each cost price. When this table is once made up, it will save a lot of figuring in carrying out the inventory prices, and it can be kept for reference indefinitely.

A perpetual inventory is carried on in some stores having comparatively few customers, but it is scarcely practical in a garage, though there is a great satisfaction in knowing all the while just where you stand. When a business man can sit down on the first of every month and in a short time know just what his business has done for him in the past 30 days, he is in an enviable position, to say nothing of the fact that he is protecting himself against the danger of his business getting on the rocks before he realizes what is happening.

The inventory is the foundation of all business figures and if it does not pay to take one yearly, then all known business rules are a lie.

The Aktiebolaget Scania-Vabis of Malmo has placed on the market an automobile entirely new in construction. It is a truck with a capacity of four tons and is especially intended for drawing other wagons of different kinds. With this object in view it is equipped with driving and steering gear on all four wheels and can be guided from both ends.

AMONG LOUISIANA GARAGES.

Replacing a Ford Spindle.—Removing Broken Hub Cap.—Bushing Bearings.

BY JAMES F. HOBART, M. E.

The gentle art of cranking a car bids fair to be one of the lost arts ere long if the installation of motor starters continues, as it is bound to do, for

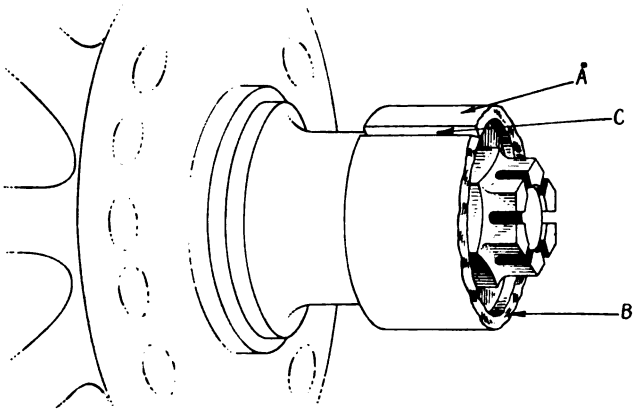

Fig. 1—Illustrating How Cut Was Made to Start Stubborn Hub Cap on Ford.

the motor starter is the only logical way of starting an engine as engines are now constructed.

But the use of motor starters is bound to take away some work from the "Fool Killer" and recently the writer saw an instance thereof. A small motor truck was drawn up at the curb and a young man, evidently left there while the truck driver went into a building, was amusing himself by cranking the engine with his foot. He would set the crank in position for a downward, instead of an upward stroke, then he would balance himself, and give the crank a downward push with one foot.

Several times he started the engine in this way, when just as he was in the midst of a downward stroke, his foot slipped from the crank, which instantly rebounded under the force of compression and the crank struck the man a blow upon the shin bone which very suddenly and completely cured him of all desire for foot cranking of engines.

Although the foolish young man was not badly hurt, he had a chance to see what might have happened had there been a kick-back. A broken leg would have been the least he could hoped to escape with had the engine fired and the crank been forced backward while he was standing on it. And it is to be hoped that the young man will remember the lesson.

Replacing Ford Spindle.

A physician recently drove his Ford car up to a garage in New Orleans and indicating the left forward front wheel from which the hub-cap was missing and the spindle seemed to be running directly upon the inside of the wheel hub, said, "How long will it take to fix?"

"I'll have it ready for you in half an hour, doctor," was the reply.

"Oh, bother!" said the M. D. as he seized his medicine case and vanished down the street almost at a dog-trot.

"Got your work cut out for the next half hour, haven't you?" the writer inquired of the garage owner.

"Oh, it won't take long to put some new ball bearings into that hub," was the reply. But it did.

Removing Broken Hub Cap.

The first thing was to remove the broken hub cap, which proved a task. The garageman tried to screw off the remainder of the cap shown at A, Fig. 1, with a Stillson wrench and failed. Then he hammered down the projecting edge B, which overhung the hub about one-eighth of an inch. He hammered away on this, trying to shape it so the stock wrench sent out with Ford cars for hub caps and spindles would catch the cap remains and screw them off. This also failed.

Then with a very sharp three-cornered cold chisel, a narrow channel was cut right across the piece of hub cap as shown at C. The cut was made right down to the bottom of the threads, cutting into the hub the thickness of the fine threads where the cap screwed on.

A corner of the old cap was raised with pliers and twisted up so a good hold could be got on the fragment with the pliers, after which the thin metal was peeled off. The repair man would never have been able to start it off by unscrewing the old cap with any means at his command. Heating with a torch might have started the cap, but that would have required a lot of time. The fine chisel cut across the threads of the hub did no harm. It was covered entirely by the new cap, and did not weaken the hub appreciably.

It was now possible to unscrew the spindle nut, after the cotter pin had been pulled out, and the stock wrench could now be used to advantage, the wheel being removed in short order. It was found that the doctor had driven the car so long after the balls came out, that the old ball race had cut its way nearly half way through the spindle and from the bottom side.

"These doctors don't give a darn," said the garageman. "They abuse a car worse than any other class of drivers. All they care is that the wheels will go 'round and that they can get there. Doctors ought to buy stouter cars than the Fords. The Ford is all right if you take care of it once in a

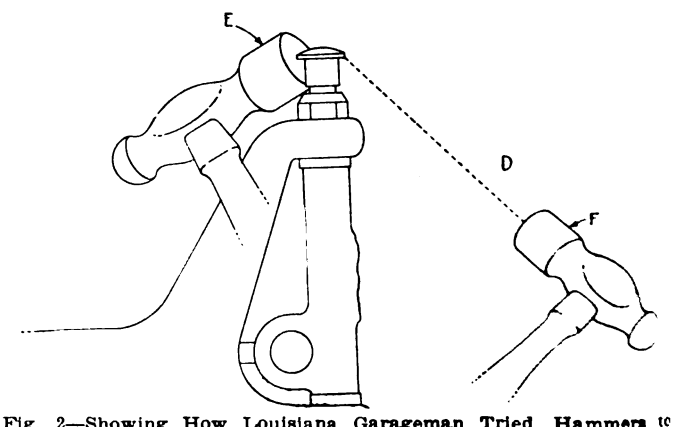

Fig. 2—Showing How Louisiana Garageman Tried Hammers to Displace Knuckle Pin.

while, but a doctor won't, and that's all there is about it."

"Hey, Bill," said the garageman, "step around to White's and get a new front spindle, left side. Get the whole thing except the starting lever!"

"Don't you carry any Ford parts at all," the writer asked of the garageman.

Digitized by Google

"No," he replied. "It don't pay for me to bother with ordering, carrying and keeping account of the parts when I can go around the corner at any time and in 10 minutes get any Ford part I need."

"But you are 10 minutes out, twenty times a

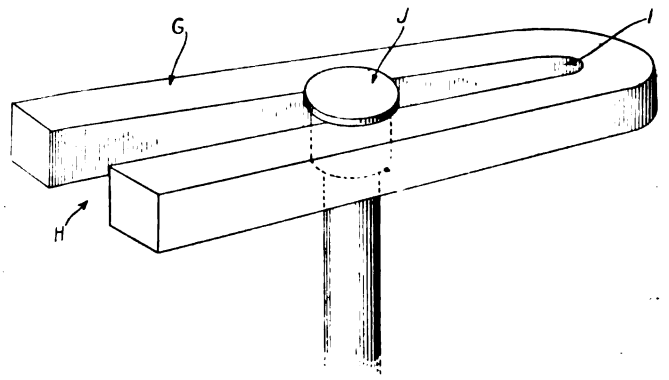

Fig. 3—Tool for Driving Out Ford Knuckle Pin or Spindle Bolt.

day, aren't you, going after parts as often as you have to?"

"Out nuthin'! What do you think? That I'm in the automobile repair business for my health or to get a little exercise? What does that 10 minutes amount to? Aren't I working on that car, or one of my men is, and charging up our time too? Well, I guess yes, and charging every minute of it, too. So, who cares if we go to the supply store 10 times a day or twenty?"

The "wash-can" was fetched and the inside of the hub of the wheel well washed out, the old spindle also well cleaned and the entire knuckle given a liberal splashing with coal oil.

"Yes," said the garageman, "we use coal oil entirely for cleaning. Haven't used gasoline for a couple of years. The coal oil costs only about one-half as much as gasoline and it cleans just about as well. And another thing, the coal oil isn't all the time evaporating when it happens to be left uncovered, and there is no danger of fire when kerosene is used for cleaning metal parts. Why, a man used to lose enough time uncovering and covering gasoline cleaning cans to pay for all the coal oil we use for that purpose. The change to coal oil for cleaning has been a mighty good one, viewed from all sides!"

Pulling Out Knuckle Pins.

Removing a knuckle pin is a mean job at best. To begin with, the pin is fitted very closely and the dirt, grease, rust or paint which may have found lodgment on the pin, between top and lower knuckles, does not help matters when a pin has to be removed. The car in question had its wheel jacked up but there was little room under the knuckle for backing or driving out the pin. The garageman tried the double hammer business as shown at Fig. 2. He held one hammer, a fairly heavy one, against and under the head of the pin as shown at E. Then with a lighter hammer F he tried to strike upward against the under side of head of pin, as shown at D, so as to drive the pin up and out, the heavy hammer E acting to absorb the sidewise effect of the blows from hammer F, leaving the upward force thereof to draw the pin from its place.

Somehow this plan didn't seem to work very well and the garageman, after thinking a bit, took a 12-inch piece of 5/8-inch key steel G as shown at Fig. 3, and bent it in the middle as shown at I, leaving it a little less there than the diameter of the pin. At H the opening was left greater than the pin diameter so that when the tool was placed against the pin J the tool could be driven along until it pinched against pin J and held it tightly. Then it was easy to drive the pin out by striking fair blows under one end of G, the other end of the tool being held securely with tongs or with a monkey wrench screwed tightly against the tool G.

Before making this tool the garageman tried driving the pin while holding it in a new, adjustable end wrench, but quickly abandoned the plan, saying, "That wrench cost me $2.50 and I ain't going to spoil it a-driving out knuckle pins!"

Reaming a Spindle.

It is necessary to ream a hole in a new spindle for the knuckle pin. Sometimes it is necessary to put in a pin which is larger than the old one on account of the knuckles having become worn a bit, then reaming is necessary. All extra knuckles are sent out with the pin hole small and are reamed to size.

A stock reamer has its flutes turned in the direction opposite to which the reamer is rotated, and sometimes the reamer does not take hold readily, especially where the hole in the spindle is a bit small. In a case like this it is well to give a couple of turns with a twist drill of just a little less diameter than the reamer. This treatment will make the reamer "bite" quickly and easily and the workman can save a bit of time by thus starting the reamer.

While the spindle was being reamed the reamer "balked" twice. It stopped cutting all of its own accord after it had been well started into the hole. The workman removed the reamer and found that the chips had "bridged" the hole, notably at the bottom of the "chamber" in the spindle which is made with a small hole at either end and a cored chamber in the middle, where no reaming has to be done. This form of construction saved metal, time and reamers but the workman has to be careful when reaming and not let the chips bridge

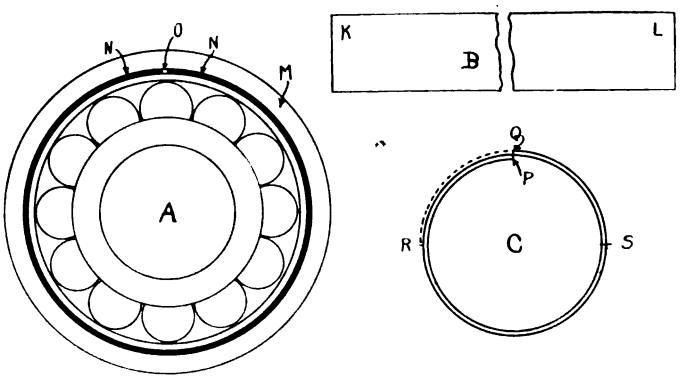

Fig. 4—Ford Repair Hints; A, Bushing a Bearing; B, Bushing Made of Sheet Brass; C, Making the Bushing.

across at the bottom of the chamber, ahead of the reamer.

Next time this workman reams a Ford spindle he will take a bit of wire, No. 16 or 14, and occasionally push the wire up from the bottom of the spindle to dislodge the chips which otherwise might

Digitized by Google

lodge there and bridge across so thoroughly that the reamer could not be pushed through them.

A reamer twisted in the direction opposite to which it is turned for cutting will never be drawn into the work too fast. On the other hand, especially after the reamer gets a bit dull, it may be necessary to force the reamer to its work a bit. This was what the workman thought had happened when the reamer stopped cutting in the middle of the hole. Accordingly the man pushed a bit harder on the reamer and kept pushing, with no results, thereby wasting several minutes of time.

Assembling New Spindle.

The pin, after all its hammering during the backing-out, was found to be in good shape. It was cleaned thoroughly in coal oil. The workman next draw filed it a bit, holding the pin in one hand, while he applied the file with the other. He did not place the pin in a vise for the very light filing, which was done merely to remove rust and grease, not to remove any of the metal. Draw filing in the vise would nave resulted in removing metal.

The cotter holes were next well cleaned out and the workman noted particularly the direction of any cotter hole before he put the nut in place over that hole so that he knew just where to look for the hole when the nut was nearly screwed home. In this way the workman saved a good many minutes which otherwise would have been wasted in hunting for the cotter hole, as the nut was tightened.

A liberal dose of oil was given to the spindle knuckle pin before it was driven home, and the workman gave a good bit of attention to adjusting the castle nut at the lower end of the pin. He first tightened that nut until the spindle was locked in the knuckle. Then he took a small machine hammer and struck a few smart blows on the top or head end of the pin. This treatment seemed to settle the parts together in an extra close manner and the knuckle, which was tight before the hammering, could be moved easily with the hand after the blows had been struck.

"I always like to adjust knuckle pins in this manner," said the workman. "It keeps them from getting loose for a long time after such an adjustment. In fact, pins thus adjusted usually never need tightening, as the parts are set together so closely that the small amount of dirt and rust which gets into the joint prevents them from even becoming loose enough to require the castle nut to be set up another segment."

Bushing Ball Bearings.

When the larger ball bearing was placed inside of the wheel-hub it was very quickly discovered that the cage or race was too small, that the bearing would lie loose inside of the hub. "The hub has been worn and perhaps stretched," said the garageman, "because of the old cage running loose in the hub, for nobody knows how long hammering itself to pieces and expanding the hub a little at the same time.

"But I'll fix that," he continued, and he went to the storeroom and brought back some very thin sheet brass, stencil brass, he called it, almost as thin as paper. A strip was cut about ¾-inch wide and just long enough to reach around the larger ball bearing cage. The strip is shown at K, L, Fig. 4, B.

The cage was then started into its seat in the hub with the strip of brass wrapped around. A little juggling was necessary in order to make the strip of brass drive in evenly with the cage, as the garageman did not want one part of the strip to go in while another portion stayed out.

But after a few false starts the cage and the bushing were driven to the bottom of the hub cavity, evenly and snugly, as shown at Fig. 4, A, in which M M is the portion of the hub which contains the cage cavity. O is the bearing cage and N N is one edge of the strip, which projects quite evenly past the edge of the ball bearing cage. With a sharp knife the workman marked heavily into the brass bushing, closely along the edge of the cage O and against the surface of hub M M. One end of the bushing was caught at N with pliers and rolled up a bit until it commenced to tear along the knife mark. The projecting strip was next quickly pulled entirely off, leaving the bushing with a clean edge, flush with and all around the cage O. The cage was driven pretty solidly into place by means of a bit of soft steel which was moved around from place to place and blows struck against the steel until the cage was fairly into place.

A Variable Bushing.

When the small cage, the one at the front side of the wheel, was tried in its place, that one, too, was found to be very loose. "More stretch," said the garageman, and he proceeded to apply a shorter strip of the thin brass which, by the way, if found to be hard when purchased, can be heated and plunged into water while almost red hot, thereby removing all springiness from the metal and making the brass very soft indeed.

Finding the bushing did not fix the cage firmly, the workman looked for a thicker piece of brass, but failed to find any in stock. He next cut a strip which, when rolled up to the diameter of the smaller ball cage, as shown at P Q, Fig. 6, A C, would not tighten the cage. The workman simply cut a longer strip which lapped as per the dotted lines, from Q to R. The bushing was inserted in this manner and found to make the cage a bit too tight, whereupon the bushing was shortened a little and until it tightened the cage to suit the workman.

"Don't that method of bushing throw the cage out of center?" the writer asked the garageman?

"Well, I suppose that it does a very little, but if one stops to consider how mighty thin this brass is, and that the cage may not be quite round or the inside of the hub exactly true, then it will be pretty hard to figure whether the cage is out of true one-thousandth of an inch or two one-thousandths. And even with this amount of 'wobble' if you or anybody else can detect it in the running of a wheel thus bushed, then let me know and I will hunt up some other way of bushing ball bearing cages when they need it, which is almost always the case when a new bearing is put into an old hub.

"We work this thing the other way, sometimes," he said. "When the bushing proves to be just a little too thick and the cage will not drive home without danger of springing, then I cut off a bit of the bushing from Q back toward S, as far as may be required to make the fit just tight enough. This throws the cage 'out' a bit, too, I reckon, but I never have been able to find a man who can prove that the error is enough to do any harm in the running of the wheel thus bushed! Can you?"

Defining the Various Standard Electrical Measuring Units

Their Names, Derivation, Quantity, Quality, Etc., Explained By Simple Chart Including Various Methods of Wiring

BY AUGUSTUS A. WEST

Electricity is a form of energy reputed to have derived its name from the Greek name for amber, elektron, because some 2,000 years ago it was found that amber, when rubbed with cloth, had a property of attracting and repelling objects of light weight. Magnetism is the residual property of electricity in steel. Magnetism and electricity are similar. There are various methods of producing electricity, such as by chemical or mechanical means, but it is similar. Where it comes from or goes to we do not know, but it has a host of useful applications. A more recent theory defines the primal source of everything as electrons which are a smaller unit than elements.

A number of electrical measuring units have been standardised, those in common use being the volt, ampere, ohm and watt. The names of the units have been given in honor of scientists as Count A. Volta, Italian electrician, 1745-1827; A. M. Ampere, French physicist, 1775-1836; C. A. DeCoulomb, French scientist, 1736-1806; M. Ohm, German physicist, 1787-1854; James Watt, Scotch inventor, 1736-1819; M. Faraday, English physicist, 1791-1867; J. P. Joule, English physicist, 1818-1889, and Joseph Henry, American physicist, 1798-1878.

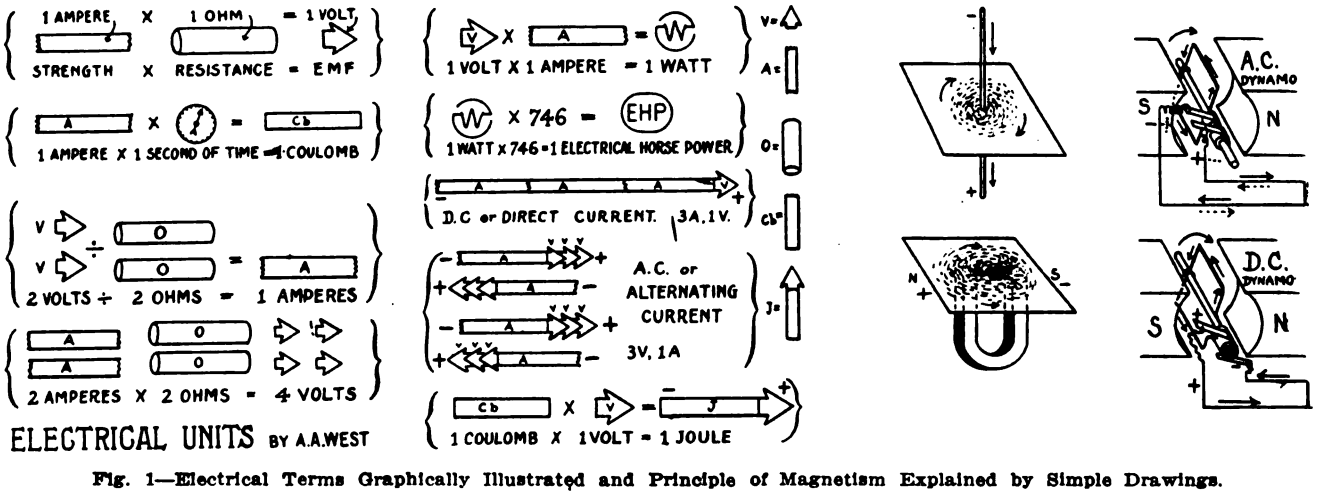

Fig. 1—Electrical Terms Graphically Illustrated and Principle of Magnetism Explained by Simple Drawings.

Electrical Units.

The volt is the unit of pressure, the electromotive force, E. M. F. It is a current of one ampere through a resistance of one ohm. The quantity of current is the coulomb. It is a current of the strength of one ampere for one second of time; thus three amperes of current flowing one second would be three coulombs. One ampere of current is one coulomb flowing in one second. It is the unit of strength. An ohm is the unit of resistance, as 9.3 feet of No. 30 (B. S.) copper wire has a resistance of one ohm. The watt is the unit of power. It is a current having a pressure of one volt and a strength of one ampere and is equal to 1-746th of a horse power. One electrical horse power, E. H. P., is 746 watts. A kilowatt is 1,000 watts. The farad is the term for the capacity of an electrical conductor. A surface that will retain the quantity of one coulomb at a pressure of one volt is one farad. A micro-farad is one millionth of a farad, which is the unit of electrical capacity. The henry is the unit of self-inductance. An inductance of one henry existing in a circuit changing at the rate of one ampere per second induces a pressure of one volt. The millihenry, or 1/1000th henry, is the accepted working unit. The joule is the unit of electrical energy, equal to 10.7 absolute units or ergs or the amount of work done when one coulomb moves under a pressure of one volt, also called the volt-coulomb. One joule per second is equal to one watt. Four and two tenths joules equal one small calorie.

The electrical chart shown at Fig. 2 will be convenient for reference, as it gives the names of the units, their derivation, quality, such as resistance, quantity, etc. The name of the measuring instrument is also indicated. Fig. 1 shows the volt as an arrow head, the ampere as part of the arrow shaft with broken ends, the coulomb as an exact section of the arrow's shaft as it is the flow per second of time. The ohm may be compared to a tube through which the arrow must pass, and a joule as a complete arrow. In a direct current flow the arrow goes from negative, or —, to positive, or +. Alternating currents flow first one way and then in the opposite direction.

The drawing at Fig. 2 shows three batteries in series. These are two volts, four amperes per battery. When thus wired we obtain six volts or pressure and four amperes. In parallel the same cells will provide two volts and twelve amperes. In series parallel, four volts and eight amperes.

Series and shunt motors are shown, S standing for switch and R for rheostat or resistance.

When the electro magnet shown is wrapped with

Digitized by Google

an additional wire coil an induced current is obtained. The condenser also works by induction.

Direct current flows in one direction as from a positive to a negative pole. The principle of a dynamo and motor is similar. The dynamo is power driven and generates a current while the motor requires current to operate. The motors used on automobiles are direct current machines.

All dynamos would be alternating if collector rings were used instead of commutators which directs the flow in one direction. The first dynamo had permanent magnets and pole pieces, like the ignition magneto. The present day dynamo and motor have a round external iron ring with internal fields and center pointing poles. The modern motors used on motor cars are generally series wound. When a wire is carried across between two lines it is called a shunt. When two shunts are used the construction is called in multiple or parallel.

The electro magnet is a bar of soft iron wrapped with a number of coils of insulated wire. By insulating the wire the current proper is confined to the wire proper, but induced currents are made possible because there surrounds all metals carrying an electrical current a halo or field of force. Visible effects of this electrical radiation may be seen by piercing a card with a wire, sprinkling iron filings on the card. When a current is sent through the wire the filings will form in circles around the wire. Magnetism's relation to electricity is shown in like manner by placing iron filings on a paper held over the poles of a magnet. A wire coiled like a spring shows polarity the same as a magnet.

Primary batteries provide current through chemical action. The secondary or storage battery stores the current sent into it and delivers it afterward. The so-called dry battery is a semi-moist primary battery and when run down can be partially revived by a salt or sal ammoniac solution.

ELECTRICAL TABLE BY A.A.WEST

UNIT OF		NAME	DERIVATION		INSTRUMENT
E.M.F. or Electro Motive Force	V.	...VOLT...	Ampere X Ohm...	AXO.	Voltmeter...

Secures Restraining Order.

The American Bureau of Engineering, Inc., Chicago, Ill., maker of Ambu, the electric trouble shooter, through their attorneys appeared before Judge Carpenter in the United States Circuit Court and secured a restraining order prohibiting the sale of the so-called Official Wiring Guide as published by the International Motor Institute.

The contention of the American Bureau of Engineering, Inc., was that the wiring diagrams published and offered for sale by the defendants are deliberate copies of the copyrighted, authentic wiring diagrams of the American Bureau of Engineering, Inc. As part of the comprehensive information comprising Ambu service, the wiring diagrams, distinguished by the circular copyright imprint of Ambu, are looked upon as standard and authoritative and the garage men should therefore be warned of this action.

Prevents Fuel Evaporation.

Experts estimate that for every gallon of gasoline placed in the hands of the ultimate user a quart is lost through evaporation; that is, the highly volatile part. This part that is lost could be mixed with lower oils in the proportion of one to three, thus doubling the commercial gasoline supply.

To eliminate this evaporation in storage, Claude S. Briggs has formed the Hydraulic Oil Systems Corp., Detroit. The system is the invention of Frederick G. Farr, and its principle consists of the storing of oil, whether gasoline, lubricating or crude, over water in a sealed tank, thus keeping it from the air and preventing evaporation. The oil is taken from the top of the tank, avoiding the possibility of sediment, etc., being present in the piping. It is also claimed that the water pressure necessary to keep the tank full to the top also provides a very forceful "head" of fuel, making delivery rapid and eliminating hand pumping. Systems are to be produced for the retail trade, etc.

Australia Needs Bodies.

Efforts are being made to obtain permission to import bodies for motor cars into Australia to supply the demand until such time as factories can be equipped to manufacture them in sufficient quantities. It is pointed out by those interested in the trade that at least 10,000 bodies will be required within the next year, and that it is extremely doubtful whether one-fifth that number can be manufactured in Australia with the factories' present equipment. The normal output of motor car bodies in Australia is estimated at 1,100 a year.

To Make Tires in Cuba.

A firm to manufacture automobile tires and all kinds of rubber goods under the name of the "Cuban Tire and Rubber Co." has been established in Havana, Cuba. It is stated that it intends also to put in rubber-restoring machinery, thereby using old rubber.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2315 **Desires Much Information.**

From W. M. Mitchell, Illinois.—Please answer the following questions dealing with the Ford engine: 1—How many thousandths in inches clearance on the top and skirt of the piston is correct to fit the cylinder? 2—How many thousandths clearance should rings have in piston grooves to allow for good expansion? 3—How many thousandths clearance should rings have between points or ends when fitted to the cylinder and to allow for expansion under heat? 4—Is it not imperative that wrist pins should work in bronze bushings fitted to the piston owing to the tremendous heat caused by burning of the gas? 5—Isn't the wear on piston pins when fitted to a piston without a bushing very severe? 6—Is it not true that the wristpin should be fitted to bronze bushings in piston to make a good mechanic's job? 7—Give the distance of movement in fraction of an inch of movement of wrist pin in rotating during one complete revolution of crankshaft. 8—How many thousandths inches lateral movement should connecting rod have on crankshaft? 9—Should wristpin have a snug fit in bronze bushing? 10—Would not a loose fit on wristpin and connecting rod, that is, laterally, produce a knock when engine is running, especially when weight of car runs on engine after closing the throttle? 11—In operating the Ford engine on the battery for several days and without using the magneto, would not the magnetism generated by the magneto burn up the magneto coils; that is, burn the insulation around the coils, causing a short in the coils? 12—Is it not a fact that when the engine is run on the batteries for any great length of time the magneto should be grounded so in case of a short in the magneto, which had been dislodged and the magneto begins to generate again, it could not burn up the magneto coils? Am I correct? 13—When magneto is set 3/16-inch from coil spools is not the magnetic lines of force weakened to such an extent that the output of the magneto is low?

Reply.—The Ford pistons are fitted (factory) with a clearance of from .003 to .004-inch; that is, the clearance at the wristpin. 2—The rings have a side clearance of from .001 to .002-inch in the ring groove. 3—The top ring is usually fitted with a gap from .004 to .008-inch between the ends. The middle ring has a gap of from .008 to .012-inch and the lower ring from .012 to .015-inch. 4—Bronze is generally utilized for those types of pistons having wristpins oscillating in the piston bosses as the design mentioned. 5—The amount of wear would depend upon the materials utilized. Where the wristpin is fixed in the piston bosses the wear occurs both on the wristpin and the small end of the connecting rod. 6—No. See answers to questions 4 and 5. 7—The wristpin moves .21-inch during one complete revolution of the crankshaft. 8—The bearings of rods are fitted, not installed, according to dimensions. 9—Yes, fairly so. 10—Yes, loose rods, etc., are the source of knocks. 11—Operating the engine on batteries for several days will not injure the flywheel magneto. In fact, one could run the engine on batteries for months or even years without injuring the magneto in any way, providing it was not acted upon by some outside force, such as attaching the battery to the magneto terminal on the transmission cover or due to a short circuit. 12—No, you are wrong. 13—The proper gap between the magneto clamps and the coil spools is 1/32-inch and that distance should be uniform all the way around. If the distance was 3/16 the output of the magneto would be decreased on account of the reduction in the magnetic lines of force.

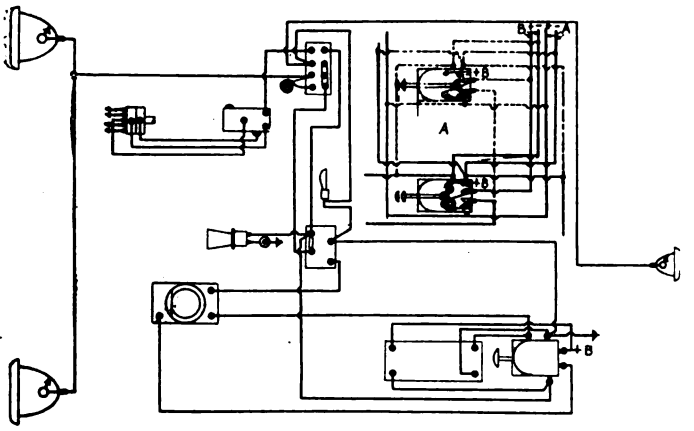
2316 **Dealing With Rheostats.**

From T. E. Joy, Maine.—I have a 30-volt 12-ampere generator which I use to light my garage. Also an ammeter and a voltmeter. Then I have a type 9G rheostat made by the St. Louis Electrical Works. This has an ammeter and is supposed to charge from one to four batteries at the same time. If I keep the generator at 30 volts will this auxiliary rheostat cut the voltage down so I can charge one six-volt battery without damaging it?

Reply.—It is possible to charge one six-volt storage battery from the generator with the 9G rheostat and still maintain 30 volts on the generator, but you should not charge the battery at more than a six-ampere rate. A higher charging rate or current than six amperes with 30 volts will damage the rheostat.

2317 **Why Battery Fails to Charge.**

From E. Steding, New York.—I have a 1916 Elcar, made by the Elkhart Carriage & Motor Co., and equipped with Apelco system. Have been having trouble with the motor starter. The battery, after charging from outside source, will start the engine via starter, but in a very short time the starter will not operate for the reason, the local battery man tells me, is that one side of the battery is not charged by the generator, and if I want to use the starter at all, must charge the battery independent and at least once a week. I may say in connection that the three cells, towards the universal joint (on the inside of the car) refuse to be charged, and the battery man wishes me to tell you that the battery is all right and that the polarity is O. K.



Now where can the trouble be? We suspected a short circuit, as the cables flashed when connected with binding posts, but we cured that, as the nuts on the binding post were loose, and now the battery man claims that the trouble is very likely in the switch.

I may say that the generator seems to work all right. The indicating switch shows on as soon as

Digitized by Google

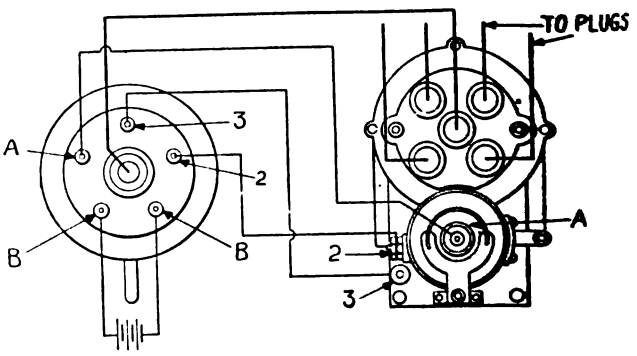
the car is started, but when the current is tested with an ammeter the outside cells show they are being charged but the inside show they are not.

Looking over the wires there does not appear to be any short circuit leading from the generator to

Illustrating Wiring Plan of Apelco System and Components Responsible for Failure of Dynamo to Charge Battery.

the switch, nor any other wire that I can see, so probably it may be in the switch, as he claims; the starting switch regulates the charging of the battery. He admits it is guesswork on his part.

Reply.—According to your description it appears that the jumper inside the switch is burned out. This jumper connects from the upper left-hand post to the postive +B on the starting switch. See accompanying large drawing B. The paralleling finger contacts may not close. These should close when the switch is in the running or upper position and open when in the starting or down position. This strip and contact are shown in the smaller drawing, the inset, marked A. Care should be taken to disconnect the battery leads A+ and B+ before working on the switch to prevent short circuits, also connect carefully and according to the large wiring plan. In case the wrong wires are connected the strip above referred to is likely to burn out or the switch be injured. When the strip or paralleling contacts are open the battery will be only half charged; that is, one half will get all of the charging current from the generator which makes for poor starting and may injure the system.



2318 Starter Gear Won't Mesh.

From Campbell & Co., Michigan.—We have a model 81, 1915 Overland equipped with an Auto-Lite starter. We, in common with several other owners here, have trouble with our starter spinning against the teeth on the flywheel and not meshing with the flywheel teeth but gradually wearing them out. Our first flywheel teeth were torn out in this way until eventually there were no teeth in two spots on the flywheel. This necessitated the purchase of a new flywheel, and the present wheel is going the same way. Letters from the company state that the starter was not properly placed, although they placed the first one, and we were careful to have the starter properly placed after putting on the new flywheel. The fact is that the four bolts that attach the starter to the frame plate of the car cannot be varied if the bolts are drawn up tight (and they are) for the reason that the bolt holes are a perfect fit, in fact, they have to be tapped through with a hammer they fit so tight. So the starter placement cannot be varied. It is just where the makers intended it to go. Can you tell of any adjustment that can be made so that the teeth of the starter pinion will always mesh with the flywheel teeth when the heel lever is compressed? The trouble of course is that the flywheel does not always stop just right, but the pinion gear ought to find the teeth in the flywheel, and in perhaps 75 per cent. of the times it does. The balance of the time it does not, but will rip and tear against the edge of the flywheel teeth instead of gaining entrance so eventually the teeth are worn away, not from their surfaces but from their rear ends. When meshed the teeth of both seem to be just a nice fit. Not too tight, not too much play. Can you help us as you have helped many others?

Reply.—Your trouble is due to the fact that the switch is making contact before the starter pinion is properly engaged with the flywheel. It is explained that in pushing the starter button the starter pinion is pushed into mesh with the flywheel, and at the same time the switch makes contact, causing the motor to revolve. To correct this trouble it will be necessary to remove the switch from the starting motor and readjust the blade so that the contact will not take place until the starter pinion is completely engaged with the flywheel.

2319 Has Ignition Puzzle.

From Edward J. Hinchcliffe, New Jersey.—I have a 1910 Mercer with Splitdorf dual ignition system, round type of coil. Starting on the batteries I could always start on the second pull of the crank and on the coldest days. But about six weeks ago the engine would not start on batteries although they tested to 20 amperes. Looked at switch but could not see anything wrong. Put in new wires, thinking a short circuit might exist. Nothing doing. Did everything I could think of. I tried cranking her over a couple of times, then pushed the starting button, and presto, she started and ran as long as I kept pushing the button. The engine did not run steady as I could not push the button regularly enough. I now start by turning the engine over a couple of times, then push the button and when she starts throw over on to the magneto. The engine runs all right on the magneto, but will not start on the batteries except as described. It strikes me that

Showing the Wiring Plan of a Splitdorf Dual Type of Magneto and TSF Transformer Coil.

the coil must be all right as the engine would not run on the magneto were it not. Please advise as to trouble and the remedy.

Reply.—It is very probable that the coil and magneto are not properly wired. The accompanying diagram shows the wiring plan with the TSF trans-

Digitized by Google

former. If wiring is correct and the trouble continues, it is advisable to drive to the nearest service station and have the switch mechanism inspected.

2320 **Installing Ammeter.**

From R. E. Norris, Arkansas.—Please give a diagram in your next issue showing how to connect an ammeter to show charge and discharge on a model C-25, 1915 Buick. Do not want to show starter discharge if it can be avoided and am at a loss to know how to connect so as to cut out the starting discharge. Also advise how to increase the output of the Delco generator and also the Auto-Lite generator as used on the later model Overlands.

In connection with the Overland 90 and 85-6, we have had trouble with automatic cut-out sometimes failing to close when the engine is running at a sufficient speed to generate. At times it closes and opens rapidly when engine is running at charging rate, causing batteries to deteriorate. Fail to locate any trouble with the cut-out or any other unit in the system. On the 85-6 the ammeter will not show charge until engine is run a few minutes, then shows good charging rate, but later this rate decreases until at 20 to 25 m. p. h. the current indicated is not over 10 or 12 amperes when at that speed it should show 14 or more amperes. Brushes on this generator have been dressed down, also the commutator, after this trouble appeared, with visible results.

Reply.—An ammeter can be connected in the charging circuit of the 1915 model C-25 Buick that will show both the charging and discharging rate of the storage battery by disconnecting the wire from the No. 1 terminal on the back of the combination lighting and ignition switch, and connecting this wire to the negative — terminal on the meter, and from the positive + terminal on the back of the meter, connect a similar wire to the No. 1 terminal of the switch. An ammeter connected in this manner will not show discharge from the storage battery during the cranking operation.

The charging rate of the generator on this car cannot be changed. The charging rate is regulated by a reverse series winding in the field coil, and the number of turns in the field coil are constant and the only way the charging rate could be varied at all would be to either remove some of these turns of wire or to increase the number of turns, and to do this is not practical for the average equipped garage. The maker of the Delco system strongly disapproves of any attempt to change the charging rate.

Relative to the trouble experienced with the system on the Overland cars. This is a pretty hard condition to diagnose. It appears that the trouble is in the armature winding and due to an intermittent short. We would suggest that you return the instrument to the factory with a letter of instructions at the time of the shipment, advising the maker as to the nature of the trouble.

2321 **Has Ground in Secondary.**

From H. B. Hazen, Rhode Island.—I am having trouble with my Ford running with a good deal of noise. When the spark is advanced it sounds worse and as though all the cylinders were trying to fire at once and hold the engine back. The spark is just where it has been and the engine runs quiet and has lots of power. The engine seems to squeak and rattle all over. I find the cylinder head charged all over or at least I receive a shock by simply laying my fingers on it. The engine was overhauled by an expert in July. Have tested the intake manifold and cylinder head and both are tight. Have new spark plugs. Starts very easy on a cold morning but does not run flexible. Have a J. & B. timer, nearly new. It looks O. K. but does not look bright where roller makes contact. I have about concluded there is a short circuit or that the timer is not right. No carbon and valves are O. K.

Reply.—The fact that your cylinder bloc is charged indicates a short or ground in the secondary circuit, not in the primary, as you would not receive a shock from the primary current in this ignition system. Look for a faulty secondary wire or connection. Make a systematic search, tracing each wire and connection from source to plug. Inspect and test each spark plug. It is doubtful if the timer be at fault.

2322 **Says Polarity Changes.**

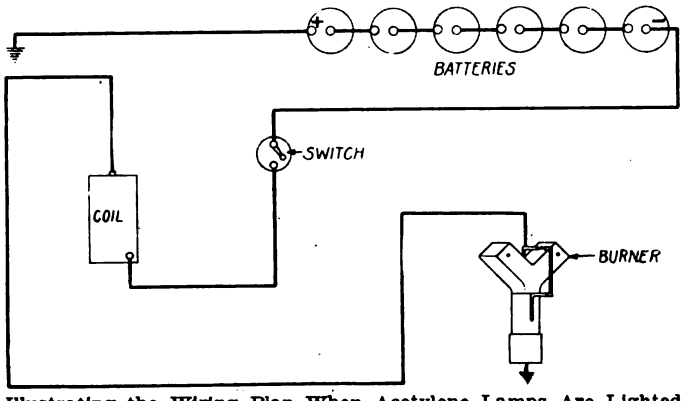
From C. H. Epps, New York.—I had a case of electrical trouble come to me the other day and would like to know a little something about it. The car was a 1918 Oakland, a light six, and they had let the battery go dry. There was not enough juice in it to start the engine with the hand crank. I got another battery and installed it to start the engine. When I got it started the generator charged the wrong way so I reversed the wires on the battery. The battery then charged all right but when the car was driven at night the lights and ignition took so much current or something that when we tried to start the car the next morning the battery was about exhausted. The generator had changed so it charged the wrong way, as it did the first time. Every time the battery did this the generator changed polarity. It is a Delco two-unit system. What makes the generator change polarity?

Reply.—The only way the polarity of the generator on this car can be changed is to reverse the connections of the storage battery, and should the negative — side of the battery be connected through the switch to the generator when the ignition button is pulled out the current would then travel through the frame of the car and the generator winding in the opposite direction which would change the polarity of the pole pieces of the generator which, of course, would reverse the direction of the current going from the generator.

If the ammeter on this car shows a reverse reading, it is undoubtedly caused by either the storage battery connection having been reversed or the leads on the back of the meter have been changed. The characteristics of the shunt wound generator are such that when a storage battery is connected to the two main leads and the circuit is closed, the generator will charge the battery in the right direction when driven.

2323 **Retempering Ball Bearings.**

From L. F. Hardestry, West Virginia.—Will you please inform me where I can get ball bearings retempered that have been through a fire? The bearings are not injured, only the temper is gone.



Reply.—It is best to send the bearings to the

Digitized by Google

maker as the factory is best equipped to temper the balls, races, etc., and to make any needed repairs.

2324 **Lighting Gas With Spark.**

From E. C. Clark, New Hampshire.—Please advise me how to run wires from a battery through a coil to headlights equipped with acetylene burners. I want to obtain a spark for igniting the gas. Can it

Illustrating the Wiring Plan When Acetylene Lamps Are Lighted by Spark Coil Current.

be done with the coil on the Ford car or would it be necessary to have a separate coil? I have a Remy coil, a four-cylinder unit. Could that be used and how? Any information you can give me on this subject will be appreciated.

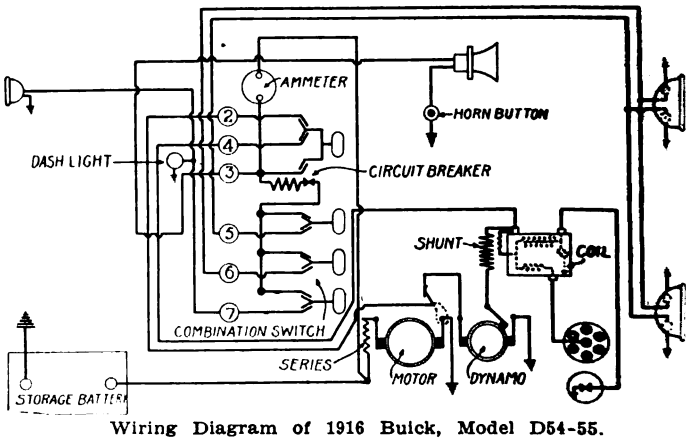
Reply.—An accompanying illustration shows the principle involved in utilizing a spark from an induction coil for igniting the acetylene. The cells are connected in series and one side is grounded. The other wire leads to the primary of the coil. Incorporated in the primary circuit is a switch, but a type of push button would be preferable. The secondary circuit is simple. The high-tension current is conveyed to an insulated member on the tip of the burner which is grounded. The current jumping the gap, and much in the same manner as with the spark plug, ignites the gas.

You will need some form of a control valve for regulating the supply of acetylene from the tank, and it is advisable to use an automatic reducing valve on the tank proper. Such a valve will keep the pressure to about two ounces at all times. The Prest-O-Lite Company, Indianapolis, marketed a complete outfit several years ago and it may be possible to secure the material you require by writing the company. Insofar as the coil is concerned, any type of vibrating coil is adaptable. The wiring is simple, the principle involved being similar to the wiring of the ignition system of the internal combustion engine.

2325 **Acetylene for Starting.**

From Hart E. Buell, Connecticut.—Please state how to start a Ford car in cold weather when there is no hot water available for the carburetor. How would you connect a branch pipe from a Prest-O-Lite tank with the carburetor so as to make starting easy? Would there be any danger of blowing up the car?

Reply.—Increase the fuel supply by regulating the needle valve which is adjusted from the dash. Prime the cylinders with gasoline or a mixture of sulphuric ether and gasoline. The acetylene gas can be introduced into the intake manifold above the carburetor. There is no danger if properly used. If a tank is employed it will be best to make use of a reducing valve. These valves are made by the Prest-O-Lite Company, Indianapolis, Ind.



2326 **Will Ruin Magneto.**

From Oscar Rodenbach & Son, Pennsylvania.—Please supply answers to the following: Would it be harmful to connect a storage battery with the Dixie true high-tension magneto so as to use it for starting purposes, the current to go through the magneto only when the starting switch is engaged? Please give us a diagram of the wiring, also state whether it would harm the magneto. Mention at which part of the coil the current should go through.

Reply.—If you attempt to connect dry cells or a storage battery with the magneto as mentioned, you will seriously injure it. A true high-tension magneto is not constructed to be used as you suggest. It has two windings, a primary and a secondary, the last named transforming the low-tension current into a high. Magnetos are constructed, however, wherein use is made of dry cells or a storage battery as described, but these instruments are known as the low-tension type; that is, the armature has but one winding, a coarse or primary winding. The current generated and that supplied by the batteries is transformed or stepped up by a coil. Some true high-tension magnetos are made with a double breaker box, one interrupter mechanism serving the magneto current and the other the battery current. This type of instrument has an induction or transformer coil for building up the voltage of the battery current. It should also be borne in mind that the current obtained from a magneto is alternating, while that from a chemical source of supply, batteries, is direct.

2327 **Pinion Doesn't Mesh.**

From F. L. Hansen, Indiana.—Would like a diagram of the Delco starting, lighting and ignition system used on the 1916 Buick large six. The trouble we have is that when we pull the ignition button the armature does not roll so as to let starter gears

Wiring Diagram of 1916 Buick, Model D54-55.

mesh when stepping on starter pedal, but when gears do mesh the engine starts fine.

Reply.—There may be one or more parts at fault. It may be due to the armature trouble or in the brush contacts which change the instrument from a dynamo to a motor and vice versa. There may

Digitized by Google

be a case of misalignment. Unless familiar with armatures would not advise testing same. Better send unit to the nearest service station.

2328 **Kerosene as a Fuel.**

From G. D. Wood, Arkansas.—Please advise me what the injuries are in using kerosene in a four-cylinder engine properly equipped for burning such fuel, with a double manifold similar to the Wilmo and a double bowl Kingston carburetor with a small water carburetor attached? The engine is a heavy duty type with a bore of 4½ inches and a stroke of 5¾.

Reply.—The use of kerosene in a four-cycle, four-cylinder engine should not be productive of injury if the carburetor or other device properly vaporize the fuel and obtains a homogeneous or dry mixture. Kerosene is practical for the internal combustion engine when it can be so vaporized that the resultant mixture is not affected by variable loads and variable speeds. These factors are the problems which must be overcome before the heavy fuel can be utilized with success in the variable speed, variable load engine. Where the load and speed are practically constant, kerosene can be used with success.

2329 **Wants Estimate on Work.**

From C. R. Hill, New Jersey.—I have a 1916 little Grant Six and wish some advice as to same. The engine in this car has never been equal to or done the work of the other Grant cars. Last spring I had American rings put in, thinking the trouble was due to rings, but the engine isn't what it should be. Now I am thinking very seriously of crating the engine and sending it to the factory. I wrote the factory as to cost and all they could say was that if I paid the transportation and 80 cents an hour they would overhaul the engine. I am at a loss as to what to do. I was under the impression that it was a safe plan to send the engine to the factory but since I cannot get an estimate I might be making a mistake. Will you kindly advise me?

Reply.—The factory or a garageman cannot give you an estimate on an unknown quantity of work; that is, it is not practical to do so, particularly when it is not known what part is at fault. The factory cannot tell what the trouble is until they have made a test or tests. Repairs are based on hours of labor and material although fixed prices are observed for certain well known repairs. We would suggest that you either send the engine to the factory and trust to their ability or take it to a service station or factory branch of the maker. The last named should be able to locate your trouble and give you an estimate as to the probable cost of the work.

2330 **Fixed vs. Variable Spark.**

From J. H. Erkmann, Missouri.—Am taking the liberty of asking you a few questions regarding a model 22 Metz car. 1—The manufacturers advise me that the installing of an adjustable spark magneto in place of the set spark instrument is absolutely of no advantage. Do you agree with them? 2—Can you tell me what are generally considered the advantages of the Metz friction drive, compared to a shaft-driven car? 3—My car is geared 3 to 1. Do you think I would obtain better all around results with a lower gear?

I surely like your magazine. It is very instructive to me and I anxiously await its coming each month. I have saved all of the magazines ever since I have been getting them and I always reread them and find something of value now.

Reply.—1—Opinions differ as to the fixed and variable advance type of magneto but inasmuch as you have asked for our opinion we would state that we believe the variable type superior to the fixed, particularly when the operator uses good judgment as to the proper amount of advance. 2—The advantages of the friction drive as pointed out by the makers are: Light weight, elimination of gears and transmissions, quiet operation, simplicity and a wide range of speeds. It is also claimed that the cost of maintenance is less than with the conventional type. 3—It is doubtful.

2331 **Anti-Freeze for Generator.**

From W. Tunnell, Missouri.—My son has an acetylene generator for making gas in his home and has no place to put it where the water will not freeze. What chemical can be used in the water to prevent its freezing?

Reply.—Use calcium chloride. The amounts to use to prevent freezing and at various temperatures were given in the October number. It is stated by acetylene engineers that the use of the calcium chloride is beneficial.

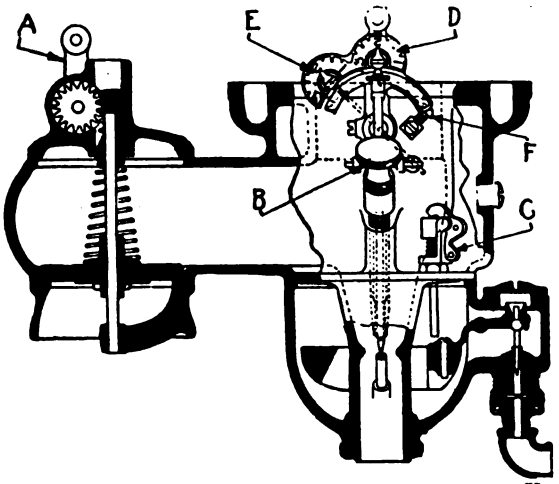
2332 **Repairman Is Right.**

From F. Conklin, New Jersey.—After emptying oil from the crankcase and pouring in a gallon of kerosene is there any danger if I run the engine for one minute to loosen the dirt and sediment? The garageman will not do it for me. Is it necessary to empty out the transmission case and wash with kerosene once a year? Can you tell me where to oil the clutch on a 1916 Hupmobile?

Reply.—Running the engine under the conditions named is a dangerous thing to do. If you wish to loosen the dirt, etc., why not remove the plugs or open the petcocks and crank the engine or spin it for several minutes? This should loosen the deposits, etc., and you will avoid the possibility of damage. The garageman would not do the work as he probably knows the effect of thinning the lubricant in the bearings, etc., by using kerosene. The 1916 Hupmobile has a multiple disc clutch running in oil.

2333 **Information Wanted.**

From H. V. Sweet, New York.—I wish to obtain the address of the maker of a rectifier known as the Rollinson electrolytic rectifier. It is a jar containing an alkaline solution with electrodes of iron and aluminum. Can you advise me where it is made?



Reply.—We have no record of the rectifier mentioned. Perhaps some of our readers may know who makes this instrument.

2334 **Desires Better Mileage.**

From Frank S. Pickering, Texas.—1—Will you please tell me how to adjust the model L Schebler carburetor? How should the air intake (auxiliary

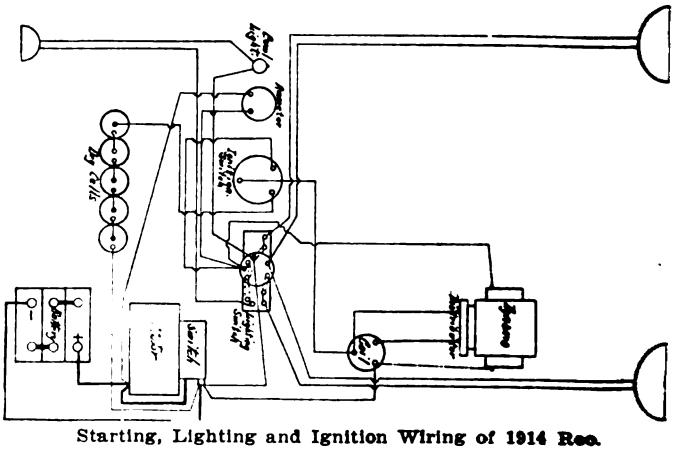
Digitized by Google

intake, I think) operated by a spring valve with adjusting screw on top, be adjusted for a temperature of from 50 to 80 degrees Fahrenheit? Do you need to touch any adjustment other than the needle valve in adjusting this carburetor? I have changed the air adjustment somewhat and would like to know the most economical way this carburetor should be adjusted. It also has a hot air intake.

Showing the Model L Schebler Carburetor With Parts Used for Making Adjustments.

2—Equipped with the model L Schebler carburetor is not 12 to 15 miles per gallon gas a low figure for a car weighing 3,000 pounds? 3—Will attaching a "gas saver" consisting of a copper tube leading from the dash to the intake manifold affect the working of a vacuum gasoline system if the tube enters the manifold through the tube leading from the top of the dash tank (under the hood) to the intake manifold? I am figuring on putting a two-way cock in the intake manifold in lieu of the nipple now tapped in the intake manifold which is a part of the vacuum system, and attaching the tube, ending in a cock on the dash, to one opening of this two way cock. Can I do it without affecting the operation of the vacuum system? 4—I have adjusted my headlights as instructed in your letter to me but they don't seem to focus on the same point in the road; that is, one lights up the road to the left and the other somehow or other fails to illuminate the right side of the road. What is the reason? 5—If it would not be asking too much I would like to hear through the columns of your excellent magazine from drivers of the Lambert car as to proper method of starting the car on a steep hill or other hard pull where it is necessary to have the brake set to hold the car and also necessary to have the engine speeded up so it will not die when the load comes on it.

Reply.—1—In warm climates or temperatures closely approaching those of summer the amount of fuel should be cut down or the supply of air increased. An accompanying illustration shows the carburetor in question with the adjustments marked. These are as follows: A, air valve which should be set so that it seats firmly, but lightly; B, needle valve adjusting screw, practically the low speed adjustment; C, priming lever, used to flush float chamber; F, throttle lever screw or stop, used to regulate butterfly valve. D and E on the numbered dials are for adjusting the intermediate and high speeds. Increasing the numbers, that is, from 2 to 3, for example, increases the supply of fuel. It is customary to set the intermediate pointer back until the engine backfires, then advance it slightly. This obtains an economical mixture for the speed. It is suggested that all adjustments be made thin and until the engine backfires after which slightly increase the fuel supply. This is a matter of experimentation. 2—This is a difficult question to answer as there are so many factors to be considered. 3—We have no record of an attachment being made as suggested but would advise so installing device that tube entering manifold be not near that of the fuel feed member. 4—Bend the brackets until the proper distribution of the rays is obtained. 5—Perhaps some of our readers will give Mr. Pickering the benefit of their experience.



2335 **An Ignition Fault.**

From J. E. Hoyle, Massachusetts.—Please advise me about ignition on my 1911 Overland having a Remy magneto with a transformer coil. The engine will hardly run on the magneto, but when the switch is thrown to the battery side it will run fine. When on the magneto the engine runs on all except the fourth cylinder. Have had several experts look it over. Some say it is the coil. What do you advise?

Reply.—Your question is slightly misleading. You say it will hardly run on the magneto, then add it runs on the magneto and that the No. 4 cylinder will not fire. If the engine will run satisfactorily with the batteries supplying the current and trouble is experienced only with the No. 4 cylinder when on the magneto, it looks very much as if the magneto did not generate sufficient current to overcome the resistance of the gap of the plug in the No. 4 cylinder. Inasmuch as the fault is with the No. 4 cylinder, and assuming that there be no fault with the compression, etc., it should be an easy matter to trace the trouble by beginning with the distributor (No. 4 terminal) and following the wire to the plug. The plug can be easily tested by trying one from the No. 2 or No. 1 cylinder in the cylinder giving the trouble. It is doubtful if the coil be at fault.

2336 **Wants Reo Wiring Plan.**

From E. K. King, Ontario.—Please publish the

Starting, Lighting and Ignition Wiring of 1914 Reo.

wiring plan of the lighting, starting and ignition system used on the 1914 Reo coupe.

2337 **Suggests Salt Solution.**

From W. E. Youngs, Kansas.—At this time of the year I notice you are asked a great many times about anti-freezing solutions. I myself have always used marketed solutions and have found them satisfactory. In my opinion the base of all of these is calcium chloride. A friend of mine, a retired doctor, but now in the ice business, for years used large quantities of calcium chloride in the manufacture of ice. But lately he changed this solution and now uses sodium chloride (common salt) with the same results, and it does not injure the metal container as much as calcium chloride. Now the freezing point of a salt solution would be as low as like solution of calcium chloride. It would not injure the metal as much. So why would not it be a good anti-freeze to use? Of course I realize you must use a saturated solution and no more as the excess would settle and clog up the water circulation. The solution could be made as follows: Take a large amount of rock salt, add about half a gallon more of water than required for the radiator and boil about 30 minutes. Let it cool, after which drain off the water from residue of salt and what crystals that might form around the edges at the top. Use the water for the radiator. This may seem foolish to you, but I would like to have your opinion anyway. I have at different times taken about all of the automobile journals published, but I like yours best of all.

Reply.—The disadvantage of the saline solution is that incrustation or deposits of salt will follow evaporation of the water.

2338 **Reducing Length of Manifold.**

From James L. Whitney, Rhode Island.—I have a 1913 Cadillac that has an intake manifold about 15 inches long and hot water jacketed. After the water becomes warm good results are obtained, but it is next to impossible to start the engine when it is cold, owing to the distance the vapor has to travel and the poor quality of the gasoline. The car has the Cadillac carburetor and the best I have been able to obtain is 12 miles to a gallon. If I should take out the jacketed section and connect the carburetor close to the cylinders would the engine start any easier, and would there be any saving of fuel? I use a gravity feed and if I make the change will use a vacuum and dispense with the water jacket.

Reply.—Reducing the length of the intake manifold should aid in starting, but dispensing with the heat of the water jacketed section would probably offset any advantage gained by the change suggested. This, however, could be compensated for by the use of heat from the exhaust, by the use of a stove.

An Offer for Mr. Risden.

From Albert Lentz, Michigan.—I was interested in the article entitled "An Efficient Fan Belt," and fail to see why C. W. Risden, of California, does not get good service from his fan belt running over such large pulleys, 5 x 8 inches. I used a flat belt, one inch wide, on pulleys 3 x 6, for four years and it was a good belt when I sold the car and is good for two years more.

I have a Saxon Six that has fan pulleys 2½ x 5 inches and one belt has run two years thus far and can't see but what it is good for two years more if not longer. Mr. Risden says that his belts 30 inches long by 1½ inches wide cost $3. I do not know where he buys his belts that they should charge him $3. I have been in the belt game for more than a quarter of a century and I will be only too glad to supply him with his belts for 80 cents each and first-class leather at that. Of course, his pulleys may be out of line, which may be the cause of short service. My first belt was canvas and it lasted but four months. It was the endless type. I then put on a good leather belt that gave me four years' service with prospects of at least two years more.

Will Enlarge Piston Grooves.

From J. P. Hancock, Colorado.—I have a 6-30 1917 Chalmers five-passenger car. Have run it 4,000 miles. I drove this car direct from the salesroom to my garage and personally renewed all the pistons and fitted two Miles' double seal rings. To say this car has 30 h.p. is a crime, besides the cores of my plugs look like they just come out of an oven. My gas consumption has decreased 2¼ miles per gallon city driving and four miles in the country. This is less than I did with the sister to the car. My pet hobby is efficiency. I am a good mechanic, also an electrician. Now I really believe that I can get more from this car. In the spring, when I overhaul the car, I thought of removing the Miles' rings (3¼ x 3/16) and have the top piston ring groove turned to fit a similar ring 3¼ x ¼, taking the metal from the top side of the groove. For the other two rings I will use the step ring that came with the car. The ¼-inch ring I will lap in. My idea is that the grooves in the pistons are too small, causing the patent rings to be manufactured so frail that they soon lose their tension. Now with a ¼-inch ring I would have another 1/16 inch of stock, consequently a more efficient ring and one that should last longer. The piston has stock enough to make the cut. Am I practical? If not, I am open to conviction.

Ed. Note.—Perhaps some of our readers who have had experience with the make of engine referred to will give Mr. Hancock the benefit of their experience. Mr. Hancock states that his mileage has decreased more in the country driving than in the city, whereas generally the figures are reversed owing to traffic conditions.

Says No Harm Results.

From Palmer F. Moe, Illinois.—Concerning J. Chauncey's inquiry (No. 2260) about the use of trailers. About two months ago I took an auto trailer trip with a party of Boy Scouts, 15 in all. We went about 50 miles in all, over all kinds of roads and up rather steep hills. The equipment consisted of a 1912 five-passenger Reo, carrying five boys and their camping material on the running boards. The trailer consisted of a grocery wagon loaned me by a nearby store. It was attached to the car by an iron rod made at the blacksmith shop. This rod was attached to the frame of the car. In the wagon were 10 boys with their luggage, a tent, stove and various other items. After the trip I might say that I noticed no damage or strain to the car. The engine did not seem to notice the extra load at all. As far as I can learn from this trip I think it would be all right for Mr. Chauncey to take his trip.

Automobile Dealer and Repairer

A Magazine of condensed and compact information for busy readers.

Member of the Audit Bureau of Circulations.

Member of the Associated Business Papers.

PUBLISHED THE MIDDLE OF EACH MONTH BY

THE MOTOR VEHICLE PUBLISHING CO.

71-73 Murray Street, New York

Telephone, {7377 / 7378} Barclay — Post Office Box 654

CHICAGO OFFICE, 608 SOUTH DEARBORN STREET

Entered as second-class matter at the Post Office in New York City.

M. T. RICHARDSON, President and Treasurer — F. R. WHITTEN, Secretary

F. R. WHITTEN, Advertising Manager

F. M. DAMPMAN, Eastern Representative — H. F. LUDINGTON, Western Representative

TERMS OF SUBSCRIPTION.

One Copy, One Year, Including Postage $1.00
One Copy, Six Months ..... 60 cents
Single Number ..... 10 cents
Foreign Subscriptions ..... $1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK, JANUARY, 1918.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

A BLOW AT INTELLIGENCE.

The new second-class postage rates established by law at the last session of Congress, to go into effect July 1st next, are a blow at intelligence—a deliberate attempt, apparently, in the guise of taxation, to deprive the people of this country of the opportunity to secure reading matter at prices they can afford to pay.

It was freely stated, when the matter was before Congress for discussion, that there were too many periodicals. One Congressman is reported to have said that 90 per cent. of them ought to be suppressed. Another so-called intelligent Congressman (whose constituents should be profoundly ashamed of him) boasted that he had never read an advertisement in his life. His idea was that publications containing advertisements were an incumbrance in the mails.

The alleged reason for increasing the postage on periodicals was that they were being carried at a loss by the Post Office Department. It was claimed, while the subject was being debated, that the government lost from seventy to ninety million dollars a year.

Not one of those, however, who made this claim was able to prove it. Even the Post Office Department itself had to go on record as "estimating" that the loss was about as stated. No less an authority than the Hon. John Sharp Williams, of Mississippi, defined in the Senate, at the last session of Congress, the word "estimate" to be no better than a "guess." Why doesn't the Post Office Department tell us exactly what the loss is? The reason they cannot do it is that under the present accounting system of the department there is no possible way to find out what the loss is—provided there is any, which is disputed by many publishers. The Post Office Department admits that it is able to carry parcel post packages for three cents a pound and make a profit. Why, then, should they allege that it costs eight or nine cents a pound to handle second-class matter? In point of fact, as Senator Smith of Georgia stated, in a speech on the subject, it is possible to ascertain accurately what it costs to transport second-class matter on the railroads, but it is impossible to ascertain accurately the cost of handling. The Government has to have postmasters and assistant postmasters, regular carriers and rural route carriers, whether or not there is any second-class matter to handle. Second-class matter simply adds something to the burdens of these employees, without apparently increasing the expenses of the department to any appreciable degree.

Thirty years ago, or thereabouts, Congress passed a bill allowing periodicals of all kinds to go through the mails at a postage rate of a cent a pound; and this was done on the ground that such publications were of educational value and that the larger their circulations the better it would be for the people of the entire country. The intention of Congress was to furnish the people with literature at a low rate. The publishers met Congress half-way by giving to the people all the advantage which they obtained from this low rate of postage.

Under this beneficent law millions of dollars have been invested in the publishing business in New York and other large cities. The publishers employ large numbers of men and women in their offices. Thousands of printers are engaged in bringing out these publications. Thousands of men are employed in making the paper which goes into them. Has Congress any right, moral or otherwise, after passing a law to encourage the building up of a great industry, to cripple it, or practically destroy it?

One of the favorite charges among Congressmen hostile to the present second-class rate, is that this rate is a "subsidy" to the publishers. This charge is ridiculous. If there were any "subsidy" about it, the publishers would be making a profit on subscriptions; but in point of fact, the advantage of a low rate of postage, as already stated, was given away to the public years ago by the publishers. If there is any "subsidy" about it at all, it is a subsidy to the people of this country, in the shape of low subscription rates, and the new law, if it goes into effect will compel such an increase in rates that large numbers of people will be deprived of the reading matter they have been in the habit of depending upon.

The Pacific Coast States, and all the far Western and far Southern States will be cut off from cheap periodicals of all kinds, as the publishers will be compelled to seek circulation nearer by. Millions of people are to be deprived of low-priced literature because somebody in Congress "guesses" that it costs more to transport second-class mail than the Government gets for it.

Some Representatives and Senators, while they do not sanction the prohibitive rates established at the last session, seem to think that some kind of "readjustment," as they call it, is necessary. What need is there of a readjustment of second-class post-

Digitized by Google

age rates, any more than a readjustment of the publications in the Agricultural Department, millions of which are sent free of charge to farmers everywhere; or a readjustment of the free distribution of farm and garden seeds?

The publishers are as patriotic as any other body of men in the country. They are perfectly willing to pay their share of the war taxes. They freely surrendered thousands of dollars' worth of space to the Government in advertising the Liberty Loans, to make them a success.

But it can easily be seen that the tremendous increase in postage called for by the new bill, will constitute **double taxation,** which is manifestly unfair, and not even necessary, as the Postmaster General claims that his department last year made a profit of nine million dollars.

Our readers can assist in bringing about a repeal of this new and obnoxious law by protesting against it in letters to their Representatives in Congress and demanding a repeal. We urgently request our readers to lose no time in writing to their Representatives in Congress, and to the two Senators from their State. If you don't know the name of your Representative, ask your postmaster; he will undoubtedly know; and your letter to a Representative should be addressed to House of Representatives, Washington, D. C. Letters to Senators should be addressed to the Senate Chamber, Washington, D. C. The postmaster will know the names of your Senators, if you don't remember them.

A CHEERFUL SUBSCRIBER.

It is a pleasure to receive such a letter as the following from Dr. Charles M. Grover, Grant, New Mexico. He says:

"I see that once again the date has rolled around for renewing my subscription to The Automobile Dealer and Repairer, and I assure you it is a genuine pleasure to renew it, and to feel that for another year I can look forward to its arrival, packed from 'kiver to kiver' with helpful, cheerful automobile lore—with every word on every page replete with knowledge and the pointers that are so vitally useful to both owners and drivers of automobiles.

"I always hail its coming with delight, and hasten to open it up, never laying the new number down until I have, if there is time enough, sketched through it from front to back, including the covers, for even the covers have matter on them that is well worth the attention of the autoist that wants to know something about the best the market carries. In the meantime, here is the dollar for 1917-18, and if you are compelled to raise your price, I'll cheerfully stand the raise."

We are hopeful that Congress will so modify the outrageous law that it passed at its last session, increasing the rates of postage on second-class matter from 300 to 800 per cent., that it may not be necessary to increase our subscription price.

HOW ABOUT YOUR INSURANCE?

Are you carrying enough insurance to cover your loss in case of a fire? It should be borne in mind that everything costs much more now than it did before the war. What would have been enough insurance three years ago, may not come within 50 per cent. of being enough now. Perhaps your policies carry a co-insurance clause, by which, in case of a loss, you would share it with the insurance company.

Look over your policies, and then figure the cost of replacement, both of building and contents. You will probably find that you are very much underinsured, in which case you will be wise to increase your insurance at once. It never pays to take chances. Fires have an unpleasant habit of breaking out where least expected.

While you are about it, do not neglect to insure your car. We have reason to believe that very many car owners are negligent in this respect.

WHY HESITATE.

Those of our readers who may be in a condition of hesitation as to whether they shall renew their subscriptions to The Automobile Dealer and Repairer, or experiment with some other journal, are invited to read the following, from one of our subscribers. He says: "Find enclosed one dollar, for which please renew my subscription to your paper. I was undecided whether or not to renew, as I got a letter from another auto magazine which looked good to me; but in the November issue of your magazine I found in the 'Trouble Department' an article which helped me a great deal."

We are inclined to think that if any subscriber who has been reading The Automobile Dealer and Repairer for a year is in doubt whether or not to renew, that doubt may be removed by a careful inspection of our "Trouble Department," in almost any number.

SLOW MAILS.

Owing to the frightfully congested condition on about all the railroads in the country, the mails are being delayed in all directions.

If your copy of The Automobile Dealer and Repairer does not arrive at the usual time, wait patiently a few days before sending your complaint. Do not forget that The Automobile Dealer and Repairer is not a first of the month publication. It is due to come out the middle of the month, and sometimes we are several days late. If your copy, after waiting a reasonable length of time, fails to come, drop us a postal card, and we will send you another. Sometimes copies are lost in the mails.

Subscribers, in asking to have their addresses changed, should always remember to send us their old address, as well as the new one.

SHALL WE INCREASE OUR SUBSCRIPTION RATE?

Most of our readers are aware that a clause was embodied in the Tax Bill at the last session of Congress increasing the rate of postage on second-class matter from 300 to 800 per cent., to begin next July. At that time it is going to be a serious problem with publishers what to do about subscription rates. With second-class postage at a cent a pound, where it has been for about 30 years, we can publish The Automobile Dealer and Repairer for a dollar a year, and not lose very much by it.

It may come as a surprise to a great many readers to learn that the actual cost of paper, printing and binding for The Automobile Dealer and Repairer for a year is from $1.20 to $1.30. When we

Digitized by Google

get a dollar for our publication for a year, we are losing between 20 and 30 cents on the bare cost of manufacturing it, to say nothing of rent and office expenses.

Many will say, "How can you afford to do it?" The answer is that the returns from advertising not only reimburse us for whatever losses there may be on subscriptions, but also give us a profit. Subscribers, therefore, to any journal, no matter which one, are under obligations to advertisers. But for them, subscription rates would be three or four times as much as they are now. There is a point, however, below which no publication can go and be published at any profit whatever.

One of our subscribers, in sending us a dollar recently for a year's subscription, wrote as follows: "I would not want to be without your magazine at double the price."

How many of our readers would be willing to pay double the price—$2.00 a year—for The Automobile Dealer and Repairer? How many would be willing to pay 50 per cent. or more—$1.50 a year? The increase of 50 cents would not make us quite whole on the new postage, but it would help considerably.

We wish our readers would consider this matter and write us about it. We would like to know their views. Is the reading-matter (to say nothing about the advertisements) contained in 12 issues worth to you $1.50 a year?

AUTOMOBILES IN ARGENTINA.

The Bureau of Foreign and Domestic Commerce of the Department of Commerce, Washington, D. C., Burwell S. Cutler, Chief of Bureau, has recently brought out a bulletin, "Miscellaneous Series No. 62," giving particulars with respect to the demand for motor vehicles in Argentina and the prospects for working up business in that country, not only on passenger cars, but motor trucks, farm tractors, accessories, etc. Any reader can obtain a copy of this document by sending five cents in coin to the Superintendent of Documents, Washington, D. C. Postage stamps will not be accepted for public documents by the Government.

FALSE ECONOMY.

Occasionally we receive a letter from a subscriber who has decided to stop his subscription because of the demands upon his purse from various sources, as a result of the war. He thinks he must economize.

Is it ever real economy to stop your subscription to such a valuable and practical magazine as The Automobile Dealer and Repairer? In almost any number information may be obtained really worth far more than the insignificant subscription price of a dollar.

We advise our readers to subscribe as liberally as they can to the Red Cross, the Y. M. C. A., and other associations formed for the alleviation of conditions growing out of the war; but not to cut out their favorite journals for economical reasons. That course would be, in every case, probably, false economy.

Canada raised its letter rate to three cents, but had the wisdom to let the second class postage alone; and is still carrying all its perodicals at a quarter of a cent a pound.

No Race Sanction During War.

There will be no sanctions granted for race meets during the period of the war. The contest board of the American Automobile Association met recently and made this decision. This means that racing is to be abandoned until after the war. One of the several reasons for the step is that the government is in need of expert mechanicians. There are over 1,200 drivers and mechanics registered with the A. A. A. The contest board adopted the following resolution:

"Whereas our country is in a state of war in which our entire available man power is needed for national activities; and

"Whereas the national need for skilled workmen in numbers greater than it is possible to furnish is urgent; and

"Whereas the national need for mechanics, automobile drivers and others skilled in the care and maintenance of motor apparatus, that is playing such a leading part in the war, is imperative; be it therefore

"Resolved, That it is the sense of the contest board of the American Automobile Association that it will not sanction automobile contests during the period of the war exigency and that during the aforesaid period the rules of the contest board shall be suspended."

President Voices Approval.

The decision of the American Automobile Association to discontinue racing until after the war has been commended by President Wilson, who thus voices his approval:

"I am very glad indeed to learn that it is the purpose of the American Automobile Association to stop automobile racing until after the close of the war. It is so destructive of materials and involves so great a consumption of gasoline that I think every man who cares for the proper fulfillment of our duties during the war and the necessary conservation of resources which the performance of those duties involves must applaud the action of the association in this matter. Faithfully yours,

(Signed) "WOODROW WILSON."

Convict Labor on Roads.

Missouri is to employ 500 convicts on road work. It is likely that the first road to be built by convict labor will be the Columbia-Jefferson City road, which will link the State university with the State capital. Arrangements for the construction of a permanent highway over this route have been under contemplation for several years, and the drafting of Missouri's quota caused a labor shortage which threatened to check road building indefinitely. Prison labor became the solution as a result of the abolition this year of prison contracts.

Form Minnesota Motor Reserve.

Minnesota motorists are organizing motor reserve corps to assist in the transportation of army and government officials within 300 towns and within reasonable radius of such towns. Hundreds of owners of passenger cars have offered their cars and services to the government. Secretary Baker has approved the plan. Similar organizations may be effected throughout the country, it is said.

Considering Various Methods of Charging the Storage Battery

Describing the Advantages and Disadvantages of Chemical and Mechanical Apparatus and How Pressures Are Best Controlled

BY SYDNEY F. WALKER, M. E.

There is one other method of accomplishing the result aimed at, reducing the magnetic pressure in the same proportion as the speed was increased, and that is by increasing the magnetic reluctance of the dynamo, this being accomplished by displacing the armature longitudinally in the polar space in which it revolves. It has been explained that the number of lines of force present in the armature core, and in the space in which the armature cores revolve, depends directly upon the resultant magnetic pressure, and inversely upon the magnetic reluctance of the magnetic circuit. It was also pointed out that the magnetic reluctance depends directly upon the length of the path the lines of force have to traverse, and inversely upon the sectional area of that path, also that the magnetic reluctance of air is enor-

g. 29—Illustrating the Leeds Forge System.—The Armature Is Displaced Longitudinally to Neutralize Increase in Speed.

ously greater than that of iron, and that that was ie reason why the pole pieces of the field magnets 're made in crescent form so that they can embrace ie armature as fully as possible.

It will be obvious that if the sectional area of the r spaces between the pole pieces and the armare core is reduced by forcing the armature out of s position, the magnetic reluctance will be ineased and the equivalent will be obtained, if the lculations are correct, of the reduction of the magtic pressure by the creation of secondary and teary magnetic pressures as described above. Fig. , A and B, show the arrangement diagramatically. ie writer is not aware of its having been introced yet for dynamos employed in motor car lightg, although it is used in one form of engine starter, but in the opposite way; that is, the armature is pulled into position and a pinion on its axle is pulled into mesh with teeth on the fly wheel of the car engine.

Principle Involved.

The principle is the same, although it is applied in the opposite sense. The method has been employed by a large firm in the United Kingdom in train lighting by electricity and the writer believes has been adopted by several railway companies. In the arrangement the armature is mounted on a sleeve, which runs on the axle, instead of directly upon the axle itself. Power is delivered from the axle to the armature sleeve by the pin shown in the drawing. It will be noticed that the pin is free to move in a V-shaped slot, and when the armature is running the pin tends to ride along the slot, and to force the armature out of its position longitudinally. A regulating spring on the other end of the armature axle keeps the armature in place when at rest, and until the speed rises above a certain figure. It is claimed that no action takes place except when the speed has risen to a figure such that the pressure furnished by the dynamo would be above that required to charge the battery.

Using Batteries Only.

There is one other method of dealing with this problem and that is by having the batteries of sufficient size for all the requirements of lighting and starting, and of such size that they will hold their charge for the day's run and charging them when the motor car is in the garage. The writer favors this method very strongly, as he believes that it would lead to simplification of the arrangements on the car. It has already been established by American as well as British practice that it is best for the motor to be a separate machine from the generator. If the plan suggested is adopted, that is, a battery of batteries sufficient for all the work that electric currents have to perform is carried on the car, the whole thing will be simplified very considerably. The switchboard would be much simpler if the battery was of sufficient size, and there would be little necessity for the driver to give any attention to the electrical portion of the apparatus except to switch lights or horns on and off and to switch the starting motor on. If this plan is adopted care must be taken that the battery is large enough. A good deal of the trouble with batteries in the past has been due, in the writer's opinion, to the cells being too small.

Cause and Effect.

Automobile engineers and mechanical engineers generally fully understand what happens when an engine is put to do more than the work for which it is designed. If it is very well made it will try to do the work, but usually some of the parts will be

Digitized by Google

strained and a breakdown occurs later on. Similarly, if a battery has a larger current demanded from it than it has been designed to supply, it will furnish the current but with disastrous results to the battery. The Edison battery is claimed to have many advantages over the lead type, inasmuch as the same

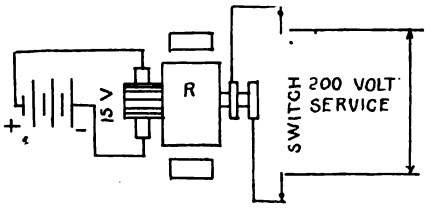

Fig. 30—Showing How Charging May Be Performed with a Rotary Converter.

care is not required to prevent overcharging nor to prevent its being run down.

As with the lead battery, it is recommended that the Edison cell be not allowed to fall below a pressure of 0.9 volts per cell, but it is claimed that nothing serious will happen if the pressure the cell furnishes goes right down to zero and is left there for a considerable time. All that is necessary is a little care in charging up again. As has been pointed out, if the lead cell is allowed to fall much below a pressure of 1.8 volts per cell trouble always follows, and the longer the low pressure is allowed to remain the greater will be the trouble. The Edison battery has a very distinct advantage in its greater mechanical strength but against that is the necessity for maintaining effective insulation between the active plates and the containing vessel.

The writer understands that no difficulty has been found in accomplishing this so that the Edison battery should be a distinct improvement. The Edison has also the advantage over the lead battery in that it welcomes a boosting charge whenever it can be applied. With motor cars touring the country it may often be possible to "boost up" the battery during lunch. The writer looks forward to the time when every hotel, in addition to providing garage accommodation, will also provide a supply of current for charging the batteries of motor cars. In America the engineers of electricity generating stations are very much alive to the advantage of supplying charging current for batteries. They have learned the lesson which our engineers are slow to learn, and that is that every unit of current that can be sold makes good business and that there are long periods in every day when batteries could be charged.

Charging in the Garage.

The question arises as to whether it is economical to charge batteries in the garage or at generating stations in place of charging them from the dynamo carried on the car. The principal reason for suggesting that the battery should be charged in the garage, or in any other manner convenient from sources of current outside of the car, is to simplify the electrical arrangements on the car. The arrangement of a battery supplying current to lamps, ignition apparatus, horns and starting motor, is exceedingly simple. But immediately a generator is added to the apparatus, although it renders the car independent of outside sources of current, it enormously increases the complication. It obliges at any rate the automatic switch to be added, and up to the present it has been the practice to provide one or other of the apparatus described for maintaining the pressure furnished by the dynamo at the required figure.

Is Wasteful of Current.

The point that will be raised against charging batteries by outside sources of current is that a certain amount of waste is inevitable, but under the very best conditions obtainable with a dynamo carried on the car the efficiency must be very low. That means waste that may easily be equal to or greater than the waste inevitable when charging from an outside source of current. The efficiency of the small dynamo employed on motor cars can hardly be greater than 70 per cent. at the best, while the compensating arrangements described will nearly always reduce the efficiency to 50 per cent. or less, that is to say, the cost of charging the battery in fuel will be twice that represented by the actual current furnished.

The arrangements for charging batteries in the garage or in generating stations depend upon the current supplied. If it is continuous current at 200 volts or thereabouts, two courses are open. The pressure of the current may be reduced by the insertion of a certain number of incandescent lamps arranged in parallel, as shown in Fig. 31A, to obtain the pressure required by the battery. This is a very wasteful method. The waste was not of much consequence where the batteries to be charged were the small cells used for ignition but it would be quite serious with the cells that it would be necessary to carry if the suggestion made above were carried out.

It would be wasteful in two ways. First, the current passing through the lamps would be wasted unless it could be so arranged that they were employed to light some portion of the establishment while the charging was going on. This might be possible where charging took place regularly every night.

An Economical Method.

A better method, one that would probably be more economical than running lamps in series with

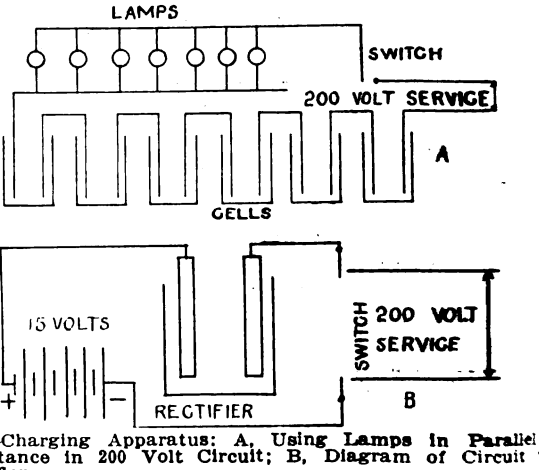

Fig. 31—Charging Apparatus: A, Using Lamps in Parallel as Resistance in 200 Volt Circuit; B, Diagram of Circuit with Rectifier.

the battery, would be to fix a small motor generator to reduce the pressure from that of the supply to that required by the battery. This arrangement is shown in Fig. 32A. The motor-generator consists, in the case of continuous current service, of two con-

Digitized by Google

tinuous current machines, as shown in the diagram; one running as a motor and taking current from the supply service at the 200 volts or thereabouts, and driving the other as a generator, the second machine furnishing the current required by the battery at the pressure required.

The axles of the armatures of the two machines would be coupled together, and it would be possible to vary the pressure furnished by the generator, if required, by a variable resistance in the field magnet circuit. Machines have been made that will perform the conversion in one machine as shown in Fig. 32B. In these machines there is only one set of electro magnets and one armature, but the armature has two commutators, one at each end and two windings. A fine wire winding to take the current at the higher pressures from the supply service and a comparatively thick wire winding to generate the larger current at the lower pressure. Either machine will answer the purpose and in the writer's opinion the waste would not be greater than that incurred by the small dynamo on the car.

Methods of Charging.

Where the supply is alternating current, there are again two methods. A rectifier which is at the same time a pressure absorber may be placed in the circuit, as shown in Fig. 31B. The rectifier is a special form of galvanic cell in which usually aluminum is employed. It has the property of stopping the negative currents by building up an oxide and allowing the positive current to pass through. The efficiency of the apparatus is necessarily low and it has the disadvantage of being another chemical apparatus to look after. By the other method, either a motor-generator or a converter may be employed, to convert the alternating currents to continuous currents.

The motor-generator is very similar to that described for use with continuous currents, but the motor is made to work with alternating instead of continuous currents. The converter is an apparatus that is a good deal employed in the distribution of electric currents from generating stations. It is an adaptation of the machine described above in which the conversion of continuous high pressure to low pressure was accomplished in one machine. In the alternator current converter the current is converted from alternating to continuous, and the pressure is lowered, if required, by the same operation. The machine is constructed like a continuous current machine and has an armature wound as a continuous current armature and a commutator similar to continuous current machines. If driven by any source of power it will furnish continuous currents which may be taken from the brushes in the usual way.

How Armature Is Wound.

The windings of the armature are tapped at certain points, the tappings being connected to copper rings carried on the axle on the opposite side of the armature to the commutator. The copper rings, which are known as slip rings, are insulated from the axle and from each other and carbon brushes bearing against them delivering currents to them or take currents from them. When the converter has continuous currents delivered to its commutator it runs as a motor and delivers alternating currents to the brushes bearing on the slip rings at a pressure which bears a fixed proportion to the pressure of the current delivered to the commutator. When alternating currents are delivered to the slip rings the armature runs as a motor, the field magnets receiving currents from the brushes just as if the machine was running as a generator, and currents are generated and delivered to the brushes bearing on the commutator in a fixed proportion to the pressures delivered to the slip rings. There is always a fixed ratio between the pressure on the alternating side and those on the continuous current side, and so no lowering of pressure is practicable by the machine itself. The pressure is lowered to the figure required to produce the necessary continuous current pressures by the aid of static transformers.

The Static Transformer.

The static transformer is another apparatus that is largely used in the distribution of electric currents for light and power. It is practically an induction coil in which the proportion between the primary and secondary wires is the same as that between the two pressures, that of the supply service

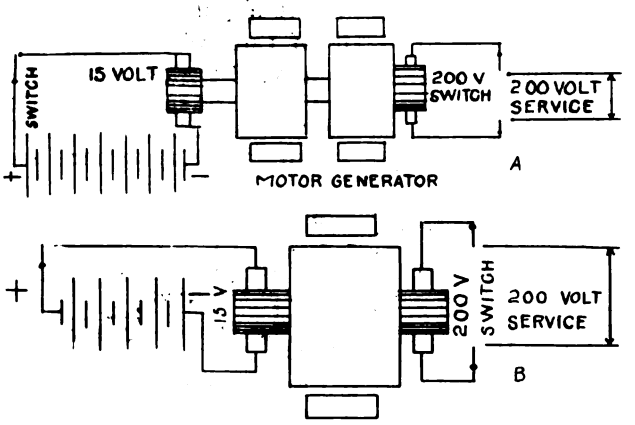

Fig. 32—Charging Storage Batteries: A, Using Motor Generator to Reduce Pressure; B, Using Dynamo Having Two Armatures and Two Sets of Coils.

and that of the lamp, or in this case the battery service. With a supply service of say 200 volts, and a continuous current charging pressure required of 15 volts, the pressure of the supply service would be reduced to a little over 20 volts on the alternating side of the converter by a static transformer in which the ratio between the number of turns of the primary and secondary wire would be about 10 to 1.

Fuel Supply Is Limited.

Automobiling is growing in favor with the Seville, Spain, people, and country races, speed trials, and hill-climbing contests were recently held with considerable enthusiasm. At present automobile owners are having much difficulty in securing gasoline, owing to a serious shortage of that commodity in Seville, and the matter has been taken in charge by the automobile society of the city, which is allowing only 2 liters, or a little over half a gallon, of gasoline a day to each of its members except in cases of emergency.

Oil and the Commutator.

Keep the commutator or timer clean and renew the supply of oil with a clean, thin lubricant in cold weather. Dirty oil, particularly when foreign elements are present, such as metal dust for example, set up a considerable resistance to the passage of the current.

CONTROLLING GARAGE HEAT.

An Automatic Device Said to Compensate for Variable Temperatures.

"Last winter I fitted a gas-heated garage boiler but my gas bill was rather higher than I had expected. Putting on my thinking cap I reasoned that what was really needed was some means of turning down the gas when the thermometer was well above 32° Fahr., and of automatically turning the gas flame up when there was the slightest sign of Jack Frost paying a visit," says a writer in The Autocar. "After a lot of experimenting I hit on the plan described below; it works very well—in fact better than I expected—and can be made very cheaply by any one able to use a few tools. I may say I have adopted the Argand type of burner, as the Bunsen type is so liable to blow back. The general idea is shown in the diagram, which is not to scale, as sizes could be varied considerably without affecting the principle and working of the apparatus.

Principle of Control.

"An outer tank A has a lid B which can be made gastight at the joint F. I used for my experimental model a syrup tin. The gas inlet tube soldered to the lid B has its lower end faced up square so as

An Automatic Gas Control Device Reducing the Volume of Gas Passing to the Heater as the Atmospheric Temperature Rises.

to form a seating for the valve, but has one or two notches cut so as to provide a leakage supply of gas even when the valve is closed. The leak supply is just enough to keep the gas burner from going out altogether.

"The leather-faced type of valve is not necessary, as the valve is intended to be leaky. It merely consists of a brass disc soldered to a spindle which has also a dual guide consisting of perforated discs in the tube at the top and a guide at the bottom end. The spindle or float rod also carries a float fixed to it. I used a carburetor float from an out-of-date pattern carburetor which may be readily obtained for a few cents from any motor junk dealer, but could easily be made from tin or zinc. The lid B also has soldered to it the inner casing C, which is open at the bottom, so that when in position there is a gas space D in the inner chamber and an air space E in the outer chamber.

How Device Operates.

"From the outer chamber E an air pipe is led to an air cylinder, which is preferably placed outside the garage so as to be exposed to the outer air, and therefore more readily affected by climatic temperature variations. The gas burner is connected to the outlet pipe, and by means of the vent tube the apparatus is filled with very light engine oil. The gas may now be turned on and then more oil added until the float rises and just closes the valve. If now the temperature falls, the air in the air cylinder will be reduced in volume; that is, contract, and therefore the oil level in E will rise and the level in D naturally fall, thus opening the gas valve and so increasing the height of the burner flame. The diagram shows this condition of affairs; that is, temperature near freezing point. When the outside temperature increases the reverse action will take place; the air in the air cylinder will expand, force down the level of the oil in E, raise the oil level and the float in D, and thus close the valve and reduce the quantity of gas passing to the burner.

Economical of Gas.

"The volume of the air cylinder should be at least fifty times the volume of air space E, and this air space should be at least equal to the volume of D. I use a five-gallon oil drum for my air cylinder; it must be quite airtight, of course, and the same applies to the pipe leading to it. The apparatus works exceedingly well, and can be readily adjusted to cut down the gas at any required temperature. The saving in gas is obvious. I cannot imagine any other system of garage heating being more economical, and there is really nothing to get out of order."

Harsh and Slipping Clutches.

Various remedies are suggested for harsh acting leather-faced cone clutches, but as a rule the relief is temporary. A more efficient repair is to insert a number of old hacksaw blades or similar strips of material under the leather at points diametrically opposite to one another.

To do this, the clutch cone should be removed or the clutch fully disengaged. Raise the rear edge of the leather with the blade of a screwdriver, so that a thin strip of metal may be driven underneath the leather. The insertion should extend from one side of the cone to the other. Rotate the clutch and insert a strip exactly opposite. Then place two intermediate pieces at equal distances from the first, and so on, using six or more. The strips must be opposite each other or the balance of the clutch will be disturbed.

The metal strips raise the leather slightly at six points, and these parts must be compressed before the grip of the entire clutch surface is obtained, and the engagement is gradual. The same method may be utilized to cure a slipping clutch due to the leather becoming hard, but the remedy will be temporary. If the action of the clutch is harsh after fitting a new leather, treat it with neatsfoot or castor oil, and if this fails to obtain the desired results sprinkle the leather lightly with powdered graphite, which will obtain a polished surface.

According to official and semi-official figures, the Italian motor industry produced, in 1916, 21,100 motor vehicles of all kinds and employed about 26,000 workpeople. The Fiat heads the list with 15,000 cars and 20,000 employees. This company claims to have supplied a greater number of motor vehicles to different allied armies than any other factory in the world, the number delivered up to the end of last year being 68,000.

Digitized by Google

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.
The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusable accident of a collision at a railway crossing.

The number of inexcusable accidents, those resulting from the brakes not acting or holding properly and from collisions with railroad trains, is increasing. Despite the warnings issued by the railroads, motorists continue to attempt to cross tracks without exercising proper caution. Fully 75 per cent of the fatalities of the past month were caused by carelessness. There is an increasing number of accidents due to the brakes not working, at least the brakes are blamed for the accident. There is no excuse for the brakes not operating as they should. The motorist has warning as to when the efficiency of the brakes decreases, but if one persists in putting off their repair until tomorrow he invites trouble. With the average car equipped with two sets of brakes there is no reason why one should not work, should not hold the machine on a steep grade and check or stop its movement within a reasonable distance. It is to instil the habit of caution that the Lessons for Drivers are published.

Brakes Failed to Hold.—A woman, the owner of an expensive car, was killed in Maryland recently when the engine stalled on a steep hill. The chauffeur applied the brakes, but they failed to hold the car, which ran backwards and overturned.

Clutch Not Disengaged.—Failure to disengage the clutch and to place the gearshift lever in neutral, caused the death of an owner near Boonville, N. Y. The motorist started to crank his engine without noting if the gearset was in a neutral position. The engine started and the car pinned the owner against a telephone pole.

Light Failed.—The combination of faulty lights and brakes caused the death of two persons just outside of Denver, Colo., recently. The party was returning from a trip when the lights went out on a steep grade. The brakes failed to hold the car, which ran off the road and plunged 40 feet to the bottom of the grade.

Killed by Train.—Neglecting to observe the signs of the railroad to "Stop, look and listen" was responsible for the death of two persons at Carthage, O. The tracks were partly obscured by a long sign, but had the driver observed due caution the accident would have been avoided.

Brakes Cause Skidding.—The too sudden and harsh use of brakes caused the death of a state official's wife near Wilmington, Del. The accident took place in a storm and was primarily caused by the sudden appearance of a team. The driver of the motor car applied the brakes too vigorously, causing the machine to skid and turn turtle.

Cigarette Causes Fatality.—The death of a motorist and his friend near Vincennes, Ind., is blamed to the cigarette. It is stated that the driver tried to light a cigarette, as he was in the habit of doing when driving, and the car swerved off the road, striking a rock. The machine turned turtle, instantly killing both men.

Fatal Race With Train.—An accident resulting in the death of two persons and said to be the result of trying to race a train to a crossing took place outside of Milwaukee, Wis. The automobile was totally demolished.

Brakes Failed to Hold.—While working about his machine near Lancaster, Pa., an aged man was killed when the brakes released and the car rolled backward down an incline, crushing the owner against a wall.

Causes Broken Leg.—Failure of the driver to note if the gears were in neutral and brakes set resulted in a broken leg for the chauffeur, who cranked his machine on a ferryboat as it was nearing a landing in New York harbor. The car plunged through the gates into the river.

Skidding Fatal.—The skidding of a car on a bridge just outside of Portsmouth, N. H., resulted in the death of one passenger recently, the machine crashing into a telegraph pole.

Hat Causes Fatality.—The loss of a hat by a passenger of a touring car led the driver to apply the brakes too harshly and as a result it turned turtle, killing one and injuring four. The driver was a woman and the accident occurred just outside of Theresa, N. Y.

Brakes Failed to Hold.—Failure of the brakes to hold a loaded truck on a grade near Fort Lee, N. J., cost the driver his life and probably fatally injured the helper. The machine ran off the road and dropped 40 feet.

Racing Injures Three.—Crowded off the road by two cars which were being raced by their drivers, near York, Pa., a machine driven by a third party ran over a bank and upset. Three were seriously injured.

Another Accident Due to Hat.—Turning his head to see where his hat had been blown cost the driver of a machine his life near New Rochelle, N. Y., recently. The machine left the road and crashed into a tree.

Response to Appeal Is Gratifying.

The response to the appeal for skilled automobile mechanics for service with the repair and maintenance division of the Signal Corps is very gratifying. Many men have left good positions, and a large number of chauffeurs have responded to the call.

Relative to the continued need for more such men the Committee on Public Information says:

"Thousands of chauffeurs and mechanicians are needed to support the American airmen behind the lines in France. The supply of skilled men of this sort is limited and every man with the proper qualifications will be given an opportunity to fill an immediate and valuable place in the great air army. Chauffeurs are needed, not so much to drive cars, but to do all the important mechanical work in connection with airplane engines, for which their training and experience especially fit them."

Recent Legal Decisions of Interest

A limited agency contract for the sale of automobiles provided that the principal would not be bound by requisitions, but would do its best to fill them. The agent made a requisition for six cars, which the principal refused to ship. The requisition stated that it was "under our limited agency contract." The South Dakota Supreme Court holds, Kilker vs. Ford Motor Co., 164 N. W. 57, that the failure of the principal to ship the automobiles did not render it liable to the agent. It is within the power of the principal and the limited agent, when contracting, to insert into the contract a stipulation relieving the principal from liability for failure to honor requisitions of the agent.

Lease or Conditional Sale of Automobile.

An agreement with an automobile dealer provided that the dealer thereby leased an automobile for one and one-half years; that it should remain the property of the lessor; that the lessee should pay for its use $25 a month until $317.70, with interest on that sum, should have been paid; that when that sum had been paid in full the lessee might use it free of charge for the remainder of the term; that on failure to make such payments it should be lawful for the lessor to take possession, and the payments should be forfeited; that if the lessee should desire to buy the car during the term, all money paid as rent should be applied toward the purchase, and the price should be $317.70 with interest; and that until the lessee should avail himself of such option and pay such amount in full, the ownership of the automobile should remain vested in the lessor. The Massachusetts Supreme Judicial Court holds, Hurnanen v. Nicksa, 117 N. E. 325, that the agreement, though in the form of a lease, constituted a conditional sale. Under the Massachusetts statute providing for the registration of automobiles by the "owner" thereof, the registration of an automobile, sold conditionally with a reservation of title until paid for, in the name of the buyer, was held not invalid, so as to impose liability for injuries sustained in a collision with the automobile, as in the case of an unregistered automobile.

Storage Contract—Sale of Garage Business.

In an action for damages to the plaintiff's automobile it appeared that the defendant contracted to store the car in his garage and render incidental services. He subsequently sold his business. The Michigan Supreme Court holds, Banks v. Strong, 164 N. W. 398, that the contract continued until the plaintiff consented to change it or until he had notice that the defendant would no longer undertake to perform it. A mere sale of the defendant's business did not relieve him from performance of the contract where the plaintiff had no notice thereof, and hence, notwithstanding such sale, he was liable for damage sustained by the car while it was being taken from the plaintiff's residence to the garage by a garage employee.

Driver's Duty in Passing Wagon.

An automobile was turning to the left to pass a wagon on the tail of which was seated a six-year-old boy. When the automobile was within a few feet of the wagon the boy jumped down and ran in such a direction that a fender of the car struck him, though the driver applied his brakes an instant before striking the boy. The Iowa Supreme Court holds, Bishard v. Englebeck, 164 N. W. 203, that the driver was not bound to anticipate or know the intentions of the boy, and was not negligent in failing to give a signal of his approach and of his intention to pass the wagon.

Torts of Servant—Scope of Employment.

The South Carolina Supreme Court holds, Knight v. Laurens Motor Car Co., South Carolina Supreme Court, 93 S. E. 869, that where a defendant motor company's mechanic, who sometimes operated cars for transportation of passengers, took the defendant's car at night for a joy ride, the motor company was not liable for the mechanic's torts while on such trip. And retaining the mechanic in its employ after knowledge of his tort would not constitute ratification, binding the employer.

Damages for Injuries Caused by Street Excavation.

A physician, returning home in his automobile at night, drove into an excavation which had been made in the street for the laying of a gas pipe, because of the want of a red light, resulting in injury to himself and his car, for which he sued the construction company and the city. He testified that he was driving between 10 and 15 miles an hour, saw a white light on the sand pile, and drove around it according to regulation. The defendants contended that the plaintiff was guilty of contributory negligence on his own evidence that he was driving over 10 miles an hour in violation of a city ordinance. It was held that it did not follow that the unlawful speed was the cause of the injury. The plaintiff's negligent speed would not bar recovery unless it was the proximate cause of the injury. Judgment for the plaintiff was affirmed. Hardy v. West Coast Const. Co., North Carolina Supreme Court, 93 S. E. 841.

Liability for Acts of Daughter Driving Car.

The Virginia Supreme Court of Appeals holds, Blair v. Broadwater, 93 S. E. 632, that the liability of a father for injuries caused by an automobile owned by him, while being operated by his daughter, cannot be based on the mere relationship of parent and child, but must be based on the relation of master and servant; and a daughter is not using an automobile in her father's business, so as to create the relation of master and servant, merely because the automobile was purchased for the use and pleasure of the family, and is being used by her for the precise purpose for which it was purchased.

Rights of Mortgagor of Automobile.

Although a mortgage on an automobile is past due and unpaid, the mortgagor has such property rights in the car as entitles him to maintain an action for injury to it.—Martin v. Seaboard Air Line Ry. Co., South Carolina Supreme Court, 93 S. E. 336.

According to H. L. Brownell, manager of the Detroit, Mich., Safety League, Detroit occupies first place in the matter of accidents. Street car accidents have increased 100 per cent. and automobile injuries 185 per cent.

THE DEADLY EXHAUST GASES.

How Carbon Monoxide Can Be Avoided in the Garage and Heat Conserved.

The occurrence of a number of accidents, some of them fatal, whereby people have been overcome through breathing air that has been vitiated by the exhaust gases from internal combustion engines discloses a hazard that is more serious than it is generally conceded to be. The Automobile Dealer and Repairer pointed out this danger in the December number and is again calling the attention of its readers to the particularly hazardous practice of operating an engine with the doors and windows of the garage closed.

Is Odorless and Colorless.

For the benefit of the new subscriber it is explained that carbon monoxide is a colorless, odorless and tasteless gas. It is extremely poisonous because it combines with the red coloring matter of the blood more readily than oxygen does and blood that is saturated with it cannot take up oxygen. Exposure to an atmosphere containing 20 per cent. would doubtless cause a man at rest to collapse within an hour and exposure to as little as five per cent. causes headache in several hours' time. The dangerous

Suggestion for Conveying Exhaust With Its Deadly Monoxide from the Garage.

symptoms come almost without warning and collapse in a garage would prove fatal unless outside aid arrived very soon, because the operating engine would continue to generate carbon monoxide and continue to make the air more poisonous.

Where It Exists.

Experiments show that there is a slightly higher per cent. of carbon monoxide nearer the floor than six feet above it. Dangerous amounts of the poison will be found present in the farthermost part of the garage and after the engine had been run a few minutes. The tests further proved that it is highly dangerous near the car.

It has been suggested that the windows and doors be left open. While this might avoid to a certain extent the possibility of a sufficient quantity of monoxide gathering to be fatal, it means a cold garage. And it is the conservation of the heat that has proven fatal in cases of monoxide poisoning.

Avoiding the Danger.

The only practical method, if the engine must be run in the garage, is to devise some method of getting rid of the dangerous exhaust. An accompanying illustration suggests a method that can be utilized in the small or private garage where economy of heat is practiced. The method consists of conveying the exhaust gases from the muffler pipe or outlet by means of flexible metal hose to the outer air.

With those types of exhaust pipes having a taper the flexible metal tube can be slipped over them, provided the inside diameter of the tube is slightly larger than the diameter of the pipe. The flexible metal tube can be led through the door, side of building or other convenient way. With fan-shaped exhaust pipe the suggestion at B will be practical. It consists of rolling a piece of heavy tin as shown at A and to a diameter sufficient to make a snug fit in the flexible pipe. The tube should be made at least eight inches long to permit of so anchoring it in the piping that the possibility of leakage will be avoided. If necessary the tin tube can be soldered to the flexible member.

Preventing Leakage.

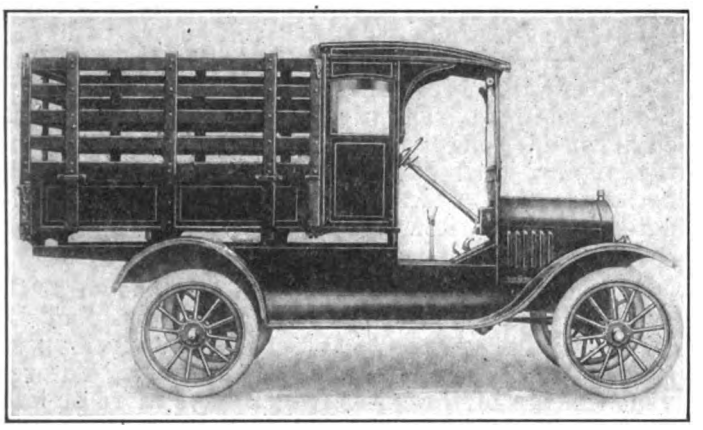
Where the exhaust pipe is flared as shown at C, the tube should be compressed as indicated at B, and it should be bent to conform as nearly as possible to the shape of the exhaust member. To prevent leakage of the gases, which have more or less pressure, the end of the exhaust can be wrapped with asbestos or asbestos fitted to the part A.

Ordinary rubber hose cannot be utilized nor can friction tape be employed to seal any leaks in the exhaust line of the device owing to the heat given off by the exhaust gases. While a slight back pressure may result from the use of the flexible pipe for getting rid of the carbon monoxide, it should not be sufficient to interfere with the operation of the engine. Not only will the arrangement permit of working in the garage and around a running engine with safety, but additional heat will be provided from the flexible tube. The flexible tube can be secured of various diameters at any supply house or direct from the makers.

The Modern Gasoline Automobile.

The 1918 edition of the Modern Gasoline Automobile, by Victor Page, M. E., and dealing with its design, construction, operation and maintenance, has made its appearance. The new edition is much larger than its predecessor, considerable new material having been added, to say nothing of illustrations. A feature that should appeal to the laymen is the clearness with which the author presents his subjects. Much of the new material deals with tractors, plows, etc., bringing the contents of the book thoroughly up to date. The book is published by the Norman Henley Publishing Company, New York City, and lists at $3.00.

Increased Use of Cars.



An addition is being made to the motor car house near the Balboa station of the Panama Railroad to add four bays for automobiles under repair, including two new pits, and to extend the workroom. The original two-story building was designed for railway motor cars only; in July, 1916, a one-story extension was made, to contain five bays and repair benches for highway motors, and the new addition will make nine bays. There are four repair pits, 17 feet long, and one of extra length, 27 feet. The addition is necessary to keep pace with the increased use of automobiles in the government service.

NEW PARRY BODY.

Is a Convertible Farm and Stock Body and Adapted to Ford Chassis.

The Parry Mfg. Co., Indianapolis, Ind., well-known makers of motor vehicle bodies, has brought out a new design for the Ford chassis. The new type is termed the convertible farm and stock body, and

Illustrating the New Parry Convertible Farm and Stock Body.

as shown by the accompanying illustration, can be utilized for a large number of purposes.

The design combines the advantages of both the platform and express types of bodies and has a loading space of 70 inches long and 60 wide back of the driver's cab. The sides have 12-inch panels and chain end gate. The floor is constructed of grain proof material and is provided with iron strips. The removable stock racks are equipped with a rod both front and rear and hold the racks securely.

Protection for the driver is afforded by a cab having straight sides. The lower panel is of metal and a glass window is provided one either side. The Parry convertible farm and stock body comes with or without racks, weighs 500 pounds uncrated and is richly painted. The design will more nearly care for every hauling requirement than any other style of body. A similar design is being worked out for service on the Ford one-ton truck.

Trucks Supply Army's Meat.

Motor trucks continue to play an important part in the war. The French army, which consumes vast quantities of meat, is supplied by truck divisions each supplying 20,000 men. Each machine transports approximately 4,000 pounds of meat, and seven machines have averaged 218 tons of fresh meat the month or about one ton per day. Many of the cars are rebuilt Paris motor buses.

Scotch Building Trucks.

As an indication of the reduced imports of motor cars, only 234 complete cars and chassis were landed in Great Britain in November, 1916, as compared with 2,079 in the corresponding month of 1916; but the value of each machine imported in 1916 averaged $4,866, against $2,263 in 1915.

In Scotland the manufacturers are turning out commercial cars exclusively. It is expected that with improved facilities, new methods and larger factories many firms will be in a position to compete after the war in markets previously beyond their scope.

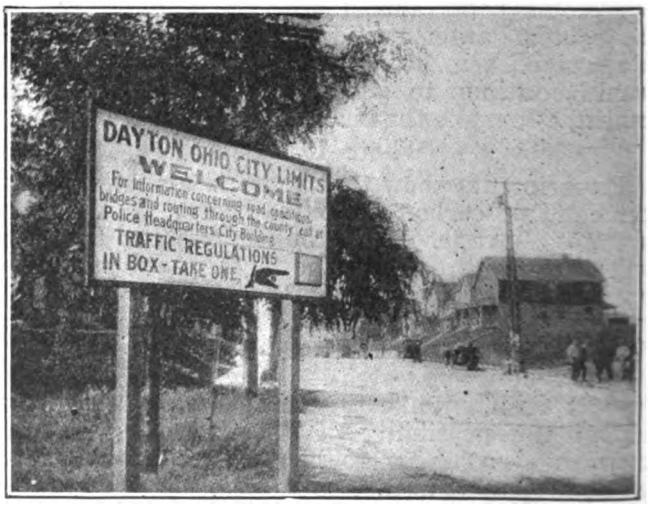
The Arrol-Johnson works have been engaged in government work; the Halley Industrial Motor Co. is producing motor trucks; and the Albion Motor Works have been making motors and accessories for the government, large extensions having been effected at their works.

Kerosene-Burning Tractor.

A concern in Ohio is to market a new type of two-wheeled tractor with a kerosene-burning engine of 35-horsepower and having a starter. The engine will be geared 93 to 1. A production of 2,000 machines is planned.

Priority for Tractors.

Tractors and other farm machinery is to have priority in transportation second only to war supplies, according to a recent ruling of the War Industries Board.



Novel Use of Signboard.

BY FELIX J. KOCH.

Farmers and those living at or in the vicinity of crossroads are frequently annoyed, and at all times, by travellers seeking information as to the roads. The use of a signboard does not always remedy the trouble, for generally the boards give but directions. Such information is not always that which the autoists, etc., desire.

The following suggestions are worthy of attention and are derived from a signboard in service on the outskirts of bustling little Dayton in south Ohio.

The farmer may erect an inexpensive guidepost, painting it white, to be most visible at night. To the post he can attach some old metal can, anything with a waterproof lid. Over that mount a placard: "Help yourself to road-directions inside." Then, next time in town, for perhaps a dollar, one can have some printer strike off several hundreds of the

Illustrating Novel Use of Signboard in Outskirts of Dayton, O.

cheapest leaflets, giving all information as to either road.

On the back of the leaflet might be put the farmer's advertisements, his price for varied products, bringing business.

New Cars and Accessories to be Revealed at the Chicago Show

The next great event in automobile circles will be the Chicago automobile show, which occurs January 26 to February 2, and there is every reason to believe that this national show will keep pace with the New York event, if not excel it.

In many respects the Chicago show is held to be more important than the New York event. Geographically, Chicago is more of a national center than New York, as it is now more of a center of sales for both motor vehicles and accessories.

The exposition, which will be managed by Samuel A. Miles, of the National Automobile Chamber of Commerce, has always exceeded all predictions as to business transacted and attendance, and the 1918 event will be conducted on that same liberal and wide-awake scale which has made Chicago famous.

The Chicago show enjoys an enviable reputation among manufacturers, as it attracts a much greater number of dealers and other trade men than does New York. Another feature of the Chicago event will be the first public display of the products of a number of car makers and manufacturers of accessories and equipment.

Every bit of space has been contracted for and both the Coliseum and the First Regiment Armory will be taxed to care for the large number of exhibits. This will be the last show to be conducted under the present conditions, as plans are being consummated whereby the available space will be greatly increased.

Country Needs Engineers.

The Army and Navy staff departments continue to demand men of engineering experience, especially in industrial lines. At present the outlook is that this demand will continue throughout the period of the war.

In calling attention to this, the United States Public Service Reserve, Washington, D. C. (where records of men willing to serve when called will be kept on file), points out that a man of engineering experience has a rare combination of opportunities open to him, which are not open to the average patriotic American, as follows: 1. To serve the country in his most effective capacity. 2. To keep in touch with his own profession, with the result that his patriotic service will not have caused him to become rusty by the time peace returns. 3. To become a commissioned officer and receive much better pay than the average man who has wholly subordinated personal interests and now works for the national good. 4. To perform his service usually without leaving the United States.

Electrically Heated Gloves.

Owners of cars equipped with electric lighting might profit by the experience of the Fiat testers and obtain a heating arrangement at practically no cost. These men are called upon to test cars at extremes of temperature, and as test chassis cannot be fitted with windshields, the problem of keeping warm on Alpine roads is one of no small order.

The Fiat testers are now supplied with electrically heated gloves, obtaining current from the lighting system on the car. The gloves have resistance wires set in the back, between two layers of thin sheet asbestos. Connection is made to the electric light terminals at the most convenient points, and the fine flexible wires attached to the wrist of the gloves by pressure buttons.

The wires are of sufficient length and are sufficiently flexible not to interfere in any way with driving, and the current passing through the resistance keeps the hands at a warm temperature on the coldest days. If it is necessary to leave the wheel, the wires can be disconnected from the gloves merely by a pull on the push button connections.

While the Fiat drivers use this system of heating for the hands only, there is no reason why it should not be applied to the waistcoat and boots; indeed, in the aviation service of some of the Allied forces electric heating for all the clothing has already been adopted. Most motorists, probably, would be satisfied with heated gloves only, and by the method described can obtain these readily and cheaply.

COMING EVENTS.

Milwaukee, Wis., January 18-24.—Show, Milwaukee Auto Trades, Inc.

Detroit, Mich., January 19-26.—Show, Detroit Automobile Dealers' Association.

Montreal, Can., January 19-26.—National Motor Show of Eastern Canada, Montreal Automobile Trade Association.

Cleveland, O., January 19-27.—Show, Automobile Show Co.

York, Pa., January 21-26.—Automobile Show, the York Auto Dealers' Association.

Scranton, Pa., January 21-26.—Show, Scranton Motor Trades Association.

Portland, Ore., January 21-26.—Show, Motor Car Dealers' Association.

Mifflintown, Pa., January 22-26.—Show, Automobile Trades Association.

Allentown, Pa., January 23-28.—Show, Lehigh Auto Trades Association.

Harrisburg, Pa., January 26-February 2.—Show, Capital City Motor Dealers' Association.

Chicago, Ill., January 26-February 2.—National Automobile Show, National Automobile Chamber of Commerce and Motor & Accessory Manufacturers.

Minneapolis, Minn., February 2-9.—Show, Minneapolis Auto Trades Association.

Kansas City, Mo., February 9-16.—Show, Kansas City Motor Car Dealers' Association.

Bronx, New York City, February 9-16.—Show, Bronx Automobile Dealers' Association.

St. Louis, Mo., February 11-16.—Show, St. Louis Automobile Manufacturers' & Dealers' Association.

Kansas City, Mo., February 11-16.—Third Annual Tractor Show, Kansas City Tractor Club.

Newark, N. J., February 16-23.—Show, N. J. Auto Exhibition Co.

San Francisco, Cal., February 16-24.—Second annual Pacific automobile show, Motor Car Dealers' Association of San Francisco.

Waterbury, Conn., February 18-23.—Show, United Shows Co.

Springfield, Ohio, February 18-23.—Show, Springfield Auto Trade Association.

Syracuse, N. Y.—February 18-23.—Show, Syracuse Automobile Dealers' Association.

Pittsfield, Mass., February 18-23.—Show, State Guard.

Grand Rapids, Mich., February 18-23.—Show, Automobile Business Association.

Des Moines, Iowa, February 18-23.—Show, Des Moines Automobile Dealers' Association.

Brooklyn, N. Y., February 22-March 9.—Show, Brooklyn Motor Vehicle Dealers' Association.

Omaha, Neb., February 23-March 2.—Show, Omaha Auto Trades Association.

Columbus, O., February 27-28.—Show, Columbus Auto Show Co.

Muskegon, Mich., February 25-March 2.—Second annual show.

Boston, Mass., March 2-9.—Automobile Show, Boston Automobile Dealers' Association.

Great Falls, Mont., March 16-20.—Second annual show, Montana Automobile Distributors' Association.

San Francisco, Cal., March 19-24.—Show, Motor Truck Dealers of San Francisco.

Trenton, N. J., March 20-23.—Show, Trenton Auto Trade Association.

Stockton, Cal., April 9-13.—Show, San Joaquin Auto Trades Association.

Digitized by Google

Accessory Exhibits Divide Honors With Cars at New York Show

Despite the fact that the New York show was a war-time show and the attendance of the younger element was noticeable for its absence, it will go on record as the biggest accessory show ever held under the auspices of the N. A. C. C. All told, 331 different manufacturers of accessories had their product on exhibition, as against 323 at the previous show. Those who have attended the shows for several years past noted the absence of several exhibitors and products which have been prominent in previous years. The representation of tire manufacturers was very small and several makers of ignition specialties, fuel tanks, engines, bearings, axles, etc., were missing.

Small Wares Noticeable.

An analysis of the exhibits shown on the two floors revealed the fact that the majority of accessory concerns displayed what may be termed small wares. Here and there could be seen the displays of makers of heavy garage equipment, such as arbor presses, etc., but these were in the minority. Although the oxy-acetylene welding process has made great strides in the automobile industry, but one maker displayed welding and decarbonizing equipment.

As has been previously stated, the tendency was toward the exploitation of small material, equipment that may be termed standard. The fact that the dealers appeared to be more interested in those accessories appealing to the owner of the used car, and in devices bringing an older model more up to date, would indicate that one of the effects of the war is to greatly increase the demand for practical accessories and equipment.

Dealers and Repairmen.

One of the features of the show was that the accessory display attracted an unusually large number of dealers and repairmen, particularly the latter. Interest appeared to center in time and labor-saving devices, tools making readily accessible those components of the chassis not easily reached with ordinary tools. Indicative of the economical trend was the careful inspection of piston rings and fuel-saving devices. That the manufacture of piston rings is being given the attention it deserves is indicated by the display of a patent ring by one of the largest and best known makers of ignition apparatus. Despite the reported shortage of material, the number of new accessories exceeded that of the previous show. The presence of a large number of jobbers shows that the dealer and repairman are dominating influences in the automobile industry today.

New Era "Moto Nose."

Several new specialties were shown by the New Era Spring & Specialty Co., Grand Rapids, Mich., of which Smalley Daniels is president. Among the new articles was the "Moto Nose" (air breather) for Ford cars. This is a practical device and one that should appeal to Ford owners in that it prevents the water in the cooling system from overheating under the most severe conditions of service. The principle of the "Moto Nose" is that of the ship funnel method of ventilation. The device is screwed into the filler tube of the radiator, replacing the radiator cap. When the car is in motion a stream of cool air is directed through the "Moto Nose," over the surface of the water and at its hottest point, the top of the radiator. A screen prevents the entrance of foreign elements. The "Moto Nose" is neat and substantial and comes finished in either nickel or black enamel. Is moderately priced.

Another New Era specialty is the interchangeable spring bumper which is sold with a permanent guarantee. The double front bar affords maximum strength, is of highly tempered steel, and has attaching arms of semi-tempered material that will bend when subjected to severe shock. One of the several practical features of the bumper is that a drum-like rebound is obtained by the double bar being tied in the center so that both bars act simultaneously. The interchangeable feature, one that adapts the bumper to 93 per cent. of the cars, is shown in an accompanying drawing. These are the ratchet type of attachment shown at A, B and C and the hook-on type shown at D and E. The double front bar interchanges on these types, also with three-quarter and with all special fittings. The New Era Spring bumpers are supplied in black and black with nickel front bar.

The New Era "Korect" rear tire carrier for Ford cars is designed to carry Ford casings with or without demountable rims, also Firestone special rims. Carriers for wire wheels are also supplied. The tire carrier is attached directly to the chassis as shown, and as there are no holes to drill it can be installed by the owner. Steel is used throughout and the carrier is sufficiently strong to support a heavy person. It is rigid and free from noise or rattles. This design not only properly supports the tire but locks it and the rim, thus preventing theft. Although made to carry one tire it can be converted into a double carrier in a few minutes by the addition of extra parts. The material and workmanship are first class in every respect.

Petry Ventilator.

The N. A. Petry Co., Inc., 1307 Race street, Philadelphia, Pa., showed in addition to their regular line the Petry ventilator for Ford cars. This is a practical construction that should appeal to the owners of the Ford in that it permits of regulating the temperature of the driver's compartment. As may be noted by the accompanying illustration, the Petry ventilator throws or directs the currents of air on the floor of the driver's compartment and not on the passengers. The ventilator is so constructed that rattles are avoided and throughout the construction is sturdy. The device can be easily installed on the cowl of the car and the finish is in keeping with the high grade maintained by the company. The ventilator is rain and dust proof. The Petry cut-out and Petry universal pedal were also shown by this company.

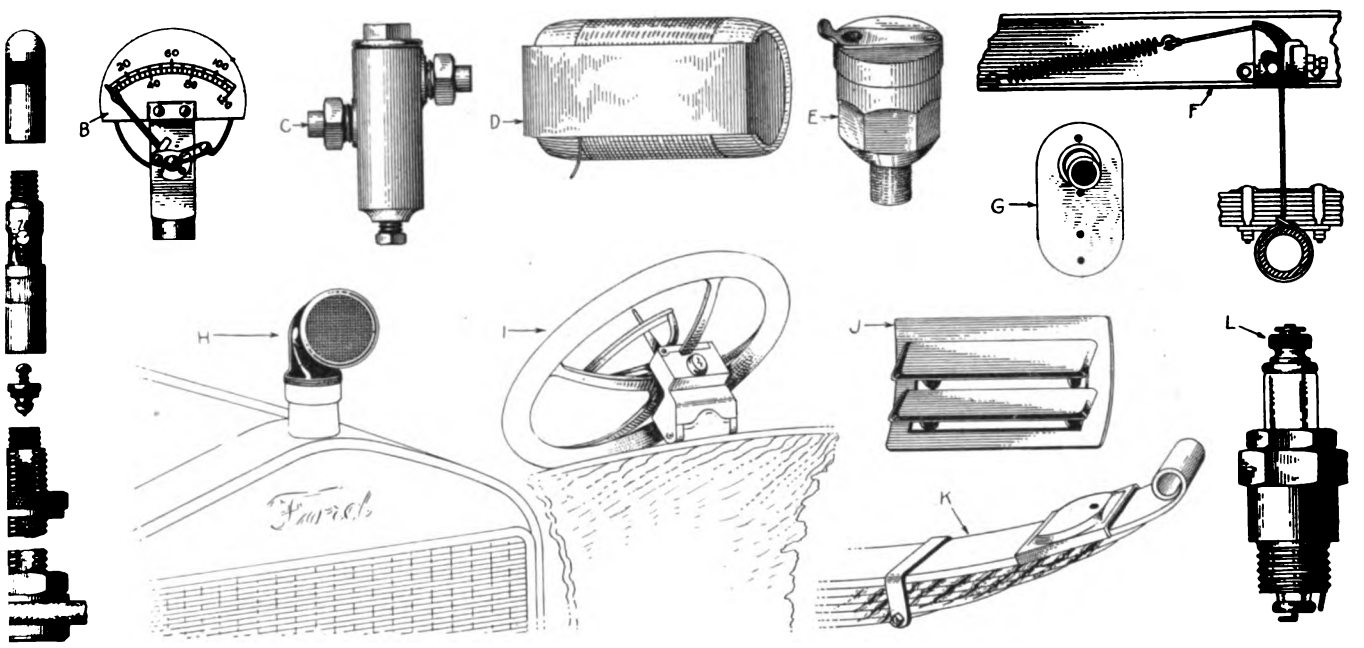
Cig-R-Lite.



One of the new electrical devices displayed was ıe Cig-R-Lite, an electrical device for lighting a gar or cigarette when the driver or other passen-ɜr desires a smoke. One of the several interesting ıatures of the lighter is that when it is withdrawn ɔm its receptacle, the electrical circuit is auto-ıatically completed. The wire coils in the tip of .e lighter immediately become red hot, enabling ghting of the cigar under all weather conditions. coiled spring rewinds the flexible cord and the ghter returns to its receptacle, automatically break-g the circuit or extinguishing the light. The lighter made for six or 12-volt circuits and consumes very tle current. It is made in several types, flush for ɜtrument board, for cowl dash, smoker's case, cket, etc. That illustrated is the flush type and but 2⅛ by 3¾ inches. The device is nicely fin-ıed and moderately priced. It is manufactured

Pressurite.

The Improved Gauge Mfg. Co., 302 West Water street, Syracuse, N. Y., maker of Pressurite gauges, displayed several forms, these including a tire tester, control indicator, tube indicator, etc. Accuracy and durability are features emphasized of the products of this company, which also produces spring oilers. The Pressurite gauges are constructed entirely of metal, and all bearings are of non-corrosive German silver. They are held to be accurate to within two per cent., the error allowed by the United States Government specifications. The accompanying illustration shows the working parts of the gauge and its simplicity is noticeable. Accuracy is due to the use of the Borden tube. The company issues an interesting booklet describing its products.

Twin Fire Spark Plug.

A spark plug that attracted considerable attention because it would continue to supply a spark after

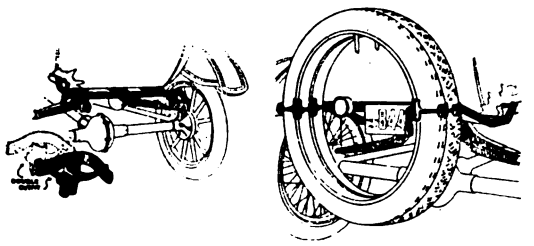
G. W. L. Automatic Spring Oilers.

ɔoper lubrication of the bearing surfaces of the ıgs not only prevents breakage, saves the tires makes the car ride easier, but eliminates annoy-squeaks. To provide proper lubrication of the gs the Auto Specialty Sales Co., 47 West street, York City, has brought out the G. W. L. auto-ɜ spring oilers, which consist of a light, neat, ɔroof metal holder containing a felt pad. The l case has an oil reservoir, and the lubricant is d to the bearing surfaces or between the leaves e springs that a thin film of oil is deposited ntire length of the spring. The lubricant is ied automatically; that is, it is fed only when ar is in motion. The G. W. L. oiler is placed ther end of the spring. It snaps easily over ɔring and requires no tools to install it. It is oticeable when attached and is very compact.



the demonstrator short-circuited one of the gaps, was the Twin Fire plug, so named because two sparks are provided. This plug fires two sparks in series, and the maker states that one point will fire even when the second is fouled with oil, carbon, etc. It is also claimed that the explosions of the mixture will clean the fouled point. The Twin Fire plug is constructed in the conventional manner with the exception that an intermediate electrode is employed and two gaps are used. The number 1 gap, so-called, is set at .015 inch, and the number 2 at about .020. The Twin Fire plug is made in standard ½-inch, ⅞-18 regular and ⅞ extension sizes as well as metric. The maker claims that a greater volume of gas will be ignited by the plug and that soot or oil will not prevent its successful operation.

Common Sense Shock Absorber.

A new and novel type of shock absorber, one that is easily and quickly installed, was shown by the Common Sense Mfg. Co., Runyon street and Sher-

Digitized by Google

man avenue, Newark, N. J. The Common Sense shock absorber is attached to the inside of the channel of the chassis frame, where it is concealed from view as well as not affected by water, mud, etc. It consists of a spring secured to the frame by means of a bolt, a strap and a triangle. The last named is bolted some 14 inches from the shock absorber

The New Era "Korect" Rear Tire Carrier for Ford Cars.

proper. The strap is attached to the spring by means of an eyelet. The proper tension of the device is obtained by means of a setscrew having a lock nut. The construction of the shock absorber is such that the reflex action or recoil of the car spring is controlled or checked. The device permits of free downward movement of the spring. The Common Sense shock absorber is made in two types, for light and medium weight cars and heavy machines.

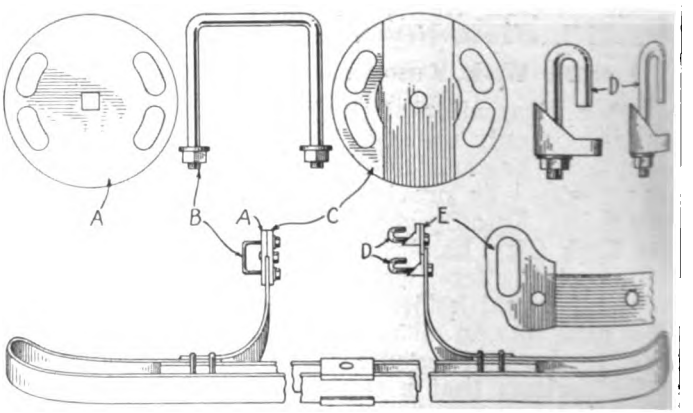
Husted Auto Lock.

A lock for preventing theft of the car in that the steering wheel is so locked that it cannot be turned, was displayed by Asch & Co., Inc., 24 West 61st street, New York City, distributors for the maker, the Husted Mfg. Co. Youngstown, O. One of the features of the construction is that there are no holes to drill in attaching nor are there places where leverage can be obtained for displacing the device. The lock is pivotally mounted on the steering column and is so made that its two sections meet and enclose the spoke of the steering wheel. When locked in position the device practically obtains a solid construction, one that the makers claim will defy the most clever thief. No two locks are alike. The lock is made of high-grade steel, all bolts are enclosed and the finish is nickel. A key is used only to unlock the device.

Lubrik-Oil Cup.

An oil cup supplying lubricant to the bearing surfaces of a motor car, etc., has been brought out by the Warnola Mfg. Co., 73 Wooster street, New York City. It is designed to replace the conventional grease cup and is made for both vertical and horizontal positions, such as for a shaft and spring shackle bolts. The method of conveying the oil from the source of supply to the bearing surface is novel in that a steel ball contacts with an oil wick and carries the oil to a standpipe. This pipe communicates with the bearing surface. The ball is set in motion by the movement of the car, and the amount of oil fed is regulated by the size of the ball, speed of the car, etc. The supply is by means of a felt wick, and capillary attraction carries the oil up the wick to the point where contact is made by the ball. One of the features of the cup is that it has a dirt-proof filler opening. Any dirt in the lubricant settles to the bottom. It is stated that one supply of oil will serve a car for 3,000 miles. Standard as well as special sizes are supplied, also different finishes.

Armstrong Tube and Valve.



Maintaining the proper or original pressure and avoiding the possibility of over-inflation of a tire are among the novel features of the new Kahn automatic safety valve used as standard equipment with the Armstrong inner tubes, made by the Armstrong Rubber Co., Inc., 122 Adams street, Newark, N. J. These tubes are extra heavy, are laminated, and eliminate the usual spreader iron and patch. Because of these features the maker claims that running with a flat tire will not damage the tube. The valve, which can be set for any desired pressure, eliminates the use of a pressure gauge, and if the valve be set at 70 pounds the gauge will blow off if more air is used. The maker claims that a superheat steam type of packing or washer absolutely avoids the possibility of leakage. No extra dust cap is required with the Armstrong cap, which can be pulled through the felloe of a wheel when changing demountable rims, thus making removal of the cap unnecessary.

Ajax Wire Assortment.

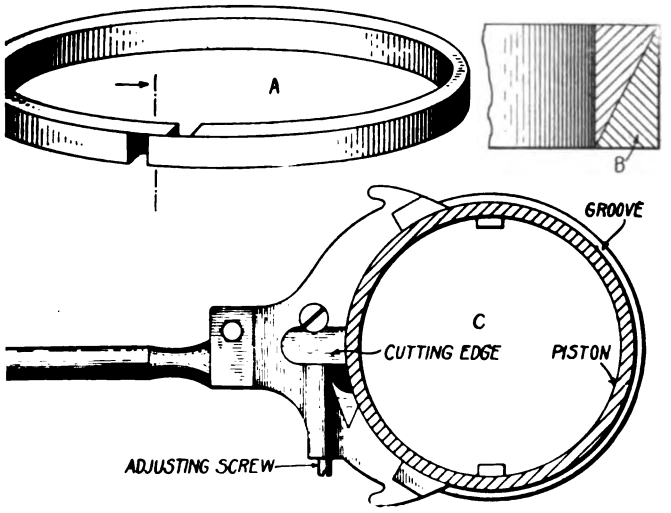
Annealed or flexible wire is exceedingly useful in the garage and repair shop. When stored in ordinary coils the wire tangles and kinks. To prevent these troubles the Russell Fraser Wire Co., 70 North 9th street, Brooklyn, N. Y., is marketing its wire wound on spools, and the wire cannot unravel because of the use of a patented metal clip attached to the spool. Another feature of the spool and clip is the use of a tension spring which keeps the wire close to the spool as the wire unwinds. This makes for economy and convenience. The wire is a soft, pliable galvanized steel, and Ajax wire is put up in four salable sizes on one size of spool. The number of feet per spool is printed on the holder. The company is marketing the Ajax wire assortment consisting of 72 spools of four sizes, 16, 18, 20 and 22 iron wire gauge. This assortment comes in a neat wooden container and forms an effective silent salesman.

Sasco Fuel Strainer.

Much of the trouble experienced with engines is due to the accumulation of dirt and other foreign

The Interchangeable New Era Spring Bumper.

matter in the float chamber of the carburetor. The presence of foreign deposits can be prevented by the use of a strainer, and when the fuel system does not include one, one should be installed. A



Digitized by Google

strainer that is not only very light, but adapted to motorcycles, motor boats, automobiles and other internal combustion engines, is the Sasco made by Sage Bros. Inc., 780 Union street, Brooklyn, N. Y. It is so made that should two-thirds of its basket mesh become filled with dirt, etc., the flow of the fuel will not be restricted. The foreign matters can be easily and quickly displaced by a few turns of the ground joint top cap, which when removed affords access to the strainer basket. The reservoir for trapping the water in the fuel is well arranged. The Sasco strainer comes with ground joint couplings to fit 3/16, ¼, 5/16 and ⅜-inch tubing, outside diameter. The material used is aluminum.

Munger Piston Rings.

One of the features of the exhibit of the Splitdorf Electrical Co., Newark, N. J., well-known makers of ignition and electrical apparatus, was the display of the Munger "Always Tight" piston rings, a new design and one that proved interesting to the dealer and repairman in that a regrooving tool is supplied with every set or carton of rings.

This tool is shown in an accompanying illustration and is designed to eliminate the need of dis-

e Munger Piston Ring: A, the Ring; B, Showing the "Always Tight" Feature; C, the Adjustable Regrooving Tool. A Ring Insertion Tool is Included.

acing a piston from the connecting rod when new ngs are to be fitted. Instead of placing the piston a lathe to true up the grooves and reducing the ng to obtain the proper fit, all of this work is acmplished by the Munger regrooving tool. Inasich as the tool is adjustable, the ring grooves can trued to receive oversize rings as well as irregurities removed. The construction of the tool is ch that its use does not require experience with ting rings, etc., and the maker claims that a vice can true up grooves and properly fit rings.

A One-Piece Construction.

The Munger ring is a one-piece ring; that is, it made of a single piece of metal, and its joint is a ible cut so made that even when the ring exnds it remains gas-tight. It is of the concentric pe, a design the outside and inside surfaces of ich obtain two perfect circles and walls of uniform ckness even after the ring has been in service some time. It is also pointed out that a patted process of peening enables the ring to fit perfectly the cylinder walls as well as insures an even pressure.

The surfaces of the Munger ring coming in contact with the cylinder walls are not polished, but are finished with minute grooves. These enable the ring to seat itself quickly and to adapt itself to all points of the cylinder walls through the yielding of the grooved surfaces.

Insertion Tool Supplied.

In addition to the regrooving tool there is supplied the Munger ring insertion tool, which simplifies the installation of a piston ring. With this tool a ring can be put on in a few seconds. The complete equipment consists of eight rings of regular size and four oversize in addition to the tools described. This combination of rings is supplied because of the difference in wear of the ring grooves. For the present the Munger "Always Tight" ring equipment is being marketed for the Ford engines, but it is understood that rings will be produced for other makes of cars.

The equipment comes packed in a neat carton, and one of the features of the rings is that they are made rust-proof by the Parker process. The Splitdorf Electrical Co. issues a comprehensive booklet on fitting rings, etc., and which describes the advantages of the Munger ring.

AMONG MASSACHUSETTS GARAGES.

How a Novel Test Was Made of Faulty Coil With a Telephone.

BY JAMES F. HOBART, M. E.

"My spark coil is N. G.," said a man recently who had been driving a car over Massachusetts hills. "I can't get a kick out of it. Will you see what is the matter with it?"

The car was deep among the Massachusetts hills, with no garage or repair shop within several miles. The house of the car owner was close by and thence was taken the defective spark coil and the battery.

No buzz could be obtained at the contact breaker when the various wires leading from the instrument were connected. By bringing the battery wires to the buzzer and touching piece after piece it was found that a very slight spark could be obtained almost anywhere, but no steady buzz of the vibrator could be obtained. The wires were carefully examined for breaks or for poor connections, but were found to be in perfect condition.

Testing Cells with a Spark Coil.

A battery tester was not at hand but each cell was tested separately by attaching them, one at a time, to the terminals of a wipe spark coil and then attaching one wire from the coil to a bastard cut file. The other wire from the battery was drawn across the file whereupon a shower of sparks showed approximately the condition of the cell.

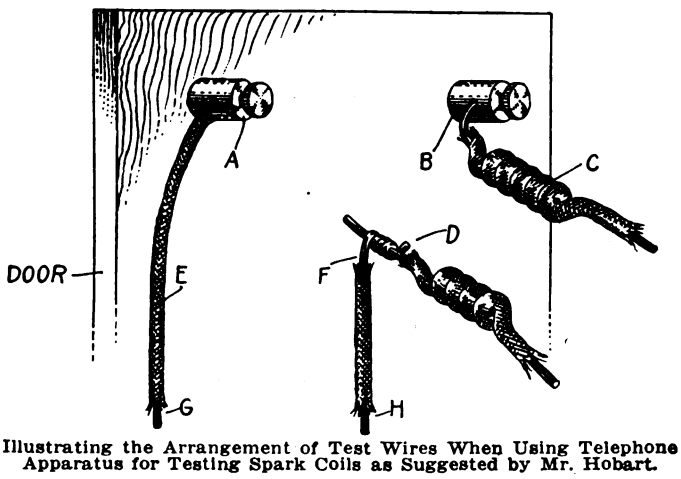
After each cell had been tested they were connected in series and tests made after each addition of a cell. It was found that the sparking increased constantly and regularly, showing that each cell was in good order even though its exact voltage was unknown. This test avoided use of a dead cell.

But each cell proving to be in fair condition, and nothing being discovered wrong with the coil, it was determined to make a magneto test of the coil and

Digitized by Google

to use the "Granger" telephone in the house of the man who owned the coil under examination.

But here a snag was encountered. "You must not touch the telephone. There would be all kinds of trouble should you use it for testing the automobile and they might take out the instrument. Then we would be in big trouble!"



Using the Phone.

After repeated assurances that what they did not know would not hurt the feelings of the telephone company, a reluctant assent was given and the 'phone was pressed into service.

Tracing the main wires into the telephone box, the wires in question were quietly disconnected at their binding posts and so placed that durng the test the ends of the detached wires could not come in contact with each other. This action simply cut the 'phone from the main wires without disturbing any other instrument on the line, just as a single incandescent lamp may be taken out of circuit without disturbing the remainder of the lighting service. Had the two disconnected wires chanced to touch each other then the resulting short circuit would have caused trouble on the line.

Arranging Test Wires.

The little box upon which the magneto bells are located was then opened. Some boxes are locked but

Illustrating the Arrangement of Test Wires When Using Telephone Apparatus for Testing Spark Coils as Suggested by Mr. Hobart.

the lock may be easily picked by means of a bit of crooked wire. This box was not locked. A round head screw held it closed and a small screwdriver soon opened it. On the back of the door were several binding posts, two of which are shown at A and B in an accompanying illustration. When the receiver was in place upon its hook and wires C and D in place in posts B and A respectively, the bells would ring when the crank was turned. One of the wires was removed as at D, and the bell would not ring when the crank was turned. A couple of the battery wires having been disconnected for the purpose of testing as described were then connected as shown at E and F.

Wire E was slipped into binding post A and fastened there by means of the binding post screw. Wire F was attached directly to wire D by twisting together the ends of the two wires. By turning the magneto crank and touching together the ends of the wires G and H, the magneto bell of the telephone would ring and the ends G H were used in making the tests at the spark coil terminals.

It is to be understood that the telephone was not removed from its position upon the wall while the coil was being tested. The wires G and H were long enough to permit of their being brought in contact with the coil while that instrument was lying on a chair near the telephone.

In making the test wires G and H were touched to the two primary coil terminals and of course the bell would ring through the primary coil when the crank was turned. One of the wires was kept in contact with a primary and the other wire was placed in contact with the wire leading from the secondary coil and the bell rang through the secondary coil also.

This test showed that the coils, windings, both primary and secondary, were unbroken. In this coil one end of the secondary was attached to the primary thus connecting them together.

A match was then placed in the vibrator in such a manner that connection between the spring and its platinum point, upon which it rested when current was off, was prevented. A test was then made with the two primary (battery or magneto wires) connected as in the first test. The placing of the match should have broken the primary circuit but it didn't in this case, and the bell rang as before!

Here was trouble. With one wire (G) made fast to one of the three wires which entered the coil, wire H was touched successively to each bit of brass in the vibrating mechanism, and no form of contact could be found in which the bell would not ring strongly. This was tried with the other two wires, one after the other, and the bell rang freely.

This meant that something was decidedly wrong inside of the coil, that the two windings were evidently short-circuited and that the coil had best be sent back to its maker for repair.

And this you should always do, brother mechanics, automobile owners and drivers. You may test out the coils as fully as you choose, in the above described manner or in any other way as long as you do not use the electric lighting current for test purposes, and sometimes even that will not harm the coils, but it might burn out some of the fuses in your lighting circuits unless proper precautions were taken by putting a lamp in series with the test wires.

A mechanic to whom the story of testing out a spark coil with a telephone magneto had been told said that he had for a long time wanted a magneto for frequent testing but had not been able to get hold of one, but that he intended to cut in a double pole snap switch, same as is used for lighting purposes.

This man said he was going to connect one of these switches into the magneto circuit of his telephone in such a manner that by simply giving the switch a half turn he would be able to cut the magneto into a permanent testing service without interfering in the least with the telephone or with the calling of the central office. Then whenever he wanted to call "Central" it would only be necessary to give the switch another half-turn and the 'phone would be again ready for its legitimate use.

Better look out, though, before you try this scheme, and see that you have a magneto connected with your telephone, for some systems do not use magnetos. They use what is known as "Central Energy" for calling and it is only necessary to remove the receiver from the hook in order to call Central. You can't use the magneto for a testing instrument with this kind of telephone system.

Care of Tires in Storage.

Suggestions for proper preparation of tire and tubes which are to be stored during the winter months are made by Frank C. Millhoff, general sales manager of the Miller Rubber Co., Akron, O. "Those who do store their cars should take at least one precaution," says Mr. Millhoff, "and that is remove each tire.

"Next I would cleanse the outside of the casings with ordinary soap and water. The object in this is to remove all traces of oil which, as is well known, operates detrimentally to the life of the tire. Then I would examine both the inside and the outside for bruises or injuries; make what repairs were needed and finally wrap the tire carefully in a clean cloth—or preferably black paper—and lay it flat in a cool dark room. The inner tube should not be neglected. A leaky, faulty tube simply shortens the life of the tire by thousands of miles.

"I would not allow a tube to remain in the casing, no matter how good or how poor it was. I would carefully clean off each one, then lay it flat in a cool dark place as in the case of the tires. A cool dark place is recommended because the actinic rays of light are injurious to rubber.

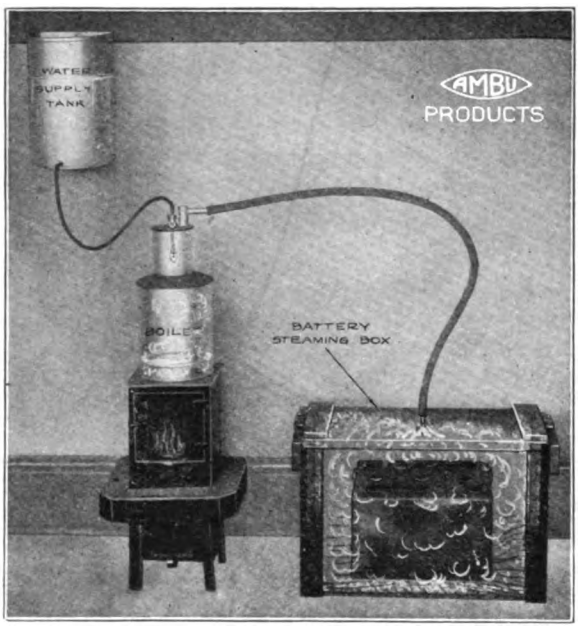
"If I did not want to remove the tires, the very least I should do, would be to jack up the car enough to take the weight off the tires and leave just enough air in them to keep them tight and in shape. The spirit of conservation calls for simple precautions as these, but from another standpoint—they are necessary if the motorist is to get out of his tires all that he can reasonably expect."

English Demand for Electric Vehicles.

It is probable that after the war there will be a favorable opportunity in England for the sale of electrically propelled vehicles. American manufacturers would do well to look to this field and be prepared when normal times return to get a fair share of the trade. In the past this type of car failed to obtain much popularity, but the scarcity and high price of gasoline and the difficulty of obtaining any of the ordinary liquid fuels have caused a change.

Many persons are convinced that the price of gasoline will remain high even after hostilities cease, and in fact may never again be as low as in prewar times. It is true that coal gas as a substitute for gasoline has been largely employed by many motorists, but for various reasons, especially on account of the space that it occupies, only a small proportion have adopted it as a way out of the gasoline difficulty. Already the use of electric commercial cars has begun to show an increase, although they are difficult to obtain under present conditions.

When the war is over it is thought that there will be a large demand for the electric car. Several municipalities have been experimenting with heavy electric vehicles and obtained satisfactory results. They have been found to be especially suitable for such work as town scavenging.



A heavy car which runs between the towns of Smethwick, Dudley and Kidderminster in the Birmingham district is supplied with electrical energy at a low cost. Birmingham is well situated from an electric vehicle point of view. Not only is current cheap, but within a 50-mile radius of the city there are 22 charging stations, apart from the seven stations within the city.

Peers Ambu Battery Steamer.

The American Bureau of Engineering, Inc., 1028 South Wabash avenue, Chicago, Ill., maker of the well known Ambu Electric Trouble Shooter, is introducing a new article termed the Peers Ambu battery steamer. It is an apparatus for softening the sealing compound on starting and lighting batteries by means of steam, so that the battery may be easily and quickly opened and without the use of a gas flame or blow torch.

The use of the apparatus avoids the possibility of damage and insures a clean, quick job in removing the sealing compound. It consists of only three parts, the steam generator, a steaming box and a water supply tank.

When a battery is to be opened, it is placed in the steaming box and steam passed into the box for about 15 minutes. This makes the sealing compound so soft that it can be removed readily. The steam generator or boiler is made of heavy galvanized iron. The amount of water in the generator is so controlled that steam is quickly obtained. The level of the water is maintained constant as long as

The Peers Ambu Battery Steamer for Softening Sealing Compound.

the supply in the tank lasts, and a continuous supply of steam is available in several minutes after the heat is applied to the bottom of the generator. For the average repair shop, the supply tank need be filled but once a day, and the entire apparatus requires absolutely no attention after the gas, oil or gasoline stove is lighted.

The supply tank is also made of galvanized iron and is connected to the generator by means of a small hose. It is placed a foot or two higher than the generator so that the water will flow into the latter by gravity. The steaming box is an acid-proof wooden member. Steam is introduced by means of a hose.

One of the features of the Peers Ambu battery steamer is that old covers, jars or battery boxes may be placed in the steaming box and the compound easily removed with a putty knife. A further advantage of the apparatus is that it loosens dirt, etc., making it a simple matter to clean the exterior of the box.

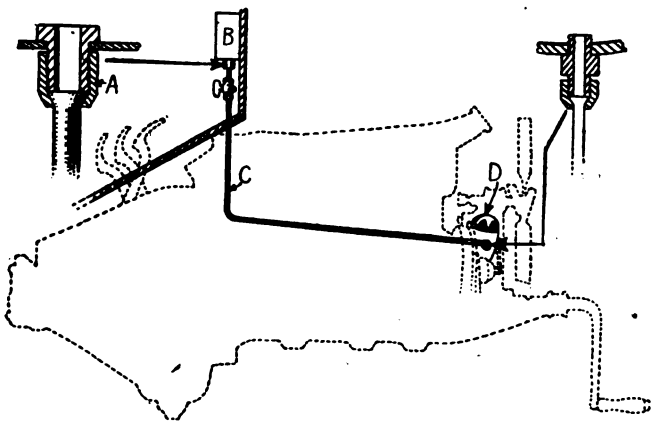
MAINTAINING OIL LEVEL.



Describing the Effect the Level of Lubricant Has on the Operation of Ford Engine.

An interesting account of a series of tests made by a writer in the Autocar appears in that publication. The tests were made after the writer noticed the operation of the engine with varying amounts of lubricant in the crankcase. The article is as follows:

Oil Gauge Indispensable.

"Before giving the results of these tests let me say that I consider an oil gauge indispensable on the Ford. We are told to keep the level midway between the two petcocks, but without a gauge you can only guess when it is at this level. Some people add oil according to mileage and measure the quantity they put in, but this again is unreliable, because the heat of the engine varies according to engine speed, weather, etc., and a very hot engine, of course, uses up more oil than a cool one. Therefore, I maintain that the only certain way of knowing the exact level is to employ a gauge.

"Before carrying out the first test the engine was

Showing Auxiliary Oil Tank and Bypass for Renewing the Supply of Lubricant in Crankcase.

decarbonized and the sparking plugs thoroughly cleaned. I then put in sufficient oil to fill the gauge three parts full, i.e., a quarter way below the top petcock, and started on a long run. The car altogether lacked "go," and never pulled really well until nearly home, when it began to improve slightly. The sparking plugs were found to be very dirty, and on removing the cylinder head there was a good deposit of carbon on the parts where it is usually found.

The Second Test.

"Starting again with a clean engine and plugs, the second test was begun with the oil level exactly halfway between the two petcocks. This certainly resulted in better running, but after a considerable number of miles I noticed that the engine gradually became more lively as in the long journeys previously mentioned. On examination, the plugs were found to be much cleaner, and there was less carbon deposit.

The Third Test.

"A third test was carried out with the oil level only three-eighths between the two petcocks, the engine and plugs having been cleaned as before. The engine was lively from the start, accelerated quickly, and romped up the hills. The plugs were practically clean, and there was scarcely any carbon deposit, even after some hundreds of miles, the oil level, of course, never being allowed to rise higher than three-eighths. These facts seem to point to this being the ideal level for obtaining the best results, but the question may rightly be asked whether there is not a great danger of running short of oil by starting out with so low a level. The answer is that it entirely depends on the driver. If he is a man who does not do anything to his car till it threatens to go no further (and unfortunately there are many such who handle Fords) there undoubtedly is; but if he is one who will take the trouble to look at the oil gauge a little oftener there is not. Naturally, oil will have to be added more frequently, but the improvement in running alone is well worth the extra trouble involved, to say nothing of the time, trouble and expense saved in not having to decarbonize so often.

Dashboard Oil Gauge.

"In order to be on the safe side, however, if this idea of keeping the level at three-eighths is carried out, I strongly recommend the fitting of a dashboard oil gauge, then the level can at all times be seen from the seat, and there is no fear of melting out the bearings. It also has the additional advantage of being free from the risk of breakage from flying stones, an advantage not enjoyed by the small gauges sometimes fitted in the place of the lower petcock. (By the way, the oil level must never be allowed to get below this lower petcock.)

Auxiliary Tank.

"I also recommend the fitting of an oil tank in some convenient place, say on the dashboard. This could be made for less than a dollar, and is well worth the outlay. A bypass, A, should be fixed in the bottom of the tank, B, with a tube, C, running from it, the other end of which should be introduced into the breather pipe. Then all you have to do when the gauge shows the level is getting low is to turn on the bypass till sufficient oil has flowed from the tank into the engine sump, when the bypass can be turned off again. It can easily be arranged so that this can be done from the seat and whilst the engine is still running—a great convenience. The car should be approximately on the flat when judging the quantity of oil showing in the gauge.

"Let me say in conclusion, lest anyone should think that other features contributed to the marked difference in the running of the car described in the article, that the adjustments of the carburetor and other parts were kept exactly the same during the different tests. Also, on several occasions when filling up in a hurry I have accidentally put too much oil in, and each time I have noticed the liveliness reappear when the oil has got down to the three-eighths level. I may add that the tests were made when gasoline was purer than it is today, therefore the results now obtained are not, of course, the same, but I think the proportionate improvement even now would be identical."

No Fuel Shortage.

According to the Petroleum War Service Committee, of which A. C. Bedford is Chairman, there is no shortage of gasoline for use in this country. As a matter of fact, as a result of the light de-

Digitized by Google

mestic demand incident to the winter weather, the stocks of gasoline are increasing and will further increase before the heavy summer demand is encountered.

While there is an increasing demand abroad for gasoline for use by our own army and navy, as well as by our Allies, the limiting factor there is shipping tonnage. All the gasoline is now being forwarded for which ships are available. Experience and inquiry make it clear that the petroleum industry in America can and will supply all the increased demand for oil products for the war, provided sufficient tank steamers can be obtained. It is estimated that in 1917 not over 25 per cent. of the gasoline produced in this country was exported. That fact should be reassuring to anyone who doubts this country's ability to supply the war requirements of our own and our allied governments for this important product.

FAVOR METAL WHEELS.

Warring Nations Discarding Wood for Both Passenger Cars and Trucks.

Wood wheels of all kinds have given such a poor account of themselves under war conditions that it is safe to assume they will cease to exist within a few years. Already wood has been eliminated from wheel construction of about 90 per cent. of European motor vehicles. It does not always follow that a design or type of construction which has proved superior under war conditions will be the best for peace conditions; but in this case the types of wheel which have proved superior in war undoubtedly will be retained after the war.

There are three main types of metal wheel in use at the present time: the wire spoke, the pressed steel, which may be either of the disc or spoke variety, and the cast steel wheel. For heavy loads—above two tons—the cast steel wheel is the only type used by European makers. There are practically no trucks of three, four or five tons capacity now built in England, France or Italy with wood wheels. Italian and French makers prefer the cast steel type. English manufacturers are rather divided between the cast and the disc types. The Fiat Co., which is the largest motor concern in Italy, decided on metal wheels as far back as 1903, and has adopted cast steel to the total exclusion of wood; in fact, this company never has built a commercial car with wood wheels.

There are two types in service, the hollow spoke wheel, which is a rather difficult foundry proposition, and the cast wheel with a transverse section in the spokes in the form of a cross. The advantages claimed of cast steel over wood are: Greater strength, immunity from climatic conditions, longer life, a slightly lower cost of production, a moderate saving in weight, and (this matter is of importance in the war zone) a greater factor of safety when under fire. Shell splinters which would seriously damage a wood wheel do little harm to a cast steel wheel. In case of a truck catching fire, wood wheels are certain to be destroyed, while cast steel wheels are practically unaffected.

A type of wheel which has been very much developed on the Continent since the war is the steel disc. It consists of the usual rim and a steel disc of uniform thickness stamped to the correct shape. The disc is forced into the rim and both electrically welded and cold riveted to this latter. Finally, two steel discs are riveted to the central portion of the wheel, and these three thicknesses of metal are drilled to receive the five, six or 10 studs by which the wheel is held in position.

This type of wheel is used on the one ton and 1½ ton trucks with dual pneumatic tires. Practically the entire Italian aviation service and a very considerable portion of the French aviation and ambulance services are equipped with the type of disc wheel. An attempt is being made to popularize the wheel for heavy touring cars requiring dual tires on the rear. As at present made, a set of steel disc wheels—single tires in front, duals in the rear—is rather heavier than a set of wood wheels with detachable rims. Also the fact that a complete wheel is carried as a reserve increases the total weight compared with wood wheels and detachable rims.

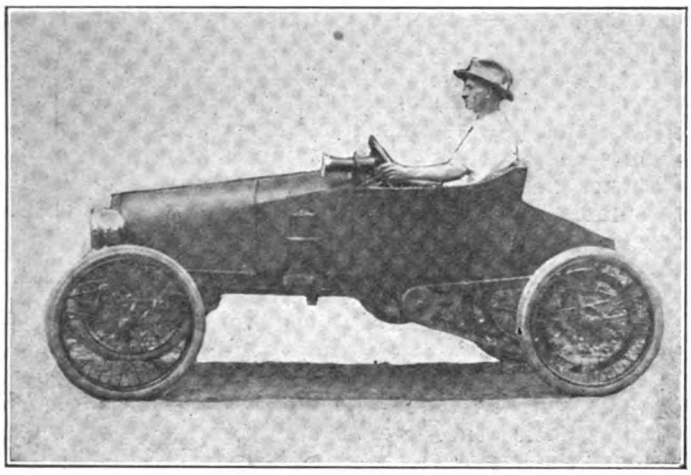
While it is predicted that the wood wheel is destined to disappear from ordinary touring cars, it is doubtful if it will be replaced by any one type. The Fiat Co., which is the only firm in the world using metal wheels throughout its series, from the smallest two-seater to the heaviest tractor, has for a long time employed detachable steel wheels for its ordinary touring models. This is a pressed steel type, but of the spoke variety, stamped in two halves and welded together. Naturally it is of the detachable type, has all the appearances of a wood wheel, but none of its disadvantages.

Up to the present, American makers have remained aloof from the metal wheel development. This is explained by the fact that the United States had a very good supply of second-growth hickory, and that wood wheels have been of better quality than those made in Europe. American military authorities are said to be impressed by the excellent results obtained by all types of metal wheels in Europe and are disposed to favor similar types for their army vehicles.

This Car Has Shower Bath.

An innovation that is meeting with favor in one of the ruined districts of France cared for by the American Red Cross is an automobile having in addition to a dispensary a shower bath. There are over 1,200 under-nourished, unsmiling little French children, many of them refugees from towns inside the firing lines, and some of these children have gone unwashed since winter. Skin diseases are frightfully prevalent. The construction and operation of the automobile shower bath is described as follows:

"On one side of the camionette is a seat large enough to accommodate a nurse and sick child. Over their heads is a rack for medicines and instrument bags, and opposite is a rack for gauze and bandages. On the floor is the shower-bath apparatus of jointed wood and rubber and shiny polished nickel to catch and entertain the children's eyes.



"Warm water is poured into a wooden tub, the child sits in the tub, and while the doctor pumps water through the shower the nurse scrubs. As the child whitens, the water blackens. At the finish, the rubber tube is suddenly shifted into a bucket of fresh cold water and the bath ends with an unexpected douse."

REBUILDING THE CAR.

How Two Owners Reconstructed and Improved Touring Cars.

Automobilists mechanically inclined frequently redesign or rebuild standard types of cars, incorporating in them individuality. The most favorite method appears to be that of converting a touring type into a roadster, and much originality is shown

Car Designed and Constructed by G. S. Williams and Having Friction Drive and No Differential.

by the owners. It sometimes happens that a standard chassis is not utilized, that the car is constructed entirely from parts by the owner.

Has No Differential.

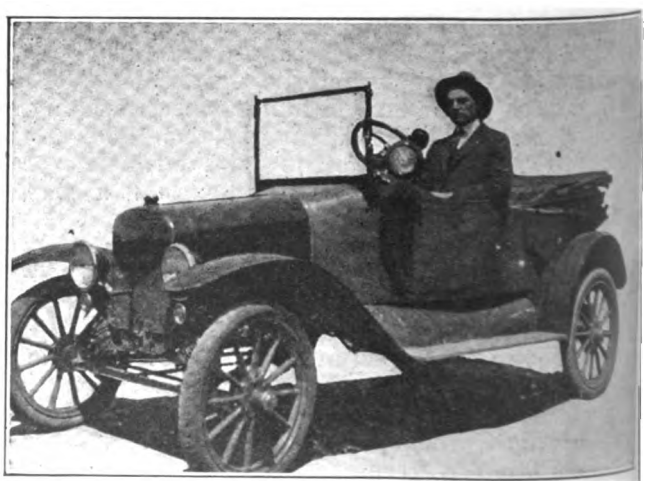
G. S. Williams of Tunnelton, West Virginia, sends us a photograph of a car he designed and built. The power plant is a 10-horsepower air-cooled engine taken from a cyclecar. The energy of the engine is transmitted through a friction drive, final drive being by two V belts. As may be noted by the accompanying illustration the driving pulleys are attached to a jackshaft which is essential with the friction type of drive. There is no differential used, the outer wheel on the curve is enabled to travel faster than the inner one through slippage of the belt on the small or driving pulleys. The tread of the car is 52 inches, tires 28x2½, and the machine has a speed of 35 miles per hour. The entire work of constructing and assembling was done by Mr. Williams.

Made Numerous Changes.

Guy Hustedde, Caruthersville, Missouri, is another reader of the Automobile Dealer & Repairer who has made a number of improvements to his car which was originally a 1914 Ford touring. He rebored the cylinders, installed oversize aluminum pistons, new connecting rods, Atwater-Kent ignition, Rayfield carburetor, hot air connections between the carburetor and exhaust manifold, shock absorbers, clover leaf body painted yellow, one-man top, rain vision windshield, fuel tank at rear of body, electric lighting and extra large hub caps.

Improves Appearance.

In addition to this equipment extra radius rods were attached and an ammeter to show the amount of current consumed as the source of current supply is a large capacity storage battery. To facilitate entrance and exit from the driver's seat a tilting type of steering wheel was installed, and an accelerator is part of the equipment. Mr. Hustedde states that the car has the appearance of one costing at least $1,200, rides comfortably, has more speed and consumes less fuel than before it was rebuilt. While no figures are given as to the cost of the equipment it is understood that it was not unreasonable.



CARE OF THE VARNISH.

When the new owner receives his first car with its beautiful luster, he then and there resolves to keep it in this perfect condition as long as possible. Such a resolve if conscientiously followed out will more than repay him for the additional labor which it involves, provided he adheres in his cleaning process to a method which will not injure the expensive varnish.

Practically, all bodies are finished with at least 18 coats of paint and varnish and some quite a number more. All this fine finish is put there by the manufacturer, not only for appearance sake but to protect the surface underneath from the disastrous effects of the elements. It is most certainly worthy of the greatest care which the motorist can bestow upon it, but from lack of knowledge such care frequently results in harm. It would raise the hair on the head of an ordinary coachman if he saw a man go over a car with hot water and a scrubbing brush as has been done in some instances. Such a procedure mars and dulls the varnish beyond any hope of repair without refinishing.

Use Clean Water.

In the first place one should possess two chamois skins and two flannel cloths, also a plentiful supply of cold, clean water. Rain water is preferred but should none be at hand, the ordinary city supply will do. Use a hose without a nozzle, and direct a gentle stream of water against the body, taking care to have it strike at an angle. The more gentle the stream and the longer time any mud accumulations are allowed to soak, the better, as a heavy flow will tend to drive the grit over the surface so rapidly as to cause scratches. If a hose is not avail-

able a garden watering can such as used to water flowers with will serve.

Take one of the flannel cloths and remove the accumulations of dust and mud as the water flows upon the body. Try to float the dirt accumulations

Digitized by Google

off as much as possible without rubbing the surface.

Keep separate chamois and cloth for the body and chassis, and always wash the car in the shade. In drying the body wipe it gently with the chamois and let a fine mist remain, as this will notably increase the luster. While there are undoubtedly good soaps on the market for use in washing cars, some do not recommend the continued use of same, except on the chassis. Kerosene should never be used. Plain cold water is the best thing for the varnish, and plenty of it, especially on a new car, as it hardens the finish.

First wash the hood, then the body, fenders, chassis and the wheels last. In washing the chassis, first remove all accumulations of grease or oil with gasoline or kerosene. A brush can be used to good advantage between the spokes. The varnish on the chassis will stand a much stronger stream of water without injury than that used on the body. Care should be taken in lubricating the car not to spill any on the varnish, as it is very detrimental to it.

Tar deposits may be removed with a small piece of rag moistened in turpentine. Do not allow mud spattered on the car to dry on, as it will spot the finish by extracting the oil, and wash off dust as soon as possible. If these directions are carefully followed, the car will retain its original luster for a long period, but when this becomes dulled a body polish will prove very beneficial.

Renting Popular in Manila.

Few Philippine imports have had so good a market during the last five or six years as that enjoyed by motor vehicles. With but two exceptions there has been an increase each year since 1911 in the number of automobiles imported. Motor trucks are classed as automobiles in the figures of the custom house. It is only within the last four years that tires have been segregated from other parts and supplies. There has been a good increase in the importation of supplies and parts, especially in tires. The total value of the tires imported during 1916 was nearly $500,000.

The figures available for the first six months of 1917 show a slight decrease in the total value of the automobiles, parts, and tires imported for that period compared with the first six months of 1916. The indications are, however, that the current year will show no falling off in the imports of automobiles over 1916, provided shipping conditions do not interfere.

At the close of 1916 there were in actual operation in the Philippine Islands 3,013 automobiles, 392 motor trucks and 870 motorcycles. Besides these there were 1,630 machines undergoing repairs or not in operation for some other reason. The greater part of the latter number were automobiles. Of the total number, 1,481 automobiles, 248 motor trucks and 323 motorcycles were being operated in the city of Manila.

Garages for the repairing of automobiles and other motor vehicles have multiplied greatly within the last few years, particularly in Manila, consequently comparatively fewer parts of machines are now imported. Many of the parts that frequently were imported from the factory are now manufactured locally in the repair shops. Considerable valuable repair shop machinery and tools have been imported within recent years.

The trend in the Philippine market has been toward small, lower-priced machines. Filipinos are the principal buyers, and they prefer light cars. Very few of the larger cars are now imported.

Most of the establishments that formerly kept horses for hire now maintain motor cars for rent by the hour. The prices charged vary from $1.50 to $5 the hour. The automobile operating from stands on the streets for hire has entirely driven off the horse vehicles formerly operated. These street cars are frequently owned by the drivers and have no overhead charges to pay such as machines operated from garages, etc., must pay.

Many dealers sell cars on the installment plan. A certain amount is required to be paid down and promissory notes given for the subsequent payments secured by mortgage on the machine. The machine is insured enough to cover the unpaid balance. This method is said to be satisfactory.

Solving the Fuel Problem.

In addition to plans for developing the fuel resources of Ireland, two steps that may have far-reaching effects upon the supply of home-produced motor fuel have just been taken by the British government. They concern petroleum and benzol. As regards the former a bill has been introduced into Parliament giving the government power to develop the latent petroleum resources of that country. At present the production of this fuel is a negative quantity, though for the period 1891-1900 there was an average annual production of 67 tons, this decreasing to a mere eight tons in the ensuing decade, and then ceasing altogether. Experts are satisfied that, given proper development, good supplies will be tapped, since signs of the occurrence of petroleum exist in many parts of the country. For instance, in Staffordshire, which is in the Birmingham district, it occurs in the coal measures of Longton.

The government, too, it is stated, is taking steps to assist in the marketing of benzol after the war through the agency of the Anglo-Persian Oil Co., in which it holds a predominant interest. The proposal is that the British Petroleum Co., formerly a German concern but now a British subsidiary of the Anglo-Persian Oil Co., should actually handle the spirit, of which vast quantities should be available when benzol is no longer required in connection with the production of high explosives.

The government has also decided to investigate the possibilities of Irish peat as a fuel. Peat is one of the many available sources of alcohol. Most engines can be run on a half-and-half mixture of alcohol and benzol, and both of the spirits comprising this mixture are produced in the United Kingdom—the former in unlimited quantities, since it is a vegetable product, and the latter to the extent of about 100,000,000 gallons per annum (after the war). This means that the country ought to be able to produce 200,000,000 gallons annually of an alcohol-benzol motor fuel, or nearly twice of the amount of gasoline that was being imported annually before the war.

A NOVEL CARBURETOR.

Float and Float Chamber Eliminated and It Is Minus Usual Jet.

A carburetor presenting novel features in that the usual float, float chamber and jet are eliminated, has been brought out by an English engineer. The device, which is shown in an accompanying illustration, consists of a vertical chamber having two branches, one at an angle of about 45 degrees and the other placed horizontally and below the first named member. The fuel feed is located in the vertical chamber, while the horizontal branch is the air inlet and mixing chamber. It also contains the usual throttle or butterfly valve.

Serves a Dual Purpose.

The fuel enters the carburetor at the top of the vertical chamber through the pipe A in the accompanying diagram, and falls by gravity through a passage which serves the dual purpose of a fuel

A Novel Floatless Carburetor Having No Chamber for Fuel Supply and Practically No Fuel Jet.

cut-off and the jet in the ordinary carburetor. In this passage is situated a needle valve B provided with a shoulder which, when the engine is stationary, rests through the action of gravity on a seating in the valve passage; this shoulder and the seating are shown at C in the illustration.

How Fuel Is Controlled.

The needle valve is raised from its seating by the automatic air valve D so as to admit fuel into the mixing chamber. This air valve is situated immediately below what we may call the jet, and through the latter projects a taper extension H of the valve B of such a length that, when the engine is stationary, it just fails to rest on the concave top of the air valve. When the engine is turned, the suction on the air valve D raises it so that it in turn lifts the valve B off its seating at C, and allows the fuel to escape downwards through the fuel outlet E; the fuel thus entering the mixing chamber encounters incoming air, and the mixture is drawn past the butterfly throttle G in the ordinary way.

Supply Automatic.

When the engine is started and the throttle is opened more or less, the air valve is raised correspondingly higher by the increased suction, and automatically raises the fuel admission valve higher off its seating so that more fuel is fed to the fuel outlet at E. As the extension H of the fuel valve is tapered, it allows more fuel to pass through the outlet E, which has parallel sides. Not only, therefore, does increased engine speed involve a greater supply of fuel to the fuel outlet as in the ordinary float feed system, but the outlet itself is automatically increased in effective area, while at the same time the air supply also is automatically increased.

Eliminates Flooding.

The sole air intake of the carburetor is shown at F, and it will be readily recognized that for efficient working it is essential that all the air must be drawn under the air valve. Carburetion depends not so much on the reduction of pressure at the fuel outlet as upon the partial vacuum lifting the air valve, and through it the needle valve, gravity then causing the fuel itself to issue into the mixing chamber. Below the air valve is a cushioning spring, and if necessary another spring may be fitted above the needle valve B to assist gravity in effecting a firm seal at C when the engine is stationary.

For flooding, the air valve has an extension or depending stem, so that it may be raised by hand to lift the fuel valve temporarily. It is claimed that greater power and flexibility are obtained and that the carburetor cannot choke with foreign elements.

Predicts Truck Freight Service.

"Within the next few months we may expect to see regular motor truck freight service between the middle west and the Atlantic seaboard," says Eugene Goldman, vice-president and general manager of Master Trucks, Inc., Chicago's newest truck concern. Mr. Goldman makes the prophecy on the ground that the railroads cannot give adequate service when the bulk of our army is "over there," and we are forced to strain our transportation facilities to keep the soldiers fed, clothed and equipped.

"Even in training at the cantonments each man requires supplies to the extent of ten pounds daily, while in service his needs are greater," says Mr. Goldman. "It will be only a question of a few months until we have several millions of men under arms. That means 10,000,000 pounds of supplies at the minimum for each million men. With such a tremendous flood of tonnage going eastward from the middle west our railroads cannot hope to cope with the situation and motor trucks must come to the rescue.

"It is conceivable that the government may put part of the trucks it is buying into such service and it would not be surprising to learn that a company had been formed to operate large fleets of trucks to relieve the railroads of some of the strain of increased tonnage and shortage of cars.

"Roads will have to be built that will permit all-the-year-round hauling by trucks. Some of the highways between the middle west and the Atlantic coast ports are capable of such service now, but there are many places where improvements must be made."

URGES CAREFUL DRIVING.

Secretary of New York State Says Number of Accidents Must Be Reduced.

"A careful driver is the best safety device," says Francis M. Hugo, Secretary of State of New York. "Human ingenuity can devise mechanical contrivances such as will go far in lessening automobile accidents, but it is the careful driver who really holds the key to the situation. There are numerous factors which contribute to the accidents of today, factors beyond the control of even the careful driver; the pedestrian whose familiarity with motor vehicles has bred contempt, the child playing in the street. Broadly speaking, however, the careful driver is superior to the best mechanical safety device that has yet been invented, superior to the gates of the railroad crossing, superior to the warning sign, superior to the slogan.

"The careful driver can take care of himself. His very presence on the road insures greater safety to automobilists. There is little need of a word of caution to men of his stamp. But for thousands of others, mechanical devices, words of caution and even arrest become necessities. Something must be done to decrease the number of automobile accidents in this State.

"While there has been a 36 per cent. increase in the number of automobiles this year accidents have likewise gone up in about the same proportion.

"State and local authorities are today doing their level best to lessen the toll, and the railroads, steam and electric, are doing their best, through publicity, and in other ways, yet the columns of Monday morning's papers frequently contain accounts of a dozen or more accidents, a portion of which are generally attended with loss of life. It is safe to say that at least 75 per cent. of these accidents are entirely due to the careless driver, not always is it true, the person who is injured, but to the other fellow who races along at breakneck speed and imperils both himself and those whom he meets.

"During the last six months approximately 350,000 folders urging greater care in approaching grade crossings have been sent out from my office to the motorists of this State, the folders having been furnished by the New York Central Railroad. Whether or not these folders will accomplish much in the way of results can only be surmised, yet if one of the number has been instrumental in saving a life or a limb it has earned the cost of the entire 350,000.

"In these days when there is a car to every twenty-seven residents of this State of ours there is almost as much of a duty devolving on the pedestrian as there is on the motorist. It is up to both to use care and caution, the one bearing in mind that the pedestrian has certain rights which must be observed, the other remembering that the highways are those of the automobilist.

"The grade crossing problem, however, is one of much concern. Last year twelve persons were killed and sixty-one injured in thirty-six accidents to automobiles at grade crossings on the New York Central lines in this State. During the same year 125 persons were killed and 231 injured in grade crossing accidents on all the railroads in this State.

"According to A. J. McMahon, claims attorney of the Delaware, Lackawanna and Western Railroad, four automobilists were struck in 1915 on grade crossings at that road. In 1916 the number had increased to sixteen and during the first five months this year seven cars had been struck. In 1916 twenty automobiles ran into and damaged gates at grade crossings. During the same period there were three cases in which automobile drivers drove their cars into trains which were standing at grade crossings.

"In conclusion the urgent need of caution is perhaps best demonstrated in figures furnished by Louis I. Dublin, statistician of the Metropolitan Life Insurance Company, showing that of 9,000,000 white persons insured in its industrial department in 1916, no less than 795 met their deaths by automobiles, a rate of 8.8 per 100,000, as compared with 486 in the previous year, a rate of 5.7 per 100,000."

Renovating Worn Pavements.

A method of renovating worn pavements is being utilized with success at Cincinnati, O., and it is said that the process affords excellent traction both for automobile tires and horses.

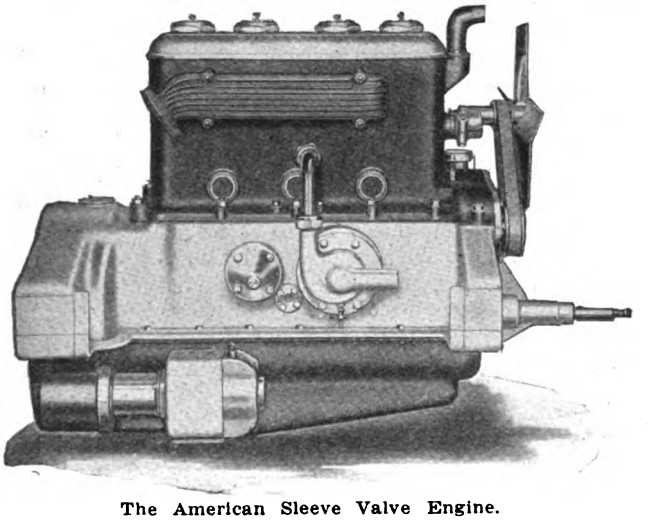
The only new material required by this process is a small amount of cement and sand. The old granite blocks are taken up and thoroughly cleaned of all adhering fillers. The worn out sand bed is removed and wherever necessary the cement foundation is repaired. A new sand bed is laid, using old and new sand indiscriminately, and the blocks are then relaid with about a half-inch space between them.

The relaid paving next receives a thorough flushing with hose, and while it is still wet a mixture of two parts sand and one of cement, with enough water to make it flow readily, is raked and swept into all the interstices. Before this filler dries a finishing coat of sand and cement in equal proportion is spread evenly over the entire surface of the pavement. This surfacing coat makes the street as smooth as newly laid asphalt, and the longer it stands the harder it gets. Four days are allowed for firm setting before the street is opened to traffic.

Experience is that the cement grouting never chips from the granite, but actually becomes better with continued traffic. It affords a non-slippery surface in winter and in wet weather alike. The smoothest tire will hardly skid on it, and, unlike brick and wood block pavings, it does not cause horses to slip.

Streets which were resurfaced five years ago are in as good condition today as when just completed. As fast as the granite pavements need repairing they are being resurfaced by this method until Cincinnati is fast becoming the city of non-skid streets. —Scientific American.

A New Italian Law.



A new Italian law decree concerning reciprocity of treatment as regards auto vehicles owned by foreigners was published September 25. It provided that the application of the regulations in force as to treatment in regard to internal tax for circulation upon public areas, of velocipedes, motorcycles, automobiles and auto craft for private use, imported temporarily from a foreign country and belonging to persons residing in a foreign country, should be made dependent on the existence of reciprocity of treatment on the part of the foreign country in which the possessor of the vehicle that has been temporarily imported resides.

NEW AND INTERESTING THINGS IN MOTORDOM

The American Sleeve Valve Engine.

This engine is the result of long and careful development work and the expenditure of many thousands of dollars in bringing it to its present point of super-efficiency. It is essentially a sleeve-valve engine, and should not be confused with the various "rotary valve"

The American Sleeve Valve Engine.

engines. It has nearly 100 less parts than the average engine of the poppet-valve type. There are, of course, no valve stems, springs, pushrods or cam shafts. It is a high speed engine. It shows remarkable power at low speed, and also maintains a steady ratio of power increase at the higher speeds. Moreover, its acceleration is held to be exceptionally rapid at all speed ranges, thus affording flexibility.

The revolving cylindrical sleeve (between the piston and the cylinder wall) is the dominant feature—the thing that has made this motor possible. This sleeve revolves in a film of oil. It does not move up or down. Only the one simple rotary movement is required. The revolving sleeve is held to possess highly important advantages. First, it gives perfect valve control and perfect timing at all speeds, with the utmost simplicity of construction. Second, it insures uniform compression by equalizing the wear resulting from piston thrust, an exclusive feature. As the sleeve revolves, its ports alternately register with the ports of the cylinder wall, and form the intake and the exhaust openings. These ports can be made any size necessary to insure the maximum efficiency, and as the passages are absolutely free and unobstructed, the cylinder can be entirely cleared of all burned gas at each stroke.

It is claimed that all the advantages of the original type of sleeve-valve engine are embodied in the American sleeve-valve engine in greatly simplified form. Only one sleeve, instead of two, insures efficient cooling. This engine is made by the American Sleeve Valve Motor Co., Widener Bldg., Philadelphia, Pa.

Silvex Installs Additional Battery of 30 Gridley Automatics.

Coincident with the removal into their new concrete and steel factory, the Silvex Co., makers of the well known Bethlehem spark plugs and other automobile accessories, are installing much new equipment including a battery of 30 Gridley automatics. These, together with those taken from the old plant, will be kept busy turning out shells and glands for Bethlehem spark plugs.

To get these machines at this time, Mr. Schwab, president of the corporation, reports that it was necessary to place the order for them more than a year ago.

Under normal operation the new Silvex plant will now have a capacity of 50,000 spark plugs for each eight-hour day.

Plate Glass Windows for Motor Car Curtains.

A successful method has been developed for installing beveled plate glass into flexible motor car curtains. The Johnston beveled plate glass windows are set into wooden frames and cushioned at every point. They will not rattle, break, pull loose or sag and are water-tight. They do not interfere at all with the folding or use of the top and curtains.

They add to the appearance of the car, replacing the celluloid with glass of crystal clearness. They can readily be cleaned, the same as any ordinary window glass. Some 100,000 cars have been equipped with these windows, over half of which are in use on the Pacific coast, where they were introduced under the name of Hartford windows.

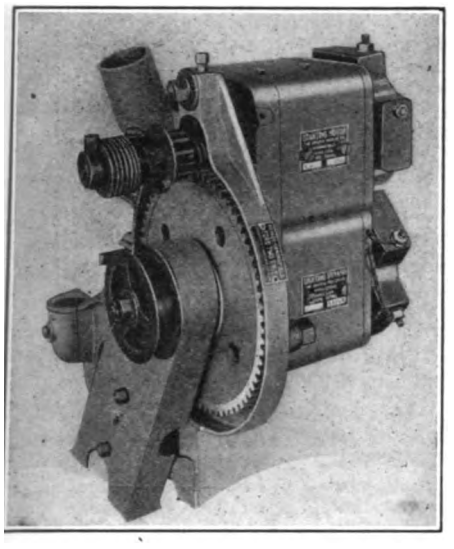
Any shop with tacks, hammer and shears can install Johnston windows. Their introduction has spelt prosperity for the trim shops and local top makers whose source of livelihood dwindled when cars were furnished with tops complete. While the oval and round shapes are the most popular, there are 17 styles in all of Johnston windows, including beautiful diamond and other distinctive shapes.

Prices vary from $2.00 each for round glass windows 4 inches in diameter, to $8.00 for ovals 20x10 inches. They are manufactured by the William R. Johnston Mfg. Co., 359 E. Ohio street, Chicago, Ill.

Illustrating the Johnston Beveled Plate Glass Windows.

The Bearings Service Exhibit.

The Bearings Service Co., Detroit, Mich., is holding shows of its own, in the shape of exhibits, which are being held in 22 different cities as window displays. One of the exhibits is shown this month in our advertising columns, and a great many of our readers will undoubtedly be interested in the illustration, which shows a very attractive exhibit.



Dayton Airless Tires.

An interesting announcement appears in this issue in regard to the Dayton airless tires. The manufacturers state that these tires have been thoroughly tested by at least 50,000 owners of light passenger and delivery cars. It is claimed that the Dayton airless tires are as easy riding as pneumatics and much more economical. These tires cannot puncture, blow out or rim cut. The manufacturers have testimonials from Ford owners stating that 10,000, 12,000 and even 18,000 miles of service have any live dealer as the agency for these tires is granted to only one dealer in each community and considerable good will has been obtained from these simple tires. An excellent opportunity is offered to territory is still open. Dealers who are interested should write or wire for details of special proposition to the Dayton Rubber Mfg. Co., Dept. A. D., Dayton, O.

Heinze-Springfield Starting and Lighting System for Ford.

The John O. Heinze Co., Springfield, O., is marketing a new electric lighting and starting system for Ford cars that presents many interesting and practical features. The design is of the build it "into" rather than "onto" type and this has been accomplished by means of a

Heinze-Springfield Starting and Lighting System for Ford Cars.

patented mounting plate which replaces the original timing gear cover of the Ford engine. By bolting securely to the machined surfaces of the Ford engine, a rigid and accurate mounting is secured.

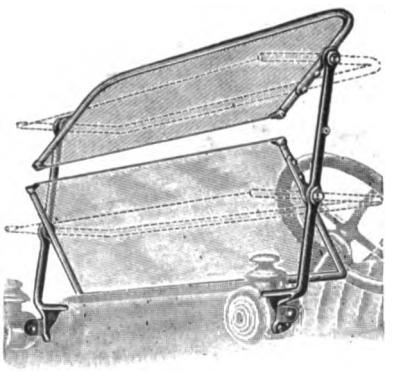
The Heinze-Springfield employs a novel adaptation of the two-unit principle. While the starting motor is independent of the generator, both are mounted on a unit head thus guaranteeing that both the motor and generator shafts are parallel one with the other, and that the distance between them is accurate and fixed. Proper engagement of the automatic Bendix pinion with the large gear is in this way assured.

Drive from the generator shaft to the engine crankshaft is by a silent chain of liberal dimensions and ample strength.

A mechanical cut-out embodied in the combination cowl switch is held to eliminate adjustment, etc.

The switch not only controls the lighting and lighting features, but the Ford ignition as well. It is no longer necessary to shift one's position to use the Ford switch key on the ignition coil case, since this remains in the "On" position at all times. Neither must one hunt around for a heel button when desiring to start the engine. Just turn the lever to any of the "ignition on" positions, and press the button in the center of the switch. The switch lever likewise controls the lighting circuit, and permits of either dim or bright lights while the car is running. When parking, the car may be left with either "lights dim" or "off" as desired. In either of these last two positions the switch may be locked and the key removed. Not only is the switch lever locked, but the starting button as well. The dash equipment includes the H-S switch, a cowl light and an ammeter. These as well as an electric tail light are supplied without extra charge. The system is complete in every detail, even to an all-metal choking device to assure quick and easy starting.

The workmanship and materials employed are of the best. Motor and generator frames are of strip steel of highest electrical quality, bent to shape and welded. The pole pieces are of the laminated type. Four-pole machines are used. The motor is series wound, while the lighting generator is shunt wound, and regulation is obtained by means of the so-called "bucking coil" or reverse series winding.

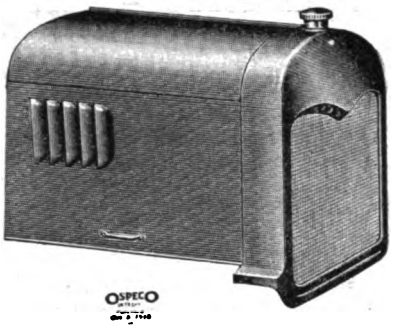


A claim of four hours' time for the installation by one man is made, and complete installation instructions and a complete booklet on the care and operation of the system are furnished with every system. Dealers and garage men interested in electrical equipment may secure complete literature by addressing the Service Dept. of The John O. Heinze Co., Springfield, O. A most efficient organization and quantity production makes possible the sale of this equipment complete in every detail for $85, f. o. b. Springfield, O.

Ospeco Specialties for Ford Cars.

Ford owners and dealers will be interested in the enlarged line of Ospeco products which are being put on the market this year. These articles are offered by the Michigan Auto Products Co., Ford building, Detroit, Mich. This firm was previously known as the Ospeco Mfg. Co. Illustrations of these articles are shown herewith. The Ospeco windshield parts are easy to install and make the regular Ford windshield a full-ventilating, slanting and rain-vision type which adds safety while driving in stormy weather and provides a full circulation of air in front of the driver's seat when desired. The Lawco streamline hood and radiator shell gives old Fords an up-to-date distinctive appearance—a big improvement over the regular late Ford hood.

In addition to these articles, this concern is introducing the Ospeco irreversible steering unit, which makes the Ford steer as easy as the high-priced cars, and it removes road shocks and insures perfect control.



The Ospeco Fill-Thru-Sight-Gauge,

Ospeco Ventilating Windshield.

which has a luminous dial that can be seen at night, is also a welcome innovation, as it enables the driver to determine instantly the amount of gasoline in the tank and enables him to renew the supply without removing the gauge. The gauge fits into the top of the regular Ford tank or it can be furnished fitted onto a regular gasoline filler extension which is placed in front of the seat, directly below the cushion line, eliminating the necessity of disturbing the occupants of the front seat.

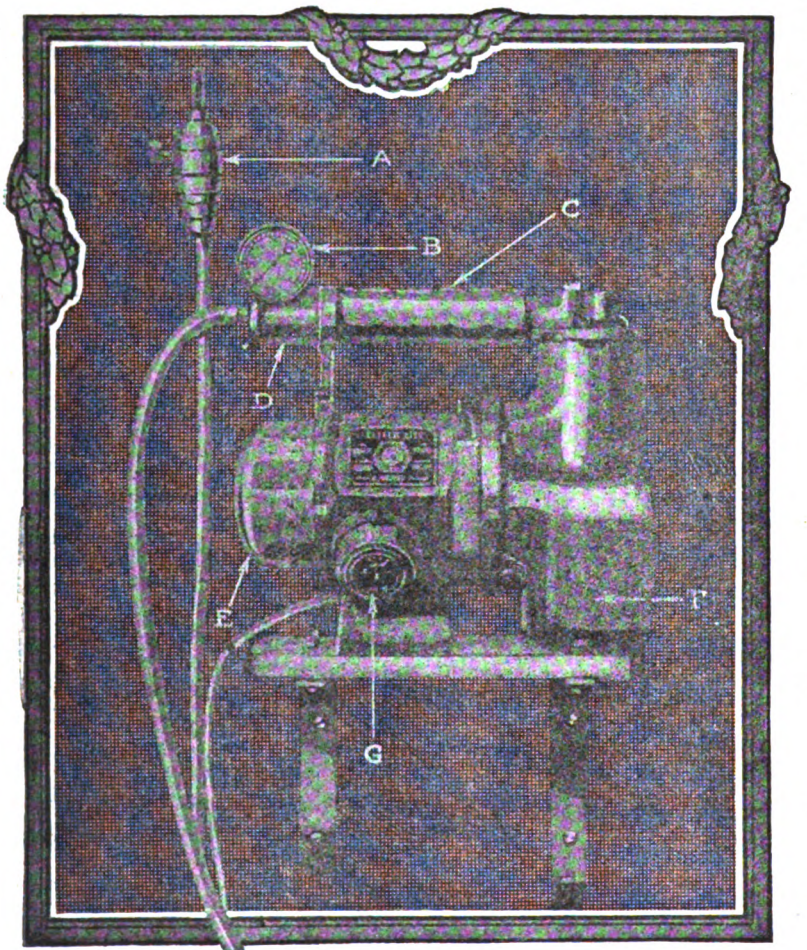
The Ospeco automatic headlight control provides convenience for Ford drivers. When the car is turned to the left, the left headlight remains stationary while right headlight automatically turns to the left; or when a right turn is made, the right headlight remains stationary and the left light turns to the right. This makes it possible when

Ospeco Streamline Hood and Radiator Shell for Ford Cars.

turning corners to view the path in which the car is about to go, as well as enables the driver to look straight ahead. Both lights can also be turned to the right, diverting the glare from the eyes of approaching drivers. The Ospeco automatic headlight control does away with the necessity of dimmers, adds safety and complies with traffic laws.

Full particulars regarding the complete line of Ospeco products can be obtained by writing to the Michigan Auto Products Co., Ford building, Detroit, Mich.

Johns-Manville Auto Accessories.



Dealers who are not already handling the celebrated line of Johns-Manville accessories should get in touch as soon as possible with the H. W. Johns-Manville Co., New York City. This line includes Non-Burning brake lining, fire extinguishers and the Johns-Manville speedometers. The quality reputation of these articles must be already known to a great many of our readers. These accessories are only sold by the manufacturers to legitimate jobbers who in turn stock the retail dealer. Generous discounts are allowed on very small orders. This of course means quick turnovers, dealer enthusiasm and more profit for all concerned. H. W. Johns-Manville Co. maintains 10 factories and has branches in 56 large cities in the United States.

New Plant for Williams Foundry and Machine Co.

The new plant of the Williams Foundry and Machine Co., Akron, O., for building tire repair outfits, is nearly complete and will be operated early in February, tripling the capacity of this department and relieving the shortage in Akron-Williams vulcanizing equipment which has been acute for many months. The building is 275x40 feet, three stories high, and its construction is one of several moves in connection with the recent change in management of the company and the increase in capitalization to $2,500,000.

LECTROFLATER
ELECTRIC AIR COMPRESSORS

A SCIENTIFICALLY CONSTRUCTED SELF-CONTAINED "MOTOR AND COMPRESSOR"

A LECTROFLATER Electric Air Compressor is as scientifically designed, as accurately built and as carefully manufactured as a high grade automobile engine.

That's why LECTROFLATER Pumps wear years longer and give such greater all 'round satisfaction.

They are the most powerful, most capable air pumps of their size in the world.

They are built for hard service, are virtually trouble proof, have an operating expense that is negligible and are guaranteed to pump only cool, clean, dry air.

Note These Features:

A. Operates from any electric light socket, universal windings, uses either alternating or direct current—a big advantage should you ever move where the form of current is different.

B. Accurate automatic air gauge, which shows pressure in tire before, during and after inflation.

C. Condensing chamber, which abstracts all moisture from the air; also serves as handle when pump is carried.

D. Water trap,—the condensed water gathers in this trap and can be withdrawn at will.

E. Patented automatic forced draught air cooling system, ultra efficient. Pump can be run continuously without heating.

F. Lubrication by capillary attraction. Grease—not oil—is used. No oil level to maintain. No oil spray to ruin tires.

G. Handy switch button for starting or stoping motor.

H. The complete unit—electric motor and compressor—is self-contained in a single housing. No exposed working parts, either electrical or mechanical—no exposed gears, shafts, chains or belts. The outfit comes complete—ready for work as soon as unpacked.

THE BLACK &

South Calvert Street, Baltimore, Md.

Look for the LECTROFLATER Exhibit at the Chicago Automobile Show—Armory.

Lectroflater Curb Station. A striking business display that commands attention and holds customers.

No. 2 Portable Tank Outfit. Easy to push around. Very popular in large garages and salesrooms.

DEALERS and JOBBERS

Every garage man, every tire man, machine shop, fleet owner and car dealer needs air service—the better, cheaper and more lasting the service the better for him.

These men are quick to appreciate the superiority of the Lectroflater line. Not only does it permit of a wider selection but the quality of the product plus the many exclusive features insure quick sales and satisfied customers.

We are completing arrangements Now for distribution through established jobbers and dealers. Discounts and catalogue electrotypes will be furnished reputable distributors upon request.

Digitized by Google

MILES of COOL, CLEAN, DRY AIR, CHEAP.

Your modern dealer and garage man has learned the value of cleanliness. He has learned to conserve space, to eliminate unnecessary noise, to value his time, to stop leaks that cost money.

That's why LECTROFLATER Electric Air Compressors are displacing so many old-style pumps—cumbersome, unsightly, expensive-to-operate pumps.

LECTROFLATER Pumps *save* space because they are small and compact in size—built on the idea of an electric drill. Yet they are quicker and more powerful and have a greater capacity than most ordinary pumps three times their size.

A LECTROFLATER Pump IS *economical.* It soon saves its cost in current. It will inflate ten tires from 40 to 80 lbs. pressure at a cost of *one cent.* That means 100 tires at a cost of 10 cents, or a thousand tires at a cost of one dollar.

It IS *quick.* It saves time—your time and the customer's time. It will inflate a 33 x 4 tire from flat to full pressure in 2 minutes.

It is *clean.* There is no place for dirt to gather. All working parts are self contained under a single metal housing free of crevices and sharp corners. It is clean cut in appearance. It is clean working and relatively quiet in operation. And what is more important of all it delivers *clean* air to the tire, air that is free from oil spray and moisture.

It is *handy*—since it is small. It can be carried about like a satchel. To operate merely connect the cord to any electric light socket and turn the switch, **that's all.**

It is strong and durable, built for hard continuous service. It is accurately designed and finely constructed of the best materials obtainable. We have yet to hear of a LECTROFLATER Pump that has ever worn out.

A New Caliper.

An accompanying illustration shows a new type of caliper which has been put on the market by Roy L. Mossman, Humboldt, Tenn.

It is an inside caliper, having in addition the points 2-2 and 3-3, and gives

A New Caliper.

the minimum diameter of circular stock material from which square or hexagon pieces can be made.

Referring to the illustration it will be seen that the distance between the points 1-1 equals the distance across the corners of the hexagon H, or square S. The points 2-2 and 3-3 giving the distance across the flat sides of the hexagon and square respectively. This ratio holds good up to the capacity of the caliper, and whether used as shown, or as an inside caliper.

The Tri-Co Universal Rain Rubber.

This is a very clever device which has been placed on the market for keeping the windshield clear of obstruction to the vision. A light touch works the Tri-Co. It slides like skates on the ice, leaving the glass bone dry. This attachment can be put in position on any two-piece windshield in less than a minute. There are no holes to bore and no adjustments to be made. This rain rubber is very extensively advertised as space is taken twice a month in the Saturday Evening Post as well as in other prominent journals and it is a great seller for dealers at the regular retail price of $1.50. For full particulars, prices, discount, etc., write to the Tri-Continenental Corp., Buffalo, N. Y.

Storm & O'Hair Plant Makes Important Changes.

Because of the great increase of business at their reboring machine factory, it has been found necessary to enlarge the output of the Storm Mfg. Co., Thompson, Ia. (formerly Storm & O'Hair), from time to time to keep up with the incoming orders. So well has this been accomplished, even in their former rather cramped quarters, that at no time have they held up orders more than 10 days, which speaks well for those in charge.

Their new shops have now been in operation since November 15, and even with this increase in capacity they have at present contracts with outside factories for several thousand parts used in the manufacture of the machine. New capital is being interested to provide for further expansion and it is planned to have the new company incorporated as soon as possible. The management is entitled to considerable credit for the wonderful showing already made and with the additional capital and equipment the future will no doubt result in even greater progress.

Corcoran Mfg. Co. at Chicago Show.

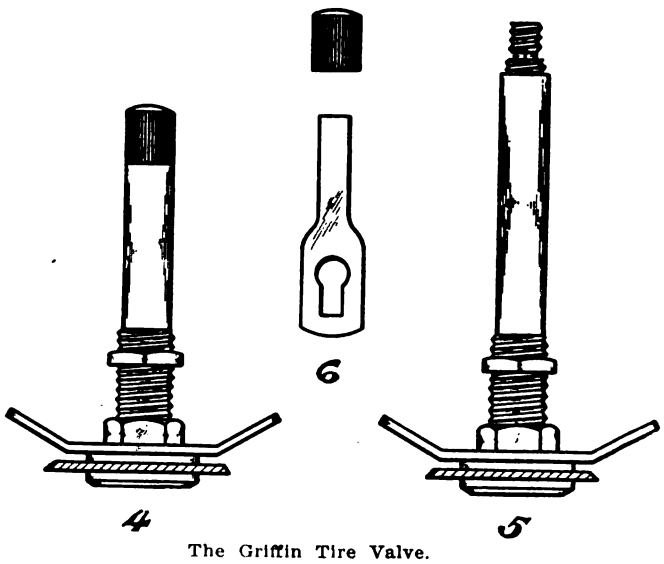
The Corcoran Mfg. Co., Cincinnati, O., who had a most notable exhibit at the New York show, will during the Chicago show, exhibit in Parlor N, mezzanine floor, hotel Sherman. This company manufactures the celebrated Peerless products for Ford cars and these are certainly all that the name implies. The latest addition to this large line is the Peerless tool box which is claimed to be the strongest and lightest tool box ever made. It is designed to meet every requirement of a tool box and is long enough to hold a pump. The dimensions of this box are as follows: 22 inches long, 9 wide and 7 deep. The corrugations on the box give it great strength. The hinges are riveted on, not welded, and the box has a lock and two suitcase type of catches. The entire box is finished in two coats of black japan, and it has a neat and stylish appearance. Each box is packed for the trade in individual corrugated carton, facilitating shipment.

The Peerless tool box will certainly be a great seller during the coming season and it is earnestly recommended as a good specialty for dealers throughout the country. The Corcoran Mfg. Co. is equipped to produce 2,000 of these boxes daily and this capacity will undoubtedly be needed to meet the demand.

A New Schrader Specialty.

In addition to the full line of accessories manufactured by them and including Schrader universal tire valves, tire pressure gauges, tire pump connections, tire valve repair tools and automatic shut-off valves for free air stations in garages, the firm of A. Schrader's Son is showing a new tire pressure gauge for motor trucks.

As shown in the accompanying cut the new gauge has a bent foot or base which permits it being applied to the tire valve of tires on heavy vehicles no matter how small the space between the hub and the felloe of the wheel. As the pressure in such tires must be very much higher than in tires on pleasure vehicles the indicating sleeve of the new gauge is calibrated so as to register from 30 pounds of air to 170 pounds. This will accommodate tires up to 8½ inches.



Schrader Tire Pressure Gauge for Motor Trucks.

As the necessity of keeping up tire inflation is even greater for commercial vehicles than for passenger cars the demand for the new Schrader gauge is apparent.

A New Valve for Automobile Tires.

An accompanying illustration shows a tire valve that operates without a plunger. It is held to be absolutely air tight and inflation or deflation is obtained by a simple opening or closing with the fingers. One of the advantages of the design is that it can be transferred to a new tire when the old tube is worn out or discarded. It is claimed the valve will outwear many tubes. Once installed there is no upkeep. All parts are standard, and the usual caps, felloes and nuts can be used. There are no extra pieces to carry or to insert, such as plungers. This new valve is made by the Griffin Mfg. Co., Boston, Mass., which concern will supply complete details upon request.

The Griffin Tire Valve.

Stops Ford chatter grab and slip

That noisy chat-t-er-ing when you work the Ford brake is more than a nuisance. It means hard, slippery brake linings—waste motion—lost "pull"—car ruining vibration.

ADVANCE CORK INSERT

TRADE MARK REG. COPYRIGHTED 1917

TRANSMISSION LININGS FOR FORDS

stop the chattering because they stop the grab and slip. The buttons of cork never become smooth or hard. Both corks and fabric wear very slowly. One set outwears three sets of ordinary linings.

Cork Insert Transmission Linings make the Ford brake ***brake***—make the car "pull" better and haul heavier truck loads—get ***instant action*** in response to a mere touch to the pedals—give "pep" in the get-away, put positive action in the brake.

Stops Fan Belt Slipping

The ordinary Ford fan belt soon gets "slippery as an eel." That means as high as 25% to 50% lost power. The fan naturally doesn't fan as it should—the motor overheats because it isn't properly fanned—and there's trouble to pay. ***Most*** motor trouble, in fact, results from overheating.

Cork Insert Fan Belt stops slipping throughout its long service. The buttons of cork hold their ability to grip—not affected by water, oil, grease or dirt. Better service, longer wear, greater economy.

PRICES

Cork Insert Transmission Linings $3 per set of 3

Cork Insert Fan Belts, $1 for 1917 Fords, 85c for preceding models

DEALERS Order Cork Inserts from your jobber. Cork Inserts are one of the biggest successes of the year in the trade. Every Ford has to have transmission linings and fan belts. Cork Inserts do the work better—last longer—save money. They are strongly advertised. They certainly do *move* and keep profits rolling in.

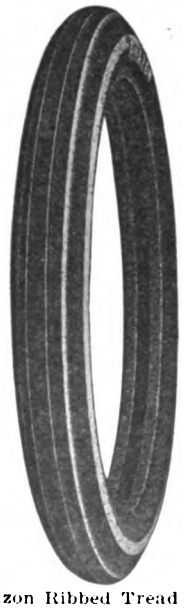
H L B Leather.



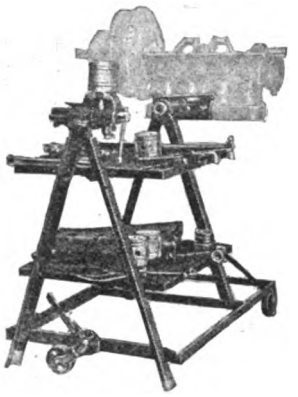
The H L B trade mark on leather goods is the equivalent to sterling on silver, or Tiffany on jewelry. This is the celebrated trade mark of the Hide Leather & Belting Co., 225 So. Meridian street, Indianapolis, Ind. The line of leather goods for motor vehicles manufactured by this company includes flat fan belting, cut lacing, Ford fan belts, V fan belting for grooved pulleys, Leathertax and cone clutch facings, in fact, almost everything in leather which is used around a car. This company also provides an attractive display rack which is furnished free to those dealers ordering the general assortment of H L B belting. This proposition should be interesting to every dealer and correspondence is invited by the manufacturers.

Alcola, A New Product.

The Alcemo Mfg. Co., Newark, N. J., after long experimentation have put a new product on the market called Alcola. It is a substitute for alcohol. It will prevent radiators freezing, even in as cold a temperature as 20 degrees below zero. It is chemically neutral, will not corrode, rust, or injure rubber, leather or other material. It is instantly soluble in cold water. One package is enough for a winter's service. The necessity of keeping practically all delivery cars and a great many passenger cars running during the winter has developed an enormous demand for such a preparation as Alcola.

The Amazon Ribbed Tread Tire.

A graceful and distinctive type of ribbed tread tire is announced by the Amazon Rubber Co., Akron, O. The tire has a glossy jet black body with a circling snow-white stripe on the sides giving it a touch of ultra-distinction and adding character to any car. The new



Amazon Ribbed Tread Tire.

tire has the same wear-resisting tread as the regular non-skid produced by this company and is also reinforced on the side walls with extra fabric breaker strips, affording protection against blow-outs. This anti-blowout feature is held to be exclusive in Amazon Tires.

Ekern's Portable Work Bench and Engine Stand.

The outfit shown in the accompanying illustration is the latest production in the way of work benches and embodies the features of a work bench and engine stand combined. It is especially designed for use in Ford repair shops, although there are many uses it can be put to in general repair shops as well.

It is provided with two large trays

Ekern's Work Bench and Engine Stand.

22x24 inches, where the workman can place tools and parts. The stand is mounted on three 4-inch diameter wheels. The rear castor wheel is so constructed that by pulling the plunger jim, the castor will swing up off of the floor and the stand will then rest firmly on its legs. By kicking the castor lever down, the stand will go back on its wheels and lock automatically.

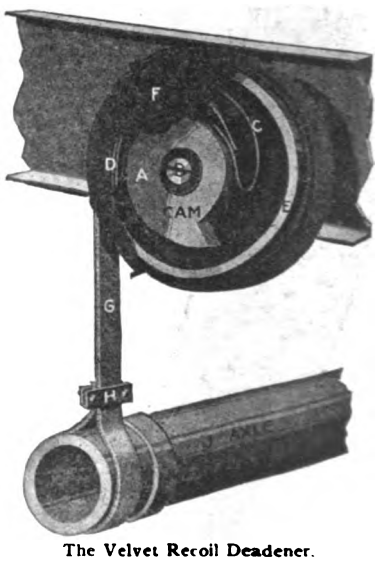
A Ford assembly can be fastened to the stand by the two cap screws which hold the water inlet connection on the side of the engine block. The part fastened to the engine will revolve in the clamp on the stand, throwing the engine in any position or angle, where it can be retained by tightening the clamp screw.

The bench is also equipped with a machinist's vise which has a 3-inch jaw with a 4-inch opening. This will handle any work required in overhauling a Ford engine or axle or other work of similar nature.

The Portable work bench and engine stand is 36 inches high, occupies 27x42 inches of floor space and weighs 120 lbs. The list price is $40. Usual discounts are given to dealers and jobbers. An axle attachment can be used on this bench. This very handy device is marketed by H. G. Paro, 1410-12-14 So. Michigan blvd., Chicago, Ill.

The Stadco See-Safe Windshield Wiper.

This is the time of year when drivers have trouble with steam, vapor, frost and snow on the windshield. The Stadco windshield wiper is a device for remedying this trouble. Due to its inexpensive construction, this windshield wiper sells at the low retail price of 50 cents. A distinctive feature is that it can either sweep straight across the windshield and clean the entire shield or can be pivoted in one spot as desired. An item of interest to the dealer is the fact that this windshield wiper is packed in a neat counter display box holding 12 which materially helps in its sale. Readers who are interested should write direct to the manufacturers, Stadeker Metal Specialty Co., 19 So. Fifth avenue, Chicago, Ill.



Stik-Tite Windows.

These windows can be attached to any back curtain of a car in 10 minutes by anyone and it is stated that they will stick to the curtain as long as the curtain sticks to the car. They are even stronger than the original windows because there are no stitching perforations to weaken the celluloid. The Stik-Tite windows are made in sizes and shapes for all of the more popular cars and sell at retail from 60 cents apiece to $2.50. Dealers are especially urged to see the Stik-Tite exhibit on the mezzanine floor of the Hotel La Salle during the Chicago Automobile show. A unique and practical souvenir will be given to every visiting dealer. If you cannot conveniently visit the Chicago show, write for prices, full particulars and terms to dealers to the manufacturers, the Cincinnati Auto Specialty Co., Elm street, Cincinnati, O. This company also manufactures the Frost King asbestos insulated radiator and engine covers, also a line of top and seat covers.

The Velvet Recoil Deadener.

Illustrated herewith is a new device called the Velvet recoil deadener. It is made on an idea new in shock absorbers. It works positively and quickly and yet it gradually deadens the shock on the recoil of the spring. This device answers an entirely different purpose from the cushion-type Velvet shock absorber, which the John W. Blackledge Mfg. Co., 341 East Ohio street, Chicago, Ill., have been making for several years past, the function of which is to make a stiff main spring ride soft and easy. The Velvet recoil deadener checks the upthrow of the car and makes the car ride easy.

The drum revolves on the pivot bolt B. The cam A is fastened stationary on the pivot bolt B. The drum E revolves on pivot bolt B. The spring C is fastened on the inside of the drum E and when the car goes upward the drum E revolves on pivot A and the spring C

The Velvet Recoil Deadener.

travels uphill on cam A and immediately gradually stops the upthrow of the car.

On the opposite side of the device, another spring winds the drum up and the spring C slides down hill immediately on the cam as the body of the car returns to normal position.

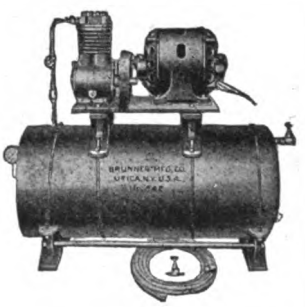
THE BRUNNER GARAGE AIR COMPRESSOR EXHIBIT

AT THE CHICAGO SHOW WILL OCCUPY SPACES Nos. 203, 204, 205, 206, 207 and 208.

A competent force of engineers and sales representatives will be in attendance to explain our line to the visiting Jobbers, Garagemen and Motorists, and whether or not you are selling or using Brunner equipment our representatives will be glad to assist you in solving your compressed air problems. We extend you a cordial invitation to visit our Exhibit at the Chicago Show.

We also wish to thank our friends who displayed so much interest in our exhibit at the New York Show.



Proper tire inflation means more mileage and smoother riding—Brunner Service insures proper tire inflation.

The Brunner Sign is a sure sign of prompt and efficient compressed air service—are you Brunnerwise?

INVESTIGATE THE BRUNNER AIR COMPRESSOR

Every Jobber, Garageman and Motorist who is not Brunnerwise should investigate the Brunner Garage Air Compressor—he should give the compressed air problem more thought—he should know just as much about the air that goes into the tire as he does about the oil that goes into the motor—it is just as important.

Our new No. 15 Catalogue is ready for distribution—send for it today—and let us send you the name of the Brunner Jobber covering your town.

THE STORM & O'HAIR CYLINDER REBORING MACHINES

Will Make BIG MONEY For You

Present War Conditions Make Old Motors Valuable

They all need reboring and rebuilding sooner or later. Hundreds of these are in your locality and need your attention.

Equip to do this work and it will come to you. Get in the game while it is highly profitable.

Don't deliberately send this work, which is rightly yours, out to others; do it yourself and **put the profits in your own pocket.**

STORM & O'HAIR CYLINDER REBORING MACHINES

Are practical and highly efficient equipment with which any repair shop can handle this profitable work.

No shop, large or small, complete without one.

It will save you time and money; keep your shop busy and make extra profit for you.

Make second-hand cars valuable. Don't handle them at a loss. Make a real profit.

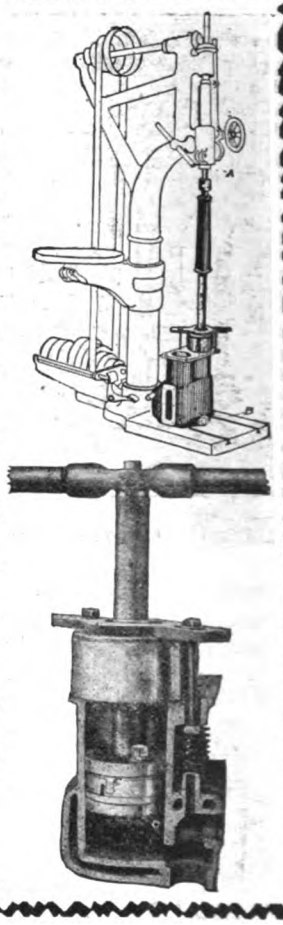
Our Machines Cover All Requirements

Hundreds are in daily use in all parts of the United States and foreign countries.

The Storm Reboring Machine

Rebores all types of motors, automobiles, trucks, tractors, motorcycle and stationary engines of all sizes now in common use.

THE STORM & O'HAIR MACHINE FOR FORDS



The most popular and successful Reboring Machine for Fords now on the market. Put out especially for Ford repair shops but will rebore other 3¾ inch detachable head motors, and being adjustable, can be made suitable for other work should occasion require, by the addition of extra parts. Our machines will increase the popularity and prestige of your shop. Equipped for operating by hand but can be furnished for operating by drill press as shown.

For Sale By Leading Jobbers

We furnish pistons for all makes of motors.

STORM MANUFACTURING CO., Box A-26, Thompson, Iowa

Ten Thousand Questions Answered.

A very important work devoted to the mechanical part of motoring bears the title "Automobile Engineering." This book consists of five volumes, flexibly bound in genuine morocco leather, gold stamped. In the five volumes there are 2,400 pages with 2,000 illustrations, tables, diagrams, etc. The publishers state that these books will answer 10,000 questions about automobiles. Automobile Engineering is published by the American Technical Society, Dept. A-7551, Chicago, Ill. In an advertisement published elsewhere in this journal a coupon is printed which will enable our readers to order this book confidently. It is sold on the easy terms of 50 cents per week and with each set the purchaser receives free a year's consulting membership in the American Technical Society. As practically all of our readers are interested in the mechanics of motoring, many will no doubt be glad to cut out the coupon and send in an order for the book.

Cassidy Co. Becomes Sales Department of Rajah Spark Plugs.

The trade will learn with considerable interest of the arrangements just made between the Edward A. Cassidy Co., New York, and the Rajah Auto Supply Co., Bloomfield, N. J., manufacturers of Rajah spark plugs and Rajah spark plug terminals, whereby the Cassidy organization is to act as the sales department for the Rajah Auto Supply Co. and have entire charge of the selling end of the Rajah business hereafter.

Rajah plugs, one of the best known plugs in the trade, have been manufactured for 16 years, and were one of the first on the American market. They are used extensively by airplane manufacturers and by the Government in their army and navy planes. The majority of all racing cars are Rajah equipped. The winner of Pike's Peak hill climb and the winners of the 20, 50 and 150-mile races at Sheepshead Bay Speedway all used Rajah plugs.

Both the Cassidy organization and the Rajah Auto Supply Co. are to be heartily congratulated upon this connection. The Cassidy Co. enjoys a prominent place and a splendid reputation in the accessory field, and their remarkable selling ability combined with the recognized quality of Rajah plugs should make one of the most successful connections in the industry. A progressive sales campaign is being inaugurated to back up a nation-wide advertising campaign.

An Interesting Prize Contest.

The United Engine & Mfg. Co., Hanover, Pa., inaugurated during the New York Show in their exhibition space a very unique and interesting prize contest. Four prizes were offered to the four contestants who would give the best reasons why they wanted certain machines manufactured by the United Engine & Mfg. Co. The prize to be the machine itself. One prize was offered for the best reasons for wanting a Manley portable crane and similar prizes were also offered with reference to the Manley engine stand, Manley 22-ton press and the Manley 2-tank oil service. This contest will close January 26, 1918, and all reasons must be received at the main office of the company in Hanover, Pa., not later than midnight on the date named. Grammar, composition and spelling will not be taken into consideration by the judges of the contest, but the prizes will be awarded according to the practical character of the papers sent in. The judges of the contest will be Herbert L. Towle of J. H. Cross Co., Philadelphia, Pa., member of the S. A. E.; Louis F. Stoll, representative Class Journal Co., and J. W. Richley, president Richley Automobile Co., York, Pa. This contest is open to all garage owners and repairmen throughout the country and no doubt a very large number of competing essays will be presented to the judges for consideration.

Interesting Engine Catalogue.

We wish to acknowledge the receipt of an interesting new catalogue which has just been brought out by the Witte Engine Works, Kansas City, Mo. This catalogue is entitled, "How to Judge Engines," and contains valuable information which ought to be in the hands of every one of our readers. This book tells you what kinds of work an engine should do and the kind best adapted for general use and using all kinds of fuel. We understand that this valuable book will be sent free to any of our readers who will take the trouble to ask for it, and in writing, correspondence should be addressed to Ed. H. Witte, president Witte Engine Works, 2490 Oakland avenue, Kansas City, Mo.

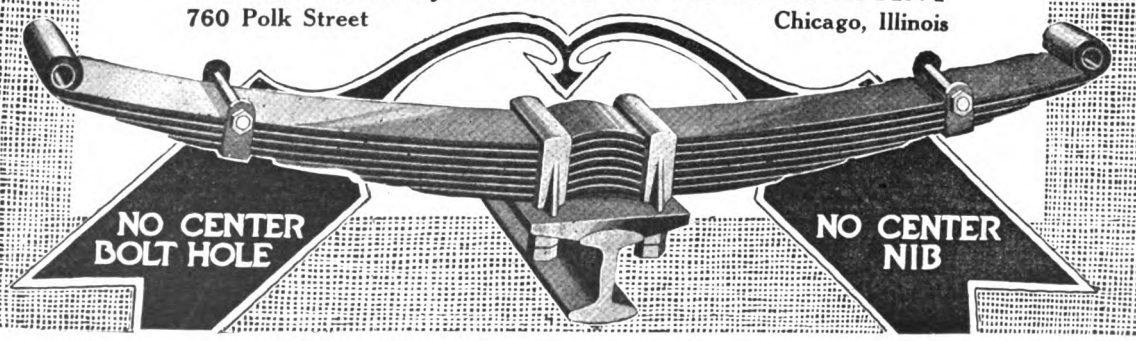
Two Ways of Travelling-Protected

The traveller feels better protected and safer on a railway journey if he purchases an accident insurance policy. It is that feeling of security, that insurance against danger, which increases the joy of the journey when you are riding in your motor car fortified by Tuthill Titanic Springs. The Tuthill Titanic gives you a 37 year, Old Line, Gibraltar-like insurance against accident or possible injury—because they are guaranteed for life against center breakage.

Tuthill Titanics insure easy riding, constant no-squeak lubrication, and the uninterrupted use of your car. Best of all, they insure against constant worry—giving you true peace of mind when motoring with friends and family.

Replace with Tuthill Titanics

In their construction only high-grade steel is used. They are made with our patented center-arch—no weakening center bolt hole—no center nib. With such reinforcement there is no possibility of breaking under strain. They are covered by the broadest guarantee ever placed on automobile springs.



Your Double Guarantee

More Tuthill Titanics are used for replacements than all other makes combined. There is a Tuthill Titanic for every make of car. See them at the Chicago Auto Show. Dealers everywhere know the advantage of selling these quality springs. If you are not supplying your customers today with Tuthill Titanics—write at once for our complete new price list. Sell a spring you can guarantee and which will bring you the business. Your trade appreciates the business. For your nearest Tuthill Distributor, see Chilton's Automobile Directory or Automobile Trade Directory.

The Gibraltar Auto Jack.

This is a jack which has recently been placed upon the market and which ought to be of interest to every garage owner and repairman. With this jack, it is not necessary to crawl under the car in the dust and mud to place it in position, as it is operated by a long, folding, detachable crank handle. The mechanism rests on an end thrust ball-socket which carries entire weight of car. The efficiency and absolute safety of this jack is bound to make it a big seller, especially as it retails for only $7.50. Dealers who are interested should write or wire for dealers' proposition direct to the manufacturers, the Gibraltar Jack Co., Inc., 1902 Broadway, New York City.

Stegeman Motor Car Co. Reorganized.

A complete reorganization of the Stegeman Motor Car Co., Milwaukee, Wis., is in progress, Oscar Stegeman having resigned as president and general manager, his place as president being filled by Adam J. Mayer, treasurer of the Mayer Boot and Shoe Co. L. G. Schertl resigned as secretary and treasurer in favor of Lynn S. Pease, who is well known as an expert on industrial organization. The new organization will continue to manufacture 6-cylinder trucks but will confine the line to 2, 3½ and 5-ton capacities eliminating the 3, 4 and 7-ton sizes.

Master Trucks Show Fuel Economy.

Inquiry among users has been made by Master Trucks, Inc., Chicago, Ill., to find what its internal gear drive trucks show in the way of fuel economy. "With everyone urging economy of gasoline," says Eugene Goldman, vice-president and general manager, "the showing made by Master trucks in gasoline consumption is such that it sells trucks for us every day.

"A Pittsburgh user, a dealer in coal, stone and builders' supplies, writes that he has worked his first convoy of Masters every day under most severe conditions, in nearly every instance hauling an overload of from 25 to 75 per cent. The streets over which the hauls are made are the steepest in Pittsburgh, most of them being rough and unimproved, as the district is one that is just being built up. These two-ton Masters are averaging from 8½ to 9 miles per gallon. He has just ordered another Master.

"There have been instances brought to our attention where Master two-ton trucks have shown a fuel economy of over 10 miles per gallon under capacity load."

Mason Earns Twenty Per Cent. on Common Stock.

The annual report of The Mason Tire and Rubber Company for the year ending October 31, 1917, as read at the annual meeting recently held, shows gross sales exceeding $1,200,000 and total net profits amounting to $181,504.36. Deductions for income tax reserve, preferred stock dividends paid during 1917, and preferred dividend reserve, leave a balance to be put into the surplus account of $104,330.22. This surplus for the year amounts to within a fraction of 20 per cent. on the common stock.

The following directors were elected at this meeting: O. M. Mason, D. M. Mason, D. N. Mason, M. B. Mason, John H. Diehl and R. W. MacKinnon. The officials were re-elected, namely O. M. Mason, president; D. M. Mason, treasurer and general manager; R. W. MacKinnon, secretary. The stockholders voted unanimously to increase the par value of the preferred stock from $10 to $100 per share.

The New Hotel Bingham.

Visitors to Philadelphia, Pa., will find in the New Hotel Bingham on Market street a hotel which is centrally located and containing large, well lighted and comfortable rooms. This is the only hotel in Philadelphia having direct subway connections with all railroad stations and ferries. In the summer season the guests enjoy a beautiful roof garden. The table is noted for its excellence. A club breakfast is served and special luncheons. Rooms without bath may be obtained at $1.50 and with bath, $2.00 per day and up. Rooms may be engaged by writing to Frank Kimble, manager.

MECHANICAL DRAWING.

By ERVIN KENISON, S. B., Instructor in Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. The No. 68 Brunner Stationary Tire Inflater.

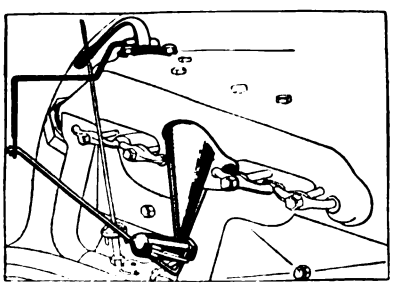
This new Brunner outfit, designed for installing on a wall bracket in a small public or a private garage for pumping direct to the tire, has just been put on the market and the manufacturers claim

No. 68 Brunner Stationary Tire Inflator.



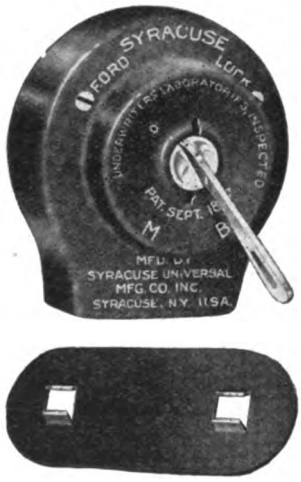
this to be the most efficient and the best constructed air compressor of its type manufactured. The compressor has two cylinders having a bore of 1⅝-inch and a 1½-inch stroke. The compressor will deliver 1¾ cubic feet of free air per minute and 125 lbs. pressure.

The lubrication arrangement is very simple and effective and the net weight of the outfit is 90 lbs. The length is 20½ inches, width 15 and height 12. The motor is geared to the compressor by means of a compressed cloth pinion gear and the compressor is piped to the oil separator with a heavy copper pipe, making a very compact and substantial unit. The compressor has three metal rings on each piston and the motors used are ¼ horsepower compound wound direct current and repulsion-induction type alternating current.

The Brunner Mfg. Co., Utica, N. Y., makers of this outfit, will be glad to supply descriptive bulletins and prices upon request and the outfit will be found with the balance of the Brunner line at their exhibits at the Chicago and Boston shows.

Ford Owners Stop Wasting Gasoline.

The above is a very striking heading which is used in the advertising announcements of the Foot-Air Accelerator Co., 1834 Broadway, New York City.



The Foot Air Accelerator.

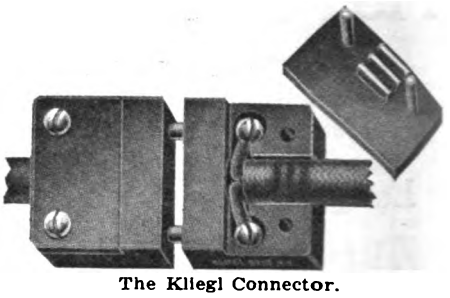
This device is illustrated herewith and Ford owners who have used this invention state that it is certainly a great fuel saver. The manufacturers claim that this specialty will give the Ford car more speed and power, eliminate to a great extent carbon and obtains a cooler engine, also affords greater flexibility and ease in driving. The saving in gasoline is estimated to be from 25 to 33⅓ per cent. for those who use this device. Address all orders and inquiries direct to the manufacturers, the Foot-Air Accelerator Co., 1834 Broadway, New York City.

The Syracuse Lock for Fords.

The new five-tumbler Syracuse Ford lock which has just been endorsed by the Underwriters' Laboratories, is of a design that is interesting and in many ways new in Ford switch locks. One of its novel features is the fact that when the car is locked, the common contact strip through which the current must pass in order to get to the coils, is "grounded." This, the manufacturers claim, absolutely prevents a spark reaching to the spark plugs by rewiring, installing a separate battery, or by any other means without the key.

Another novel feature is the method of connecting up the coil box with the steering wheel column in forming the "ground." This is done by the "ground plate" which, after removing the nuts, is slipped over two of the bolts that help fasten the coil box and the steering

Syracuse Ford Lock and Grounding Plate, Showing Method of Connecting.



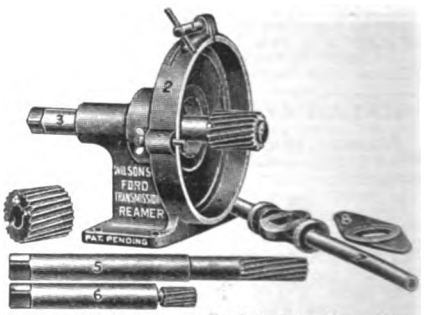
wheel column to the dash. When the nuts are again screwed on the bolts, they force the turned up portions of the "grounding plate" into the threads of the bolts, making a permanent "ground" between the coil box and the frame of the car. The common contact strip is "grounded" to the coil box only when the car is locked, by a spring which is a part of and is operated by the lock.

The lock when in neutral, is securely locked to the switch, independent of the lock casing screws, by a large screw which is made like a tap and is screwed into the key guide hole of the regular Ford switch.

The coils are locked into the coil box by wedging. This allows them to be adjusted but not removed without the key. The lock has five tumblers, allowing many thousand different keys. It can be installed by anyone in five minutes. It fits both the old and the new Ford switches. Three nickel-plated keys are given with each lock. It is manufactured by the Syracuse Universal Mfg. Co., 312 West Fayette St., Syracuse, N. Y. It will sell for $2.50.

Kliegl Electrical Connector.

This device is suitable for making rapid, frequent electrical connections when charging storage batteries in garages, for example, this connector is made of hard fibre, having brass split pins, that fit tightly and make good contacts. The connector is provided at each end with an approved cable clamp with teeth for biting into the cable to hold it firmly by its outer insulation, prevent-



The Kliegl Connector.

ing any mechanical strain upon the connection. It is held to be superior to any other make and is approved and listed by the Underwriters' National Electric Association.

The Kliegl connector is designed for 15 amperes, 125 volts, and is sold at $1.37. Kliegl two-wire connectors are made from five to 200 amperes and 125-250 volts, and three-wire connectors from five to 100 amperes. It is manufactured and sold by the Universal Electric Stage Lighting Co., Kliegl Bros. proprietors, 240 West 50th street, New York City.

Wilson's Ford Transmission Bushing Reaming Machine.

Readers who are doing repair work on Ford cars will be interested in the machine herewith illustrated which is manufactured by K. R. Wilson, 1018 Main street, Buffalo, N. Y. The manufacturer states that this is the only machine or tool made that will ream bushings in all three drums and triple gears. The work done by this machine is absolutely true, giving a perfect fit and alignment. Only two minutes' labor is required to set up and ream one bushing and 25 minutes to complete the overhaul of the transmission. All work done by this machine is absolutely uniform. The manufacturer claims that this machine in any shop will save 75 per cent. of labor costs. The price

Wilson's Ford Transmission Bushing Reaming Machine.

of the machine complete with the triple gear attachment as shown in the cut is $60 or $50 without the triple gear attachment. Write for further description and terms to K. R. Wilson at the address above named.

HUDSON MOTOR SPECIALTIES

HUDSON
UNIVERSAL JOINTED VALVE GRINDER

Do it right! Clean and grind your valves uniformly—no grinding on one side only - this is a perfect worker — not an awkward, rigid, unhandy tool.

The Hudson Valve Grinder is especially useful in grinding the valves on the fourth cylinder of the Ford engine, which is very difficult to reach with the unwieldy solid grinder.

When the shank of this tool is being revolved between the palms of the operator the entire valve is ground ACCURATELY—let this one fact stick!

Price, $1.50

HA-MAA
HUDSON AUTOMATIC MANIFOLD AIR ADJUSTER

Automatically adjusts the air feed through the manifold, at all speeds from idling to highest speed of motor. A motor saver and a gasoline saver.

PROOF FOR THE SKEPTICAL: Adjust carburetor before attaching and you will then find it necessery to cut down carburetor to prevent motor racing. Proof positive that consumption of gas is cut down for same number of revolutions of engine.

GO FURTHER! Place finger over inlet of the HA-MAA and motor stops when idled down, showing that without automatic feed of air the supply of gasoline through carburetor is not sufficient to turn motor over.

THE HA-MAA is so simple of construction that it is hardly believable it is so capable. This permits us to offer the very low

List Price of $1.50

HUDSON CRANK CASE
REPAIR ARM FOR FORD CARS
AN INDISPENSABLE TIME SAVER

Crank case repairs are difficult, expensive and time consuming. The engine must be taken out of the chassis, torn apart to make the repair, and then have a new arm riveted on.

All this is now done away with. In its place you have a simple, quickly executed action, and you are ready for work in a tenth of the time. All you need do now is to loosen three bolts, slip the Hudson Repair Arm in place and tighten!

Who would bother with the old, cumbersome method when he can get the time and labor saving Hudson Crank Case Repair Arm for

Only $1.50

HUDSON
DEMOUNTABLE HUB
A LONG STEP IN ADVANCEMENT

NEITHER A MAKESHIFT NOR A SUBSTITUTE for demountable rims, but superior! It is possible to change four Demountable Hub Wheels while one demountable rim is being changed.

CLAIMS: Lighter—less complicated — fewer parts to wear. No parts to rub or squeak, easily changed and more quickly. Last, but not least—CHEAPER.

NO BOLTS OR NUTS to loosen up or remove. No clamps. Just turn the hub cap and off comes the wheel.

Attachable to any Standard Ford Wheels.

List Price of Set of 5 is $12.50

Bearings Service Exhibits in Twenty-two Cities

We're having an "Auto Show" all our own—and not merely one, but twenty-two of them—one at each of our twenty-two branches.

There's much of interest at these exhibits for every automobile dealer, garage-man and motorist. You'll find here for inspection, Timken, Hyatt and New Departure bearings of every size ever used in motor vehicles—besides valuable books and literature to assist you in getting a maximum of service out of the bearings in your own motor car.

These exhibits will continue during the entire month of January. Don't fail to attend the one at our branch nearest you—and get your souvenir.

Branches In These Cities

DREADNAUGHT TIRES

TOUGH, strong, gripping and enduring is the DREADNAUGHT TIRE, and like the grim Dreadnaught of the sea it has the ability to take care of itself.

DREADNAUGHT TIRES are chuck full of vitality and live to a ripe old age. In addition they lengthen the life of the car itself. Dealers and consumers alike are gratified with the hundreds of uninterrupted miles which DREADNAUGHT TIRES deliver in excess of their Guarantee which is for 5,000 miles. Two famous treads—DREADNAUGHT Reinforced Vacuum Tread and the DREADNAUGHT Ribbed Tread.

The Dreadnaught Tire and Rubber Company

—Contributing to the Spring Scrapheap—

RUMMAGE around in any scrap iron heap and you'll find broken auto springs—and nine out of ten broken in the center. That gives you a clear-cut clue to where the greatest breakage danger lies—right in the center. Shows you, too, that elimination of center breakage is essential to greatest, safest spring service. But in side-stepping weak-centered springs be careful that you don't jump from the frying pan into the fire.

Higgins Quality Springs

FOR REPLACEMENT

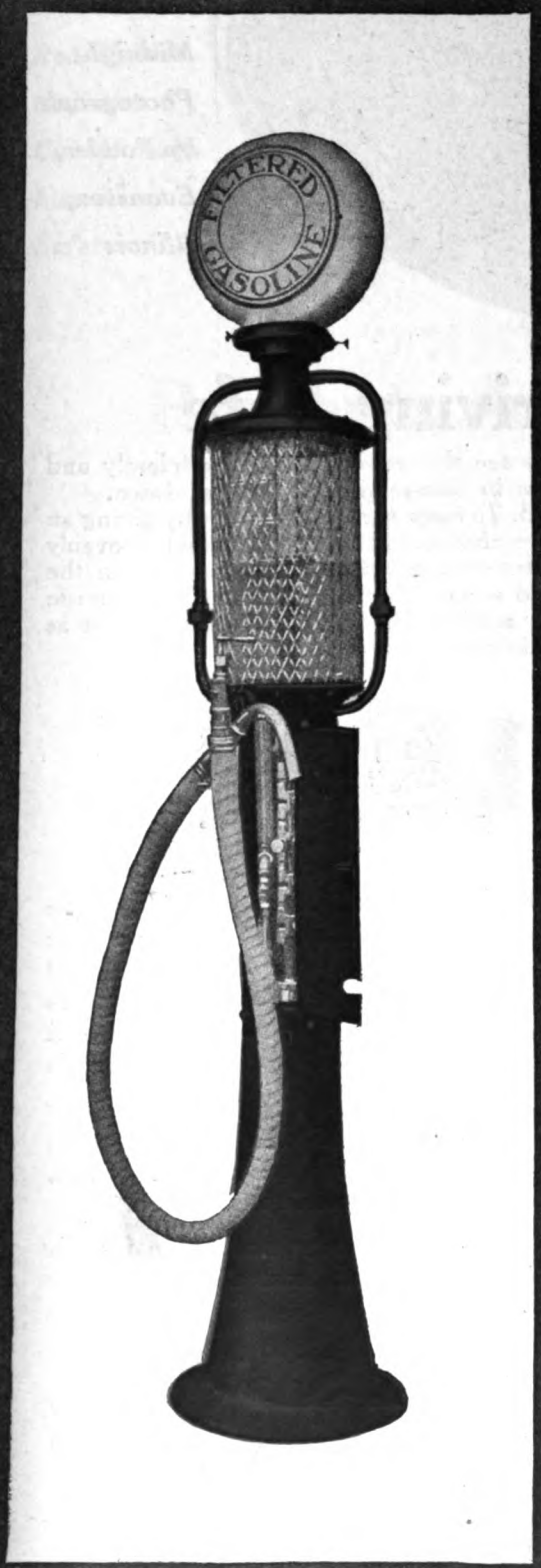
have abolished the center breakage trouble. Not only that, they've mastered practically *all* spring deficiencies. True—other springs have greatly lowered center breakage. The hump has done that. But, in doing it, it has stored up other trouble. They break outside the malleable that holds leaves together in center. Bolt construction—the boring of a hole where strength is urgently needed no longer has any excuse for existence—it has no redeeming feature.

Higgins Quality Springs are "nibbed" together in the center—one leaf dovetails into another—preventing slipping and lending increased strength where it is most needed. Notice the illustration—see the flat back at center. There's *spring* there—there's *resiliency* that sponges up the jars and strength that will "give" and "take" with the hardest going and heaviest loads.

That same durable resistance dominates every point and part of Higgins Springs. The best that scientific skill, care and quality of material have to offer are built into Higgins Springs.

They are right from the beginning. Made only of best grade of motor car spring steel of a special Analysis—properly heat treated—lubricated before assembled with the best squeak and rust prevention known—handsomely finished in black—thoroughly tested before shipping. They "*arrive*" right and they stay *right* on the road—right up to the last minute of use. **Guaranteed the same at all points**

Tell Your Dealer



you want Higgins Quality Springs—insist on having them. Don't be satisfied with a substitute. A "just as good" is *never* as good.

Dealers *Send for discounts, attractive proposition and Catalog C 1917, listing 500 different styles.*

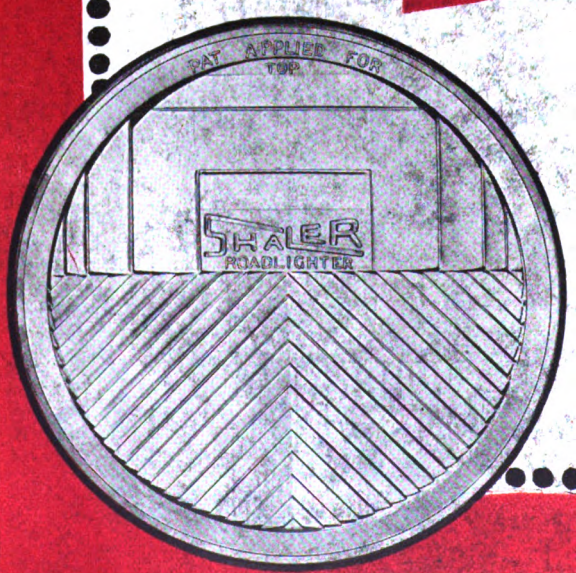
Makes Night Driving Safe



The motoring public has been waiting for a headlight front that performs three distinct functions:

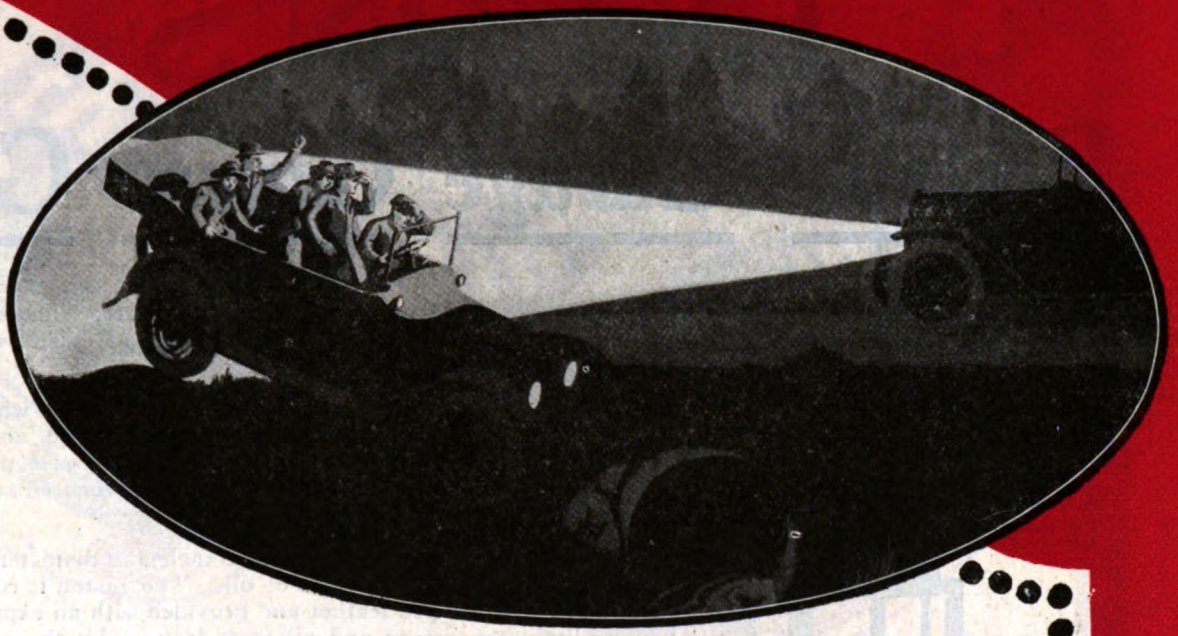
1. To prevent glare from the lights on your own car.

2. To give you a *strong* driving light—so strong that no matter how intense the glare from the approaching car, you will not be blinded but can see the edge of the road clearly and pass in safety without slowing down.

3. *To make night driving safe*—by giving an intensified bright white light which is evenly distributed by prismatic refraction on the road where you need it, so that you can see the road, ditches and danger spots just as plainly as in daytime.

SHALER

The SHALER Roadlighter concentrates the light—which with an ordinary lens is wasted—as extra light on the road. At a distance of 200 feet ahead of the car the light on the road is approximately twice the intensity of that from a bulb of the same candle power, projected through a clear glass headlight.



It obviates the need of dimmers, spotlights, auxiliary headlights and high candle power bulbs, which drain the batteries and impair ignition.

It pierces fog farther than you could see through it by daylight. Its smooth front does not collect mud, snow or dirt.

C. A. Shaler Co.
Waupun

Digitized by Google

SHALER Roadlighter on Either Car Would Insure Safety

Prevents Accidents Like This

The danger of night driving is banished because *the other fellow's glare can't blind you* and your light cannot bother him, if your car is equipped with SHALER Roadlighters. You have intense light from fence to fence that enables you to pick the best part of the road and drive at daylight speed in perfect safety.

The SHALER Roadlighter throws concentrated beams on the edges of the road such as could only be obtained by using a spotlight on each side of the car. This beam is so strong that it counteracts the glare from approaching headlights and enables one to keep a clear view of the edges of the road while passing.

ROADLIGHTER

Pierces the Glare of Approaching Headlights
Illuminates the Ditches
Accurate Focusing Unnecessary
Easy to Keep Clean

Shoots the Light Far Ahead
Legal Everywhere
Rays Penetrate Fog and Dust
Easy to Install

Limited Offer to DEALERS ONLY

Regular retail prices of the SHALER Roadlighter are $2.75 per pair for Ford size and smaller; $3.50 for larger sizes. Packed ten in a carton.

We want every automobile accessory dealer in the United States to try out a pair of SHALER Roadlighters on his own car—*at our expense.*

Mail the coupon for full particulars regarding this big offer. There is no obligation—don't put it off—clip and mail coupon *now.*

Portable Garage Grease Guns

MODEL
A
Holds 20
Pounds

Protected by
U. S. Patents

Stop the waste! Get paid for all your oil and grease. These guns give clean, quick service. They are strong and durable. Register the amount of grease sold each customer.

Consists of a heavy seamless steel cylinder mounted on wheels. Has five feet of hose attached to bottom with shut-off valve and nozzle at end of hose. Register measures accurately the amount of grease put into the axle housing or transmission case, and will work equally as well on liquid oil as on hard grease.

The cylinder is 20 inches long by 6 inches in diameter; capacity, 20 lbs. of grease or 2½ gallons of oil. The piston is covered with best quality cup-shaped leather and provided with an expansion ring which eliminates grease and oil from leaking by the piston.

The piston also has an automatic air vent to release the vacuum in the cylinder when cranking the piston up for refilling. The base is provided with a locking device which lifts the castors up from the floor when cranking.

Every up-to-date garage should have an **Ekern Grease Gun.**

This is "A Most Prosperous New Year" for garage men who handle Inlands. They are ringing out old piston rings and putting in hundreds of new Inlands.

The dealer who handles Inlands has *three special* advantages that no other piston ring proposition offers. He knows that the Inland is *mechanically* perfect—absolutely gas-tight and strongest and most durable.

He *knows* he can get *more* car owners to install Inlands, because with Inlands he can save $5 to $10 per set over any other type of gas-tight piston ring.

He *knows* that Inland's big advertising is convincing thousands of car owners of the economy of installing gas-tight piston rings and of the *double* saving that Inlands offer. If you are not an Inland dealer now make a New Year's resolution to handle Inlands, and get the full business building benefit of Inland advantages and Inland advertising

INLAND
1 PIECE PISTON RING

Strike while the iron is hot.

Send today for *complete free material* which is specially prepared for your local use. It will link *your* place right up with the car owners in your vicinity and bring *you* their overhauling business. Write today.

SPECIALTIES

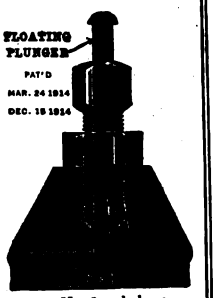
The Mosco Valve Grinder

This tool differs radically from others in several respects. It is really more of a machine than a hand tool, as it renders valve grinding an accurate mechanical operation rather than a guesswork hand job.

Patented March 7, 1916

It has been found that a much more rapid motion can be obtained with the Mosco Grinder than with the ordinary tool, resulting in a very superior finish on the seats.

The device is made of the best materials and is thoroughly guaranteed in every respect. At the low price at which it is listed there should be one in every kit, when it is considered that it is offered not only as a tool, but as a QUICKER, SAFER and BETTER METHOD of valve grinding.

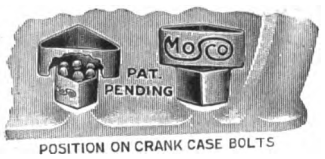


PRICE $1.75.

SIZE (IN CARTON), 3⅝x6¼x3⅝. WEIGHT, 30 OZ.
SHIPMENTS PACKED TO ORDER.

Mosco Floating Plunger Wheel Puller

Starts a "Frozen" or "Stuck" wheel instantly. Strike the plunger; turn the screw, strike again and the wheel comes off without injury to hub-threads, spokes or axle.



Made for 200 models of 40 popular cars.

No. 3 and above

Mosco Socket Nut and Bolt Holder for Ford Car

A REAL TIME SAVING DEVICE. Takes the place of that other man whose help is usually required for this operation. Simply slip MOSCO Nut and Bolt Holder over the top of each engine or Transmission nut or bolt head, the wings protruding above the hex socket engage wall of crank or transmission case and prevent nut or bolt head from turning while the man underneath the car unscrews the bolts.

POSITION ON CRANK CASE BOLTS

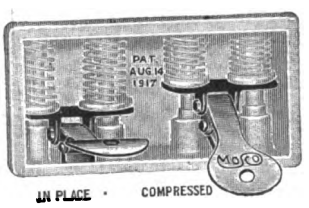
When replacing put head of bolt on top, slip on the MOSCO socket and proceed as in taking out.

Made of heavy pressed steel, with reinforced wings welded to body of socket. All case hardened and finished bright.

PRICE 15c EACH.

Mosco Anti-Rattling Ball Socket for Steering Rod of Ford Car

AN ENTIRELY NEW DESIGN. For taking up the wear and eliminating the rattle on worn ball sockets on both ends of steering gear connecting rod. An occasional packing of hollow hex plug with grease insures proper lubrication, smoother working and reduces wear. Tension of flat spring, which is held in position by head of bolt, prevents the hex plug in end from unscrewing. Slotted in hex end so that adjustment can be ma le with screw driver or wrench. Made of high grade semi-steel.

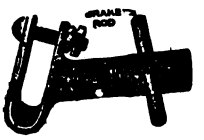


No. 2

PRICE 20 CENTS EACH.

Mosco Valve Spring Compressor for Ford Car

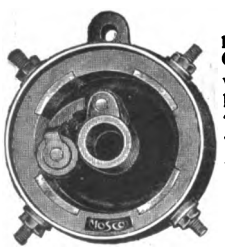
The use of the MOSCO Valve Spring Compressor eliminates what is usually a troublesome operation, viz., the compressing and replacing valve of springs. By using this simple device springs can remain in position until grinding of valves is completed.



IN PLACE COMPRESSED

It compresses two valve springs at one operation and permits removing of pins. Should the pins be crosswise turn valve around until they are in position to pass through slots in compressor. After grinding valves reverse above operation. Made of heavy pressed steel.

PRICE 50c EACH.

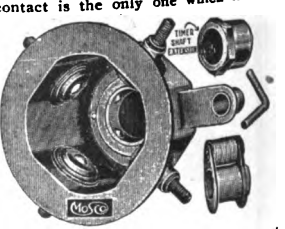


Mosco Brake Rod Guides for Ford Car

Will positively silence the objectionable rattle of the Ford brake rod, without impeding its full movement. The ends of these guides are provided with bayonet lock slots so that they may be slipped over the brake rods without removing same from the car, also the slot is so designed that the rods cannot shake out. The grease cup prevents wear of the rods and permits easy action. Made of semi-steel and very easily applied.

PRICE, PLAIN, 40 CENTS PER PAIR.
PRICE, WITH GREASE CUP, 60 CENTS PER PAIR.

Mosco No. 200 Timer for Ford Car



Patented Oct. 31, 1916

The case is made of extra heavy pressed steel, finished in aluminum. Gray bone fibre is used for raceway, with steel inserts dovetailed in and all lathe finished to a polished surface. The threaded terminals are insulated by fibre washers all the way through to contact points, thus removing cause of short circuiting common to this style of Timer.

Price, complete with brush, $1.50 each. Brush assembly only, $0.40 each.

Improved Bemus Ball Contact Timer for Ford Car

The BEMUS is an IDEAL TIMER for the FORD high speed, short stroke engine, because form of contact is the only one which is correct both electrically and mechanically. This is made by a hardened tool-steel brush, mounted on eccentric cam, engaging spring - pressed steel balls with glancing impact, both the brush and the balls turning each time so that fresh contact surfaces are continually made. The brush comes in contact only with the four balls, touching no fibre or insulation.

MOUNTING is direct on the time shaft by means of an extension piece which is screw threaded on to shaft, and runs in ball bearing placed in recess of timer shell. This means that each of the balls is equi-distant from the brush. RESULT—absolute precision of timing.

SIZE (IN CARTON), 3¾x3x2. WEIGHT, 9 OZ.
PRICE $2.25.

Blankets won't help much if—

if the oil you are using does not flow freely at Zero.

SUPREME AUTO OIL flows freely at Zero.

STARTS WITH THE ENGINE

THIS is most important during the Winter months. You should know whether the oil you are using "flows freely at Zero." All oils do not possess this feature—notably the paraffine-base oils, which thicken up under cold and often cause great damage to the motor.

The safe way is to ask for SUPREME AUTO OIL—it "Flows freely at Zero" and leaves less carbon, owing to the fact that it is a Southern Asphalt-base oil containing no paraffine to gum, stick or thicken.

Portable Two-Stage Compressor
Equipment 35—capacity, four cubic per minute.

The U. S. Two-Stage De Luxe Automatic Air Unit

This is a garage and free air station compressor De Luxe, incorporating more improvements and refinements than any unit ever produced.

It exactly meets the demands of a large majority of garages as proved by the fact that more of this number are sold than all our other compressors combined.

The De Luxe is uneqalled in all 'round features. It maintains high pressure in great volume, is extremely quiet in operation, handsome in appearance, entirely automatic in operation, self-oiling, and requires only a minimum of attention.

To buy a De Luxe compressor means to obtain the best and be assured of long continued satisfaction. This outfit has been tried for you and found not wanting by thousands of garagemen thruout the country and by several corporations of international prominence who have found them so superior as to be adopted as standard equipment for all their installations.

The Leader of a Complete and Remarkably Successful Line

THE Two-Stage principle of operation as utilized in United States Air Compressors has been proven absolutely unequalled and the perfected compressor combined with various tank equipments until the line is now as complete as can be desired, incorporating units for every requirement.

The leading number of the United States line is described at length on this page and several of the other units referred to briefly. The De Luxe Unit is ideal for a majority of requirements; Equipment 48 Duplex suited for garages having unusual conditions, while Equipment 31-T or 41-T are of interest to those who wish to use line shaft drive. Several other units are manufactured and compressors without any equipment whatever may be purchased if desired.

In addition to U. S. Two-Stage Compressors a complete line of Single-Stage Compressors is manufactured as briefly described below. These are as efficient and highly refined as it is possible to produce under the Single-Stage principle.

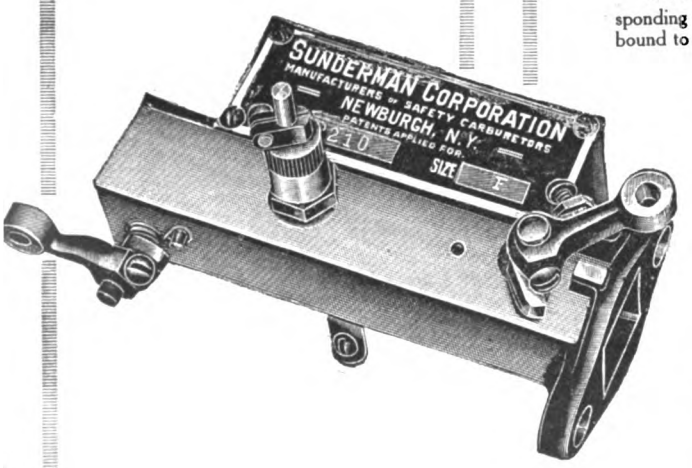
SUNDERMAN
Vacuum Carburetor



$6

F. O. B.
Newburgh

For FORD and METZ
and SAXON 4 Cylinder

For all other cars the prices are $8 and $10, depending on the fittings required. Its service is supreme on all makes and models of cars.

See us at the Chicago Show— Armory Balcony, Booth 5.

Your Carburetor Is Leaking

unless you've already equipped your car with a Sunderman.

You'd sew up a hole in your pocket, or else buy a new pair of trousers, wouldn't you?

Every time you turn your motor over, you're letting some good, hard-earned coin of the realm slip away from you without getting anything for it, unless you have a Sunderman Carburetor.

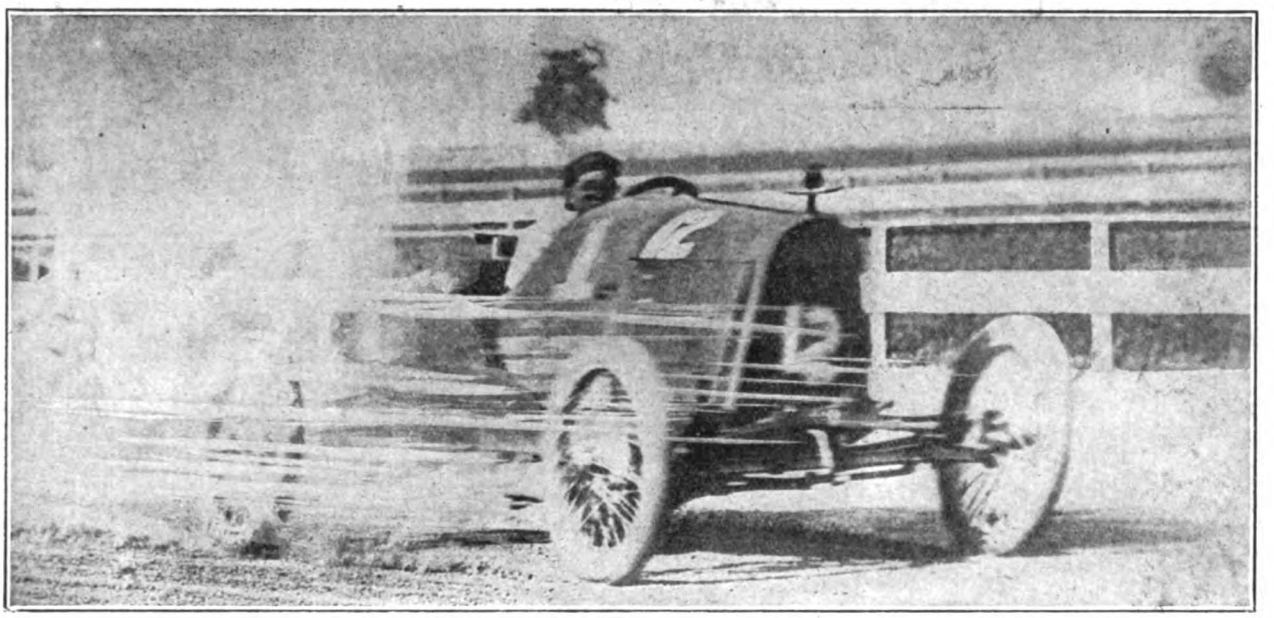
You Can Stop This Leak With a Postal Card

Just tell us to send you a carburetor (give the make and model of your car) and prove to yourself what the Sunderman will do.

It will positively save from 30 to 50% in your gasoline or other fuel consumption—that means it will give you from 43 to 100% mileage increase. We're proving it every day.

It will give your motor more power than it ever had—unless it is ready for the junk pile. Even then it will give it more pep, punch and pull than it has had in a long while.

It will give you better hill-climbing—the surest claim we make—an absolute, unfailing certainty. It will give your engine greater flexibility—a wider range of speeds, low, high and intermediate, taken without "bucking"; a smooth, swift acceleration or slowing down that has hitherto belonged only to the sixes, eights and twelves.



It will give your car a livelier getaway, a quick, sure pick-up, responding to the motor's demands like a great-hearted athlete who's bound to win.

We get in every day's mail testimonial letters from car owners who are elated with the Sunderman Carburetor's performance in power and economy. They know—and we know—what the Sunderman will do. We want you to know—you have ten days to prove it. Send us an order today.

Dealers: There is no better or more favorably known carburetor on the market today. We back it with consistent advertising. We make fine selling arrangements with the right people. See us at the Chicago Show, or write at once.

A Wise Man Never Questions Success

Only the fools do. And when a man or a corporation goes big be wise and admit it.

Do you suppose the great Maxwell success was "the work of the wind" or ability?

Can you question figures like these:

Maxwell dealers	MADE	*in 1913-1914 over*	$2,500,000
Maxwell dealers	MADE	*in 1914-1915 over*	$4,700,000
Maxwell dealers	MADE	*in 1915-1916 over*	$8,000,000
Maxwell dealers	MADE	*in 1916-1917 over*	$12,000,000

Then question not what is in store for Chalmers dealers since Maxwell has taken over the Chalmers business.

For like makes like, and they who have the rare skill of making money for one set of dealers are sure to make money for another set.

Already the Chalmers sales curve has begun to climb. Today it is the highest in Chalmers history at this time of the year. And since the Maxwell policies began to operate the increase in Chalmers business has been just 200 per cent!

A good many wise dealers are taking on the Chalmers line.

Make your pistons gas tight

The MUNGER "ALWAYS TIGHT" PISTON RING OUTFIT—

for **FORDS**
8 "Always Tight" Rings (Regular Size)
4 "Always Tight" Rings (Over Size)
1 Regrooving Tool
1 Ring Insertion Tool

Ready to insert the Munger Re-grooving Tool to true-up a worn piston groove

The Munger Re-grooving Tool in position for cutting. Testing width of groove with an over-size ring

A Munger "Always Tight" Piston Ring being slipped over the Munger Ring Insertion Tool

Showing how easily Munger "Always Tight" Piston Rings can be placed in the piston grooves with the Munger Ring Insertion Tool

MUNGER "Always Tight" Piston Rings

The MUNGER ALWAYS TIGHT EXPANSION JOINT

When piston grooves become slightly worn, i. impossible to fit any rings in them gas-tight without first truing-up the grooves. With each complete set of Munger "Always Tight" Piston Rings is one over-size ring for each piston (to be used in worn grooves) and a Munger Re-grooving Tool with which worn grooves can be straightened quickly and accurately without resorting to expensive lathe work and without even disconnecting the piston from the connecting rod.

All other piston rings begin to lose compression as soon as they begin to wear.

Munger Piston rings *always* remain compression-tight.

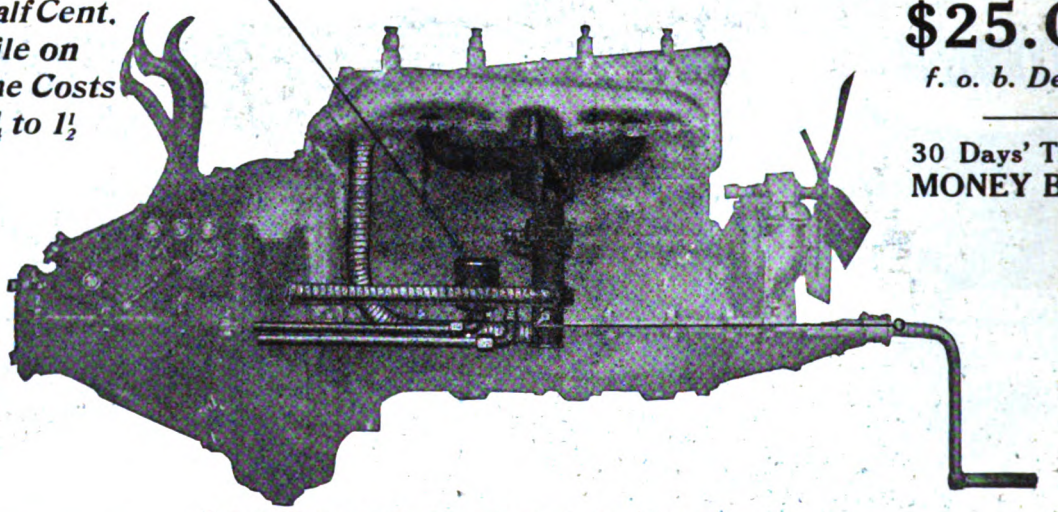
These unique rings quickly conform to the shape of any cylinder and retain their perfect fit until completely worn out.

The wonderful compression-holding power of these simple one-piece rings is due to their scientific design and their accuracy of manufacture. The Munger Expansion Joint, so simple yet so efficient—the patented process of peening, which makes these rings fit the walls of any cylinder—the minute oil grooves, which cause these rings to seat themselves almost immediately—are distinctive features that make Munger "Always Tight" Piston Rings superior to all others.

They are the easiest of all rings to install. With the Munger Ring Insertion Tool even a novice can place them in the piston grooves without breakage or the slightest trouble. And Munger Rings are the most inexpensive, because they are practically wear-proof.

SPLITDORF ELECTRICAL CO., Newark, New Jersey

Get Them from Your Accessory Dealer or Garageman



List price for all sizes up to 3½ in. diameter, $1.25 per ring.

With each complete set of rings a *Munger Piston Regrooving Tool* and a *Munger Ring Insertion Tool* are supplied without extra charge.

Detroit *Kerosene* Equipment For Fords

One Mile on Kerosene Costs Less Than One-Half Cent. One mile on Gasoline Costs from 1¼ to 1½ Cents.

Price
$25.00
f. o. b. Detroit

30 Days' Trial or
MONEY BACK

Detroit Kerosene Equipment attached to Ford Engine showing the entire installation except the Gasoline tank located under floor board.

Use Kerosene
(*Coal Oil*)

A Ford car or truck is a daily necessity. It proves a daily economy.

By using Kerosene instead of Gasoline you can affect a *further economy of 60 per cent.*

Act Promptly! Buy a

Detroit Kerosene Equipment For Fords

Save 60 per cent. of mileage cost

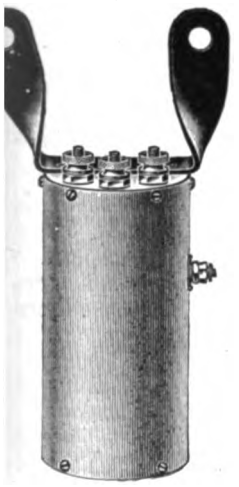
These Are Days of Strict Economy

The Kerosene Equipment ready to be attached to Ford engine consists of:

1. The Detroit Kerosene Carburetor (patent pending) with only one float chamber (for kerosene); the three way valve admits the gasoline for starting.
   Is non-adjustable—throttles down smoothly—idles without loading—increases mileage—is a positive fuel and money-saver—makes no condensation in cylinders and reduces speed changing.
2. Intake Manifold with drying chamber.
3. Flexible tubings.
4. Gasoline tank, tube and couplings.

INSTALLATION

1. Drill a 7/8-inch hole into center of exhaust manifold.
2. Remove intake manifold.
3. Clamp on new manifold.



DETROIT KEROSENE CARBURETOR CO., DEPARTMENT 61 Kresge Building **Detroit, Mich.**

What You Always Have Longed For Is At Last Accomplished

NEW YORK Vibrator-Les Coil IGNITION FOR FORDS

Uses One Powerful Transformer Coil—

Entirely devoid of Vibrators, which in connection with our new Distributor, takes current from the regular Ford Magneto, giving you for the first time since the advent of the Ford car, an opportunity to equip with the same efficient, simplified single unit, non-vibrating Coil Ignition used on all modern, present day cars, with the still further advantage that no storage or dry cell battery is required.

The present bulky coil box is discarded and panel containing switch is fitted in its place—giving a "clean" dash, and much additional room.

We supply Coil, Distributor (containing our new circuit breaking mechanism), elevating gear bracket, wires, cables, and full instructions—no drilling or tapping is required to install.

VIBRATOR-LES COIL IGNITION enables cars to be driven through dense traffic at a snail's pace, and instantly accelerates with a smoothness and power you never believed possible.

Entire absence of sticking contact points, vibrator adjustments, coil replacements, and all ignition trouble, together with easy certain starting, are but a few of its advantages.

Full details given in our booklet.

Price complete as described—$20.00.

Sold with a money back guarantee.

Indispensable to Owners of Ford Delivery Cars and Ford Trucks—because the driver has no Vibrators to "adjust" or other delicate parts upon which valuable time may be wasted.

NEW YORK COIL COMPANY

12 inch Tube Repairs

Can Be Quickly and Easily Made with the

ADAMSON

TYPE "S"

VULCANIZER

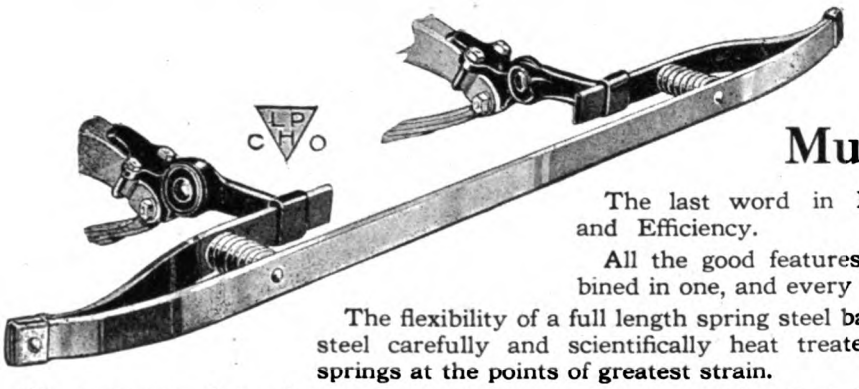
This vulcanizer enables the repairman to give his customers a perfect repair at a low cost and net him a handsome profit for his time. It enables the private garage owner to cut his repair bills to the bone.

The Type "S," like all Adamson Vulcanizers, is entirely automatic and anyone can operate it. There is no waiting to get up steam. No slow, expensive electricity. It's a gasoline vulcanizer — the most convenient and practical vulcanizer made. There are thousands in daily use.

It absolutely will not injure tubes as will many vulcanizers — the temperature being automatically and positively regulated. Its scientific design insures a quick, permanent repair ***always.*** Even a 12 inch repair can be made in fifteen to twenty minutes—that's speed.

There is money for repairmen and garage owners who use an ADAMSON Type "S." More tubes will be repaired next year than ever before because today they cost more. The Type "S" costs but $12, complete as shown here, and soon pays for itself. It will last a lifetime.

There is a type of ADAMSON Vulcanizer for tube and tire repairs of every kind. Priced from $1 to $12. If you don't know the ADAMSON dealer, write us.



THE ADAMSON MANUFACTURING CO.,
EAST PALESTINE, OHIO.

DEALERS—No other manufacturer can offer you a complete line. Tie to ADAMSON — Adamson dealers have sold over one million ADAMSON Vulcanizers, and they all made good. If your jobber can't supply you, write for details, prices, etc.

L P H C O HALLADAY BUMPERS

TWO BIG LEADERS FOR 1918

The New Halladay Multiple Spring Bar

The last word in Bumper Bar Strength, Elasticity and Efficiency.

All the good features of any other bar ever made combined in one, and every weakness eliminated.

The flexibility of a full length spring steel bar of highest grade Swedish spring steel carefully and scientifically heat treated; reinforced by two heavy coil springs at the points of greatest strain.

No matter at what point on the bar the impact is received, the shock is distributed throughout the entire length of the bar and the least possible portion transmitted to the car frame.

The ends of the bar and the two supporting members are secured by a flexible connection that entirely eliminates breakage at that point.

We supply this bar as a complete bumper as shown above or we can furnish it with any of our regular or special fittings either front or rear.

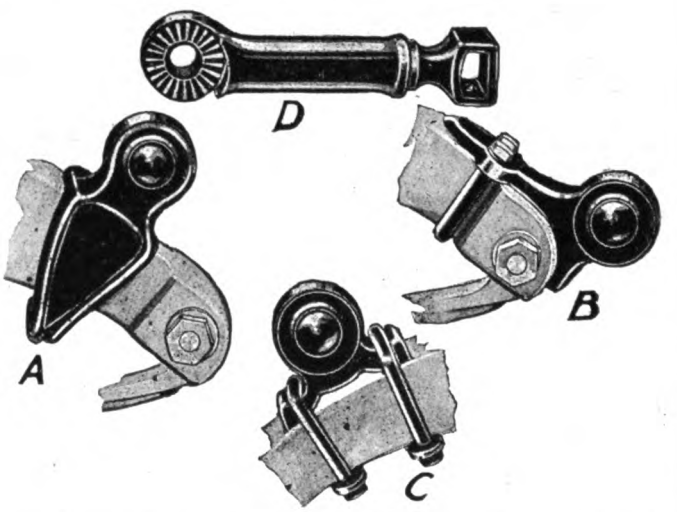
To the man who wants the best that can be made we specially recommend and thoroughly guarantee this bumper.

The Halladay Standardized Bumper Units

In these four fittings we offer the trade the best bumper line ever placed on the market.

It is not an attempt at a universal fitting, but a combination of parts from which may be made up a bumper to fit the front or rear of practically every car on the market except those of extremely specialized design, such as Franklin, Saxon, Ford, Briscoe, and others without front spring extensions.

Fitting A may be used on any frame on which there is room between the fender apron and the spring connection.



Fitting B may be used on any frame in which there is room for the single clip directly back of the spring connection.

Fitting C is specially designed as a rear fitting and works equally well on three-quarter elliptic springs and rear frame extensions.

On rear frame extensions placed so closely to the gasoline tank that no room is allowed the clip bolts of fitting C, fitting A will often be found to work perfectly.

The bar support D fits all these frame connections and being pivoted may be adjusted to any frame angle. Furnished in 8 or 16-inch extension as desired.

The small dealer supplied with these four fittings and an assortment of bars is in position to meet the requirements of practically all medium or big car trade at the least possible nvestment in stock.

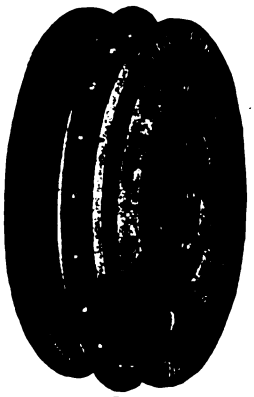
Clears the Windshield Clean Across—Top and Bottom

One Glance and It's Sold. Will You Help Supply the Demand We're Creating?

Show a customer a Tri-Co—show him how simple it is—how practical—how easily applied—and in five minutes you're ringing up the cash register.

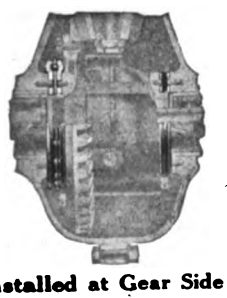
Here's the Evidence—And We've a Lot More

Trade Buys Readily
"It might interest you to know that the Tri-Co is the best windshield cleaner we have ever sold, and we find our trade taking to it very readily. It certainly does the work."
Mutual Motor Stores Co., Chicago



Sells 6 Doz. in One Day
"We sold approximately 6 or 7 dozen Thursday and from one to four dozen the other days. We are glad to co-operate with any live manufacturer on a good proposition the same as yours."
Chapin-Owens Co., Rochester, N. Y.

Sells 36 in an Hour
"We have had a remarkable sale for the past 6 months. On Nov. 1st, '17, we sold 74—36 were sold in one hour. We had no window display or newspaper ad. on this day."
Walbridge & Co., Buffalo, N. Y.



The Tri-Co attaches to any two-piece windshield—it cleans clear across with one stroke.
Users say it's the simplest, most effective windshield cleaner ever devised—and they know. That's why they tell their friends—that's why you'll get repeat orders and new customers for other goods.

Consistently advertised in the Saturday Evening Post. Valuable Sales aids furnished. Order now thru your jobber. Retails for $1.50

TRI-CONTINENTAL CORPORATION - - - BUFFALO, N. Y.

B. B. T. SELLS AT $3.75

Installed at Gear Side of Ford and Chevrolet 490 Differential.

Ford Owners Will Soon Be Asking for the

BAILEY BALL THRUST

To Replace Flat Thrust Washers (2528) at Differential—and Advertised in "Literary Digest" and "Saturday Evening Post"

Every dealer or repairman knows that plain washers (2528) having sliding instead of roller contact wear thin, cause unmeshing of gears and rear axle breaks. But the Bailey Ball Thrust, replacing plain washers to a 1000th part of an inch and containing eighteen ¼ inch micro-chrome balls cannot wear, will keep gears in proper mesh, make them run smoothly and last indefinitely — thereby eliminating axle breakage.

Easier to Sell Than Washers

Car owners have been quick to realize the decided savings in power and freedom from axle breakage with the installation of the Bailey Ball Thrust. Mere explanation of the outstanding features of this bearing is creating easy, profitable sales for dealers and repairmen everywhere. No car owner wants plain washers after having seen the Bailey.

Guaranteed to "Stand Up"

Bailey Ball Thrusts have a capacity for six times the maximum thrust and so will stand up under any strain or hardship. Dealers and repairmen, write your nearest jobber or to us for discounts. Car owners, see your dealer or send coupon for further details.

P-U-L-L
POWERFUL
PERSISTENT

GREATEST improvement ever scored in puller construction. Gives direct—mighty pull that jerks off wheels, bearings, gears, or pulleys—**quick—easy.** Does away with need of special pullers—sweeps aside all their multitude of bothers. Pushes work through in jig time. Lessens labor. Increases garage earnings.

"LITTLE GIANT"
Gear and Wheel Puller

is amazingly simple. Instantly adjustable up to 13 in. Practically indestructible—drop forging and hardened steel throughout. Gives maximum pulling power at minimum effort. Never twists or slips. The principle is right—

"The Harder the Pull—the Tighter the Grip"

In tight places—on delicate jobs—for heavy work—**anything** that demands pulling—it's there. A necessity in the garage, machine and repair shop.

Three Exclusive Patented Features

PASCO WIRE WHEELS

1. THE PASCO WIRE WHEEL has a PATENTED FOUR series method of Rim Punching and Spoke Lacing which makes it stronger than any other wire wheel and 60% stronger than wooden wheels. All spokes cross four others in both the front and rear rows forming a strong double web in the spoke lacing of the wheel hub and rims. Previous methods allow but two or three crossed spokes.

2. THE PASCO HUB CAP is made of a strong, indestructible metal that stands up in crowded traffic collisions, where aluminum, brass and other soft metal compositions will strain or break.

Unusual care has been taken to make it sturdy, massive looking, yet attractive.

3. THE PASCO PATENTED SAFETY LOCKING DEVICE locks the hub cap and wheel on to the threads of the inner fixed hub and axle with a vise-like grip. The device absolutely cannot work loose and allow the wheel to come off from a moving car. It is positive insurance against accident from such a cause. The only way to remove a hub cap is to loosen the locking device and use a Pasco wrench.

Set of 5 Wheels, complete, in Black Enamel for Ford, $75.00.
Other standard colors, $5.00 per set additional.
In black and white for Maxwell, $100.

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

HORSEY'S
DOLLAR VULCANIZER

Anyone can use this nifty one pound pocket size vulcanizer—it is made of steel in one unit.

EXPERIENCE IS NOT NECESSARY

You can do perfect work at all times, in any climate, at home or on the road. All you need is a match to light the "HEAT UNIT TABLET" that is furnished with each patch.

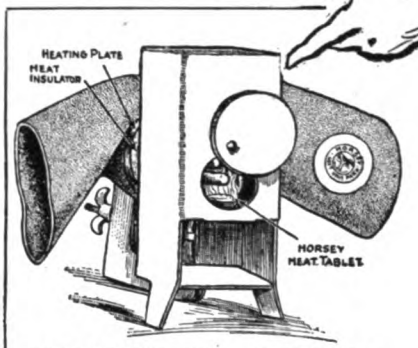
This process does not require gasoline or alcohol for vulcanizing or cleaning the tube—neither can the inner tube be burned—the insulator heating plate keeps body of vulcanizer cool.

There's nothing mysterious about it—simple as A-B-C. It is efficiency itself and efficiency is—"doing the right thing first."

It is the most likeable little proposition you ever shook hands with.

With the HORSEY DOLLAR VULCANIZER you can vulcanize all punctures and small blowouts in Inner Tubes.

HORSEY DOLLAR VULCANIZER is packed in a substantial box with



8 Horsey Heat Unit Patches.
8 Horsey Heat Unit Tablets.
Tube of cement, sand paper and instructions, all complete

PRICE $1.00

Send along the dollar or you can write for more detailed information if you wish—suit yourself.

Note: Extra Box, containing 8 Patches and 8 Tablets, Cement, etc., only costs 50 cents.

Drowning the Magazines

OF INTEREST TO EVERY SUBSCRIBER

By a Reader

I live in a tiny town in the mountains of Vermont. The nearest railroad station is twelve miles away. The population of my town is about four hundred, scattered over a number of square miles, and there is not one of that four hundred who could be referred to as well-to-do. My husband is not well-to-do. He is a rural mail carrier with a route which gives him time to work a little farm.

We have no public library. We are too small and poor a community to afford that. Few books are owned in our homes, and those not offering a variety of reading. But one thing we do have which gives us something fresh to read and which enables us, even in that remote village, to keep some account of the world, and to satisfy that hunger for knowledge which seems to increase as the opportunities for it diminish. We have our reading club, of which I am secretary.

With the sum of our dues we subscribe for all the magazines the money will buy. These magazines are our theaters, our concerts, our lecture courses; they enable us to travel in foreign countries and to know and to understand distant parts of our own countries. They are our art museums. They make it possible for us to talk intelligently to strangers about places we can never hope to see, about the finer privileges of life in which we can never hope to share.

Ourselves and our whole village are the better for articles we read. We have learned the meaning of sanitation; we know why the fly is dangerous; we have compelled the Selectmen to enforce sanitation that we would never have heard of but for our magazines.

Our kitchens are not the same. Our food is better prepared and more tasty. Instead of being backwoods housewives, we try to be as up-to-date as our city neighbors. Perhaps we try harder than they—and we know how, because our magazines tell us.

Twenty years ago the infant mortality among us was an agony. A baby born was received with both love and terror, for we saw how few were his chances for surviving his first three years. Today the love is there, but the terror is gone. We have been taught how to guard our babies, not only to guard them after they are in our arms but before. For this one thing the magazines are precious to us.

Our education is not altogether on the practical side, either, but in those things which make life more beautiful and livable. We cannot know the music of the world, for we have not yet been able to afford a phonograph. But we are saving for one. At least we have learned that if we have not heard it we must hear it. But we do know about pictures and about statues and about architecture. The magazines have shown us those things and explained them to us—and have developed in us an appreciation for beauty.

I could write to you for hours about what changes the magazines have brought about in the lives of myself and my family, in my neighbors, in our whole village. We are not the same. And because the magazines were almost our sole source of information and of encouragement and of inspiration, I place the credit for these changes where it belongs. I do not overstate the fact.

Now I am writing because I am afraid. We have heard that Congress does not understand the place the magazine has in the lives of such as myself, and has passed a law which threatens to interfere with our receiving them as we have. Father and I have studied that law and it doesn't seem just to us. It seems as if Congress, unwittingly, had set out to punish us and to deprive us of the thing that has made us what we are. We are afraid that some of the magazines which are so necessary to us will not keep on in business because they cannot afford to pay the increase in postage that Congress has enacted.

We are afraid that those who do keep on will be obliged to raise their rates of subscription. Do you know what that will mean? Eighteen of us contribute twenty-seven dollars a year. That twenty-seven dollars buys us all I have told you about above. We cannot afford more than twenty-seven dollars, and increased subscription means we must take fewer magazines. We cannot get along without them.

I believe if Congress understood that; if Congress knew about us and how we need the magazines, they would repeal that law. Father has written to our Congressman and our Senator. Once he would not have dared to do that. He asked their help for us. Every family of our eighteen has written. Don't you believe that when Congress understands; when Congress knows about us back here in the mountains, and about our like on distant prairies, it will look at this thing from another direction, and work to give us more of what is so necessary to us, instead of depriving us of it? There must be some way to make them understand.

Will you not write your Congressman urging a repeal of this measure which will deprive many homes of a source of enjoyment and inspiration? If you do not know his name, ask your Postmaster and then write him and address your letter House of Representatives, Washington, D. C. Also write the two Senators from your State, addressing them Senate Chamber, Washington, D. C.

The ALLEN TIRE CASE

FOUR NEW TRADE APCO MARK NEEDS FOR FORDS

SPINDLE ARM ANTI RATTLERS

The best selling repair part for Ford Cars is without a doubt the spindle arm bushing No. 2714, as this wears out quicker than any other part of the car. It is cheaply replaced, but the steering rod commences to rattle as soon as wear starts, and when you consider that one-sixteenth of an inch play in the bushing means an inch play at the wheel, the necessity of keeping the bushings in condition is doubly apparent. The slightest play in this bushing also causes a disagreeable rattle, and causes the wheels to wobble, which means excessive wear on the tires, besides making the car harder to steer.

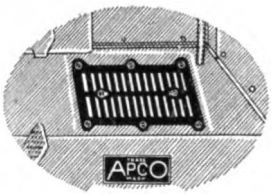
The Apco Silencers consist of two heavy formed springs which can be put on the car in a minute with no tools but the hands. With these on the car, one set of bushings will last two years, and at no time will there be a rattle or play in the steering wheel.

Finished in black enamel, packed one pair in a box, weighing 2 ounces.

40c Pair

TIMER

The Apco Timer gives a hotter, quicker spark, an easier start, more power and speed, smoother running, longer life to the platinum points, more miles to the gallon of gasoline, fewer short circuits and freedom from all those troubles that the regular type timer develops besides being the only renewable Timer on the market. The shell is heavy pressed steel with a single piece steel advance arm riveted on. The contacts are clock spring steel, easily and cheaply replaceable, the insulation is high grade bone fibre. The roller is hardened steel, running on a hardened steel bushing held in a die-casting, which practically eliminates wear. The finish is natural steel. Each Timer is packed in a box weighing eight ounces, and one hundred in a carton weighing fifty pounds.



$1.00 Each

BRAKE ADJUSTER

When the Ford emergency brake shoes are half worn out they must be thrown away, as the brake shoe cams do not open the shoes wide enough to engage the drums. The Apco adjusters are driven over the cams when the shoes are worn and this extends the life of the shoes at least fifty per cent. When new shoes are installed the adjusters can be removed and used again. They are made from high grade steel and will last indefinitely, as they are subject to practically no wear.

25c Pair

HEATER

The Ford owner has never been offered a Heater at a price in keeping with his car, and several months ago we decided that it was up to us to produce a real one and at a price that would bring it within reach of all Ford Owners. The APCO heater utilizes the heat that is blown by the fan over the exhaust manifold and this heat is produced in volume sufficient to heat the entire car in the coldest weather, and in moderate weather the heater can be closed with a slight touch of the foot, or adjusted in the same way to any desired point. The installation is simply a matter of cutting a hole in the floor board and fastening the Heater in place with four screws.

Mitchell Motors Company, Inc., Racine, Wis., U. S. A.

900 Pages instead of 824 **1918—SIXTH EDITION** 3362 Illustrations instead of 2000

STILL $3.32 prepaid **Dyke's Auto Encyclopedia.** STILL $3.32 prepaid

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are **50 Instructions**—Simplified and practical.

3362 Illustrations—the kind you understand at a glance.

2 Supplements, parts printed in colors, treating on the construction operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc.

775 illustrations and **279 pages** on **Electric Ignition, Electric Starters and Generators**, etc.

51 pages and **254 illustrations** on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and **1189 illustrations on Repairing.** Oxy-Acetylene Welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and **180 illustrations** on **Tires** and **Tire Repairing.**

44 pages and **119 illustrations** on **Carburetion.**

89 pages and **291 illustrations** on **Engine** and **Parts.**

16 pages on **Digest of Troubles.**

6000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index** begins on **colored paper, easy to refer to.**

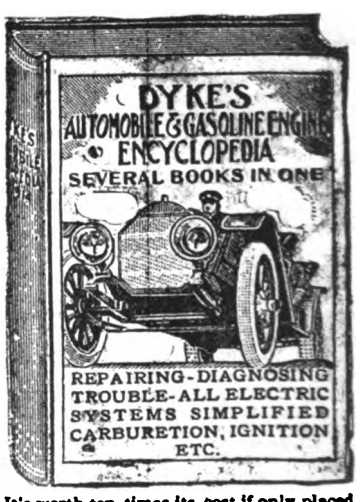
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

You must see this SIXTH Edition in order to appreciate just how complete a book it really is—Order N-O-W.

Price—Although a much larger and better book the price for the present remains **$3.00** (or **$3.28** prepaid, express).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

DETROIT DETACHABLE WEATHERPROOF TOP

Absolutely Storm Tight from Windshield to Rear Window

Eliminates, instantly, all the Ford drivers' former hardships. It is the only all-weather top that does away with the objectionable features of a detachable top and affords the car owner an enclosed or open body for year-round use at a really low price.

It is Absolutely Rattle Proof and Will Last as Long as the Car

Detroit easy sliding flexible doors, which disappear into the roof, are three inches wider than the doors of the Ford; this gives ample entrance for the occupants even though the arms may be filled with bundles. For the other 9 big improvements, see our literature.

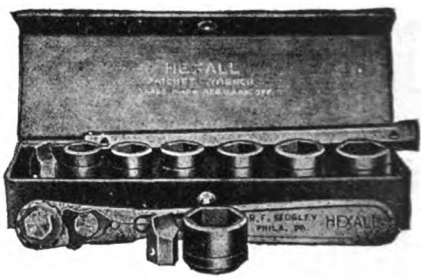
THE VACUUM MUFFLER

Scientific tests have proved that a motor develops MORE power and uses less fuel with THE VACUUM MUFFLER attached than with a free exhaust—you can see how it's built—the violent force of the discharge is deflected against a central cone, and split up into numerous small discharges, each of which is separately and evenly expanded to atmospheric pressure. The little discharges are delivered to the atmosphere one by one, with scarcely any perceptible noise. No carbon gathers in the VACUUM MUFFLER and its construction does away with Muffler explosions. It is guaranteed against blow-outs.



You ought to send for full particulars—write us today.

VACUUM MUFFLER CORPORATION,

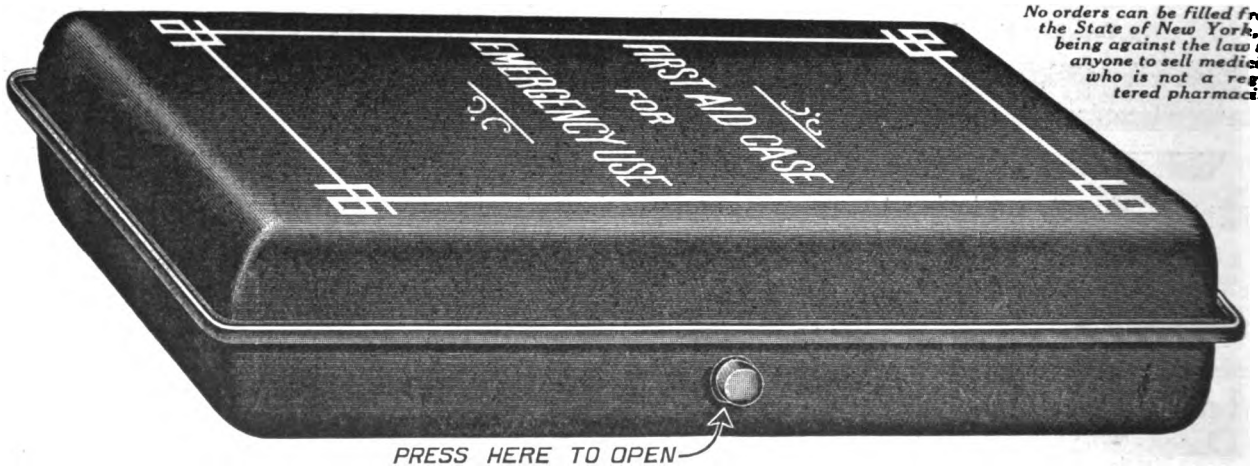
MANUFACTURED BY



SMITH & HEMENWAY CO., Inc., 83 Coit Street, IRVINGTON, N. J.

IT MAY BE YOUR TURN NEXT

TO MEET WITH AN ACCIDENT ON THE ROAD.

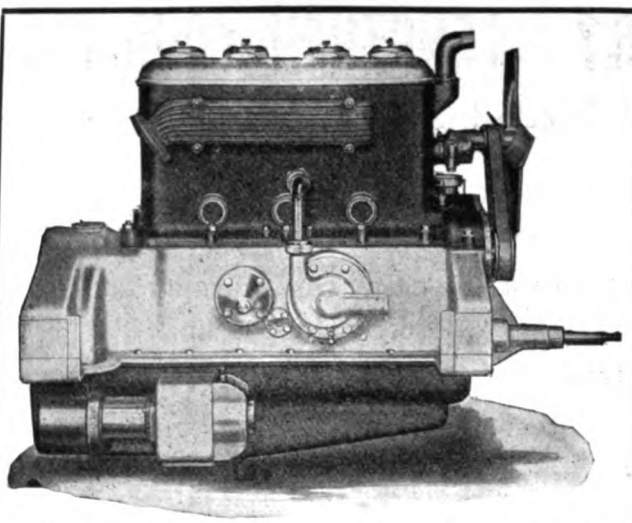
It may also be a case of life and death to have the materials at hand for prompt treatment. We have recently made arrangements for a First Aid Case for emergencies especially for the readers of the AUTOMOBILE DEALER AND REPAIRER.

No orders can be filled from the State of New York, it being against the law for anyone to sell medicine who is not a registered pharmacist.

This case is made of heavy Bessemer Steel, size 11½x5½ and 2¼ inches deep, finished in Black Baked Japan and fitted with a strong instantaneous snap. It is strong enough to resist injury to the contents through accident or dampness.

The contents have been carefully selected to supply the needs in an emergency, before the doctor comes. All gauze, bandages and cotton have been prepared in aseptic laboratories under the same rigid inspection as those supplied to the United States Army and Navy.

The contents of this case consists of:—1 "First Aid to the Injured" Instructions. 1 Yard plain Sterilized Gauze for dressing large wounds. 10 Yards 2-inch Sterilized Gauze Bandages for dressing cuts and bruises. 10 Yards 2½-inch Sterilized Guaze Bandages for dressing cuts and bruises. 1 Package Sterilized Absorbent Cotton for pads and dressings. 1 Box Carbolic Salve for burns, sores, insect bites, etc. 1 Yard 1 inch Zinc Oxide Adhesive Plaster for retaining dressings and covering small wounds. ½ Ounce Tincture of Iodine, an antiseptic for immediate use on all wounds and abrasions. ¼ Ounce Spirits of Ammonia for use in case of shock, heart failure and faintness. ½ Dozen Safety Pins.



The retail price of this outfit is $2.50. We have made an arrangement with the manufacturers of such a liberal character that we can supply this outfit with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year, for the low rate of $2.80.

In case you have already subscribed for this year, we will send you one of these outfits, postage prepaid, on receipt of $1.80, which may be remitted by check, money order, or in any convenient way.

Every subscriber to the AUTOMOBILE DEALER AND REPAIRER should have one of these outfits. It may mean the saving of your own life or the life of some friend. ***ORDER AT ONCE AND THEN YOU WON'T FORGET ABOUT IT.***

THE BUSINESS OF THE TIMES

Tire Repairing

As the utmost conservation is now a National necessity in every line, auto tires will be repaired and kept in service longer than ever. This means that the already enormous demand for tire repairing will be doubled, perhaps tripled.

Start in the business—or increase your present output—now, with this great equipment—

Type F, Big Capacity Vulcanizer with Self-Contained Boiler

still selling for $150, but probably higher in the spring.

We make a complete line of Tire Repair Equipment. Catalog on request.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table" on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

SAVE TIME AND MONEY
WITH THE
Stewart Handy Worker

$14
Complete
(Worth $25)

A wonderful combination of tools (six in one). Every public garage, small or large, should have one or more of these handy machines. Saves much valuable time and money. If these tools were bought separately, would cost $25 or more.

Outfit includes strong practical anvil; powerful vise up to 4½ inches; a sure-grip steel pipe vise; corundum grinding wheel, 5 inches by 1 inch; a two-speed drill press with two drills; a metal cutting wedge and driving mechanism of three speeds—direct 4 to 1 and 16 to 1—easily regulated by changing handle grip. It operates grinding wheel, buffing wheel and many other similar tools.

Our Special Offer

Send $2 with order for one of these outfits, pay balance on arrival. If not satisfactory in every way, return it and money will be refunded. Descriptive booklet mailed on request.

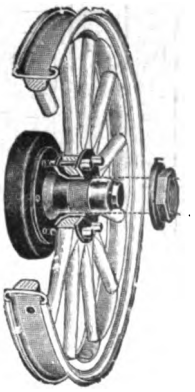
H-S

"MINUTE"

DEMOUNTABLE

WHEEL

for



FORD CARS

"One nut to unscrew
That's all you do"

The quickest tire change in the world

H-S Minute Wheels are as great an improvement over demountable rims as demountables were an advance over the clincher rims of former days.

With this time saving device, Ford owners can change tires in sixty seconds. Therefore, why waste fifteen to twenty minutes on a tire change?

Your Ford customers will welcome a chance to escape the drudgery and inconvenience of tire changing, especially during the winter months and spring rains.

Install a set on your own Ford and watch the interest created by the Minute Hubs. Let some grouchy doubting Thomas, who is sure "It can't be done," remove the large nut with the powerful Minute Wrench and make the change himself in a Minute. This simple stunt never fails to convince. Minute Wheels are easy to install, and easy to sell.

It will pay you a substantial dividend to take advantage of our special direct-by-mail advertising proposition which we offer to dealers placing an initial order for four sets of Minute Wheels. We send a series of illustrated letters to your customers on your letterhead at our expense. Send for complete story.

We can help you build up a profitable business on Minute Wheels if you are ready and willing to do your part.

DU PONT AMERICAN INDUSTRIES

The Auto Specialty That Sells Itself

100% efficiency is solving one of the most vexing problems of motoring.

Pontoklene removes tar like magic! Makes tar melt and run like the proverbial snowball in a real hot place. Is also a perfect grease and oil remover—restoring the original polish of a car without rubbing. Much better than gasoline for cleaning engines.

Successfully established wherever introduced by distribution of samples. Every sample makes a buyer.

Garages supply it to their car washers because it saves hours of time and insures clean work.

The empty can makes a fine reserve oil carrier.

Prices:—1/4 Gallon, $1.00—1/2 Gallon, $1.50

Quantity Discounts to the Trade.

Delivered free upon receipt of price if no dealer in your city can supply you.

Special Proposition to Dealers and Distributors.

Get Pontoklene in stock quick—before the road-tar season starts. We will help you introduce it. After that it sells itself. Write us today.

Dearborn Two-Ton Unit attached to Mitchell Chassis

Dearborn One-Ton Unit attached to Dodge Chassis

Dearborn Two-Ton Unit attached to Cole Chassis

Dearborn One-Ton Unit attached to Hupmobile Chassis

Dearborn Two-Ton Unit attached to Glide Chassis

Dearborn Truck Units can be attached to any make of car, converting it into a motor truck of one or two-ton capacity. You are no longer confined exclusively to the Ford.

The demand for trucks this spring will be beyond the ability of truck builders to supply. This means a big business for dealers in converting pleasure cars of all types into motor trucks.

Dearborn Truck Units are time-tried and proven. They have been successfully attached to over 60 different makes of cars. They are not an experiment. The Dearborn Truck Company is a sound, successful company operating its own plant.

Dealers—Write Now

Dealers should write at once for proposition, full particulars and specifications. The Dearborn offers you a wonderful opportunity for a large truck business in 1918.

Many Kinds of Economy With Firestone Tubes

ONE of the strongest factors for extra measure of tire mileage is the protection given the casing by the enduring liveliness of the Firestone Red Inner Tube. It is built, layer on layer, by the laminating process, into one integral unit of endurance against heat and grind. This tube means for the man who sells it, the lasting economy and long-time dividends of good will.

Firestone Red Tubes sell best because they serve best. The prices are eye-openers on all the Firestone values. The facts will be plain to any motorist who buys Tire Accessories. If a Firestone Tube, which anybody can judge on sight, can be so good and yet sold so low, Firestone Tire Economy must be a fact.

Write for the Firestone sales-helps.

An accessory line distinguished by trade protection and user satisfaction

MORE than ever this year Johns-Manville will depend on the trade for the distribution of accessories, which is the reason why we again emphasize our trade protection policy. We sell only to the recognized jobber. He stocks the retail dealer—and the margin he allows even on very small orders is liberal. This means quick turnovers, frequent re-orders and more profit for all concerned.

Because Johns-Manville accessories are of a satisfying quality—consistently advertised—they are easy to sell to the ultimate consumer. To prove this it is only necessary to point to Johns-Manville Non-Burn Brake Lining, the Johns-Manville Fire Extinguisher and the Johns-Manville Speedometer. Each excels in its own field through perfection of design and dependable quality. And this year we will again advertise these advantages consistently. Ask your jobber or our nearest dealer for complete information.

THE YOUNGEST MEMBER
Of the Crane Puller Family

OUR No. 0 TWO ARM PULLER

Designed for all kinds of small work—including timing gears, magneto and pump shaft gears, etc., that are designed to be removed by stud-bolts screwed in tapped holes in the web.

The forked stud-bolts, shown attached to the hook end of the arm with pins, are furnished blank and can be drilled and tapped by the purchaser for the proper thread for his work; and case-hardened headless set screws can be used for the stud.

This puller takes light work 5 inches in diameter and 3 inches from the end of shaft. It has the new patent Locking Arms, forked stud-bolts and case-hardened screw.

The List Price is $2.50 Purchase from Your Jobber

HUDSON MOTOR SPECIALTIES

HUDSON UNIVERSAL JOINTED VALVE GRINDER

The most successful grinder made

Away with all the old tools that grind valves only on one side—

Here's a sturdy, reliable Valve Grinder that hits the bull's-eye every time—grinding the **Entire** valve accurately — **Very** accurately. No guesswork about this tool—it's the straight goods.

It is fitted with a universal joint that allows the working end a certain amount of motion in any direction relative to shank—it is great for grinding the valves on the fourth cylinder of the Ford engine.

GET IT! Price $1.50

HUDSON CRANK CASE REPAIR ARM FOR FORD CARS

Just the right thing in the right place

Here's the crack-a-jack time saving idea for 1918. Crank case repairs are no joke—the engine must be taken out of the chassis, torn apart to make the repair and then have a new arm riveted on.

All that nonsense is now thrown in the discard—you can be ready for work in a tenth of the time—all you need **Now** is to loosen three bolts, slip the **Hudson Repair Arm** in place and tighten. It's a cinch!

GET IT. Price $1.50

BOSTON SHOW EXHIBIT will be at Booth of Motor Car Equipment Co.

Don't fail to send for literature that gives you all details on Hudson Motor Specialties

POWER

RAJAH

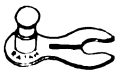
Terminals and Adapters

Rajah Regular Clip Terminal

Adjustable to any cable. With the extra collar supplied fits any make of plug.

Rajah Thumb Nut Terminal

Adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six, Pullman.



Rajah Packard Terminal

Adapter for Packard 4 and 6 Cylinder.

Rajah Ferrule Clip Terminal

With any size ferrule required. Fits any make of plug with the extra collar supplied.

Rajah Stud Terminal

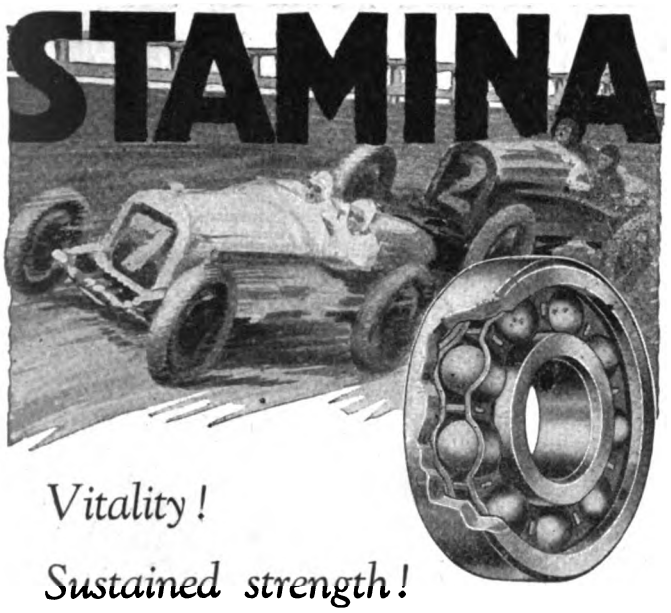
Adapter for Buick, Chevrolet, Oldsmobile.

Terminals and Adapters are furnished so that Rajah Plugs can be used with any car not equipped with the Rajah Type of terminal.

THAT'S what the car owner wants most of all—power to take the hills, power to pass the road loafers, power to negotiate a stretch of heavy going.

A slow, lazy, weak spark hasn't a chance. It takes the quick, hot, brilliant spark of a Rajah to turn the trick.

Whether it is a hill climb like Pike's Peak or a gruelling struggle between racing cars, or an airplane flight, it is all the same to Rajah Plugs. No test is too severe.



Talk power to your trade—the power that Rajah Plugs deliver—every mile—all the time.

Sell Rajahs in sets. Get car owners to completely equip and their performance will build up a trade that is permanent and lasting.

The 1918 McGREGOR LINE

THE NEW McGREGOR COMBINATION SPRING BUMPER

Is All That Its Name Implies—The Very Latest and Best Bumper Made

Our different types of bars are made of High Carbon Steel. The Spring members, or arms, are made of High Carbon Spring Steel, and are fitted with universal adjustable brackets, applicable to any make of car, with extended frame, either front and rear.

This new bumper does away with the necessity of stocking a number of special front end bumpers, to fit Packards, Cadillacs, Dodges, and other cars with interfering mud and splash aprons. We make rear end bumpers with special designed arms, applicable to 99% of cars manufactured.

We have eliminated the Malleable Iron Arm, and now make an all Spring Steel Arm, insuring the greatest resilience and Shock-Absorbing qualities obtainable in a bumper.

Eight Points of Adjustment

facilitating installation and eliminating in most cases the use of pulleys

Every motorist is quick to appreciate this exclusive, patented feature of the Petry Cut-Out.

Yet it's only one of the many constructional advantages of a cut-out scientifically correct in every detail.

The first device of its kind to give permanent satisfaction. Expels the exhaust gases through a full-size megaphone-shaped vent which greatly augments sound and facilitates tuning up of motor. Has adjustable lever, positive cut-off, non-fluttering valve, and is absolutely noise-proof when closed. Spring cannot anneal from the heat. Makes a gas-tight joint of permanent rigidity without strain on exhaust pipe. Easy to install and easy to operate. A size perfectly suited to every car.

YOUR AIM—

is to sell spark plugs **built** for service. A profitable, worthwhile business results only when customers are sold plugs **made** to make good. Then, why attempt to get "close" with selling arguments, catch phrases, wrongly-drawn conclusions? "Hit" the bull's-eye with plugs of **tested,** war service reliability.

REFLEX SPARK PLUGS

KEEP THE CAR ON THE GO!

because every one is an exact duplicate of those specified for the thousands of White Trucks now operating in the war zones —service that is harder than that **your** trade can give them.

They are demanded because they get every iota of power from every drop of fuel—because they are made of the best materials obtainable, such as non-pit electrodes, Chromite war-service porcelain — because they give, day in and day out, the intensive spark that transforms lifeless, potential energy into brawny power.

You can sell a Reflex for every service. You can guarantee them — safely. Live, progressive dealers that want to make their time worth-while, should write for proposition today.

Temme

SPRINGS FOR ALL CARS

DO all the lame cars drive to *your* door for Temme Springs and other things?

In most good towns, Temme Springs and Temme's Triple Action Service are known to be *as good as gold.*

Hundreds of repairers, who have "banked" on Temme and never lost, are putting up Temme highway signs today.

These signs *will* bring in business. Temme has tried them, so he *knows.* And now he offers *you* what won for him.

Temme Springs *"for all cars"* means just what it says—for all cars *since 1902.* Test us by naming the spring you need. Temme Triple Action Service will have it on the way to you the same day.

"For all cars" means *designed* for all cars to factory specifications. And so good are Temme Springs—so prompt the service—so fair the prices—that dealers in *all* cars now buy from Temme *in preference* to the car maker.

You need these springs, this service, these signs. They will make you money, bring new business, help you build the good reputation you are after.

If you delay you may lose this exclusive proposition. Write or wire us now, saying: "Send Temme Spring Service Station proposition at once."

JOHNSON
Shock Absorber

This is to remind you of the new model of the famous Johnson Shock Absorber—made by us. The only cure for a hard riding car is a pair of Johnsons. Temme Spring Service Stations make good money on them. Write now for our new proposition.

FOUR NEW TRADE APCO MARK NEEDS FOR FORDS

SPINDLE ARM ANTI RATTLERS

The best selling repair part for Ford Cars is without a doubt the spindle arm bushing No. 2714, as this wears out quicker than any other part of the car. It is cheaply replaced, but the steering rod commences to rattle as soon as wear starts, and when you consider that one-sixteenth of an inch play in the bushing means an inch play at the wheel, the necessity of keeping the bushings in condition is doubly apparent. The slightest play in this bushing also causes a disagreeable rattle, and causes the wheels to wobble, which means excessive wear on the tires, besides making the car harder to steer.

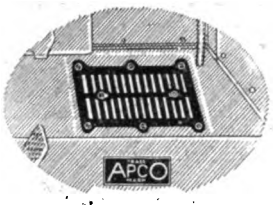
The Apco Silencers consist of two heavy formed springs which can be put on the car in a minute with no tools but the hands. With these on the car, one set of bushings will last two years, and at no time will there be a rattle or play in the steering wheel.

Finished in black enamel, packed one pair in a box, weighing 2 ounces.

40c Pair

TIMER

The Apco Timer gives a hotter, quicker spark, an easier start, more power and speed, smoother running, longer life to the platinum points, more miles to the gallon of gasoline, fewer short circuits and freedom from all those troubles that the regular type timer develops besides being the only renewable Timer on the market. The shell is heavy pressed steel with a single piece steel advance arm riveted on. The contacts are clock spring steel, easily and cheaply replaceable, the insulation is high grade bone fibre. The roller is hardened steel, running on a hardened steel bushing held in a die-casting, which practically eliminates wear. The finish is natural steel. Each Timer is packed in a box weighing eight ounces, and one hundred in a carton weighing fifty pounds.

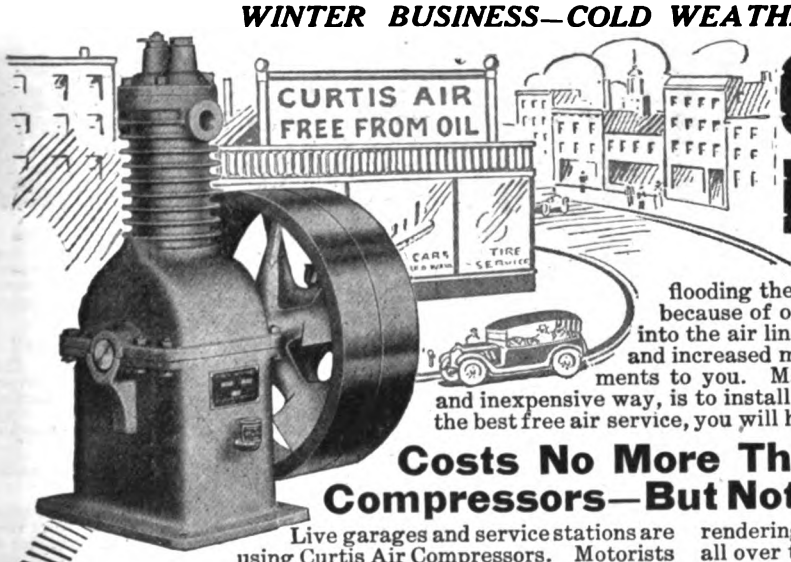


$1.00 Each

BRAKE ADJUSTER

When the Ford emergency brake shoes are half worn out they must be thrown away, as the brake shoe cams do not open the shoes wide enough to engage the drums. The Apco adjusters are driven over the cams when the shoes are worn and this extends the life of the shoes at least fifty per cent. When new shoes are installed the adjusters can be removed and used again. They are made from high grade steel and will last indefinitely, as they are subject to practically no wear.

25c Pair



HEATER

The Ford owner has never been offered a Heater at a price in keeping with his car, and several months ago we decided that it was up to us to produce a real one and at a price that would bring it within reach of all Ford Owners. The APCO heater utilizes the heat that is blown by the fan over the exhaust manifold and this heat is produced in volume sufficient to heat the entire car in the coldest weather, and in moderate weather the heater can be closed with a slight touch of the foot, or adjusted in the same way to any desired point. The installatiion is simply a matter of cutting a hole in the floor board and fastening the Heater in place with four screws.

$1.50 Complete

APCO MANUFACTURING CO., PROVIDENCE, R. I.

WINTER BUSINESS—COLD WEATHER MADE PROFITABLE.

CURTIS AIR FREE FROM OIL

The Curtis Compressor is the only one designed to prevent flooding the cylinder with more oil than it needs for lubrication. This, because of our controlled-splash oiling system. No excess oil is forced into the air line. **Oil ruins tires**—air free from oil means fewer blowouts and increased mileage all around for your customers, with less tire adjustments to you. Make your place the most popular one in town. An easy and inexpensive way, is to install a Curtis Compressor. The customer assumes if you have the best free air service, you will have the best service in all departments.

Costs No More Than Ordinary Compressors—But Note The Difference

Live garages and service stations are using Curtis Air Compressors. Motorists expect free air service. Why not give them the best and win over new customers by supplying, not only reliable air service, but **Curtis Air—Free From Oil.** A poor air system which shoots oil into the tires, or which is unreliable, drives customers away. Thousands of Curtis Outfits are rendering daily, effective, efficient service all over the country. Your Curtis Compressor can further pay for itself by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools, and many other things. Curtis Compressors are backed by manufacturers who have been specialists in this line for twenty-five years.

10 Combinations of Compressor and Tank Sizes—Any Current

Five Sizes—Tight Pulley Only, or Tight and Loose Pulley

11 Combinations of Compressor and Tank Sizes—Any Current

Makes New Customers—Holds Old Ones

Quickly pays for itself in bringing in new trade and holding the old trade, for it not only is the source of a dependable supply of air when your customers want it, but it also supplies clean, cool air—free from oil. Motorists realize that oil will quickly destroy their inner tubes, and, therefore, look for a station that supplies Curtis Air—Free From Oil.

Curtis Compressors are built to meet the requirements of your business in sizes, arrangements and prices. Send coupon at once for full information and attractive prices. It will pay you to investigate our proposition. *Write us today, or ask your jobber for prices—but insist on a Curtis.*

ese Handles
EVER
ork Loose

THE mechanic these days has no time to waste with tools that will not stand up.

Screw-drivers!—handles must not work loose, nor edges turn or crumble under severe usage. They must be tools that save time, enable better and faster work—"Multiply man's power."

"YANKEE"
Plain Screw-drivers

are long-lasting, *efficiency* tools. You simply can't twist the handles loose—because the "YANKEE" is virtually a one-piece screw-driver. They'll withstand the hardest knocks of garage or repair shop work.

Well balanced, and made of the finest tool steel with the precision and care that have made "YANKEE" Tools famous the world over. Highly polished blade and ferrule; dull finish, corrugated hardwood handle, enabling a firm grip.

No. 90—Standard Style, in 15 sizes, 1¼-inch to 30-inch blades.....**20c to $2.00 each**

No. 95—Cabinet Style, in 11 sizes, 2½-inch to 15½-inch blades.....**20c to 70c each**

Guaranteed for
10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

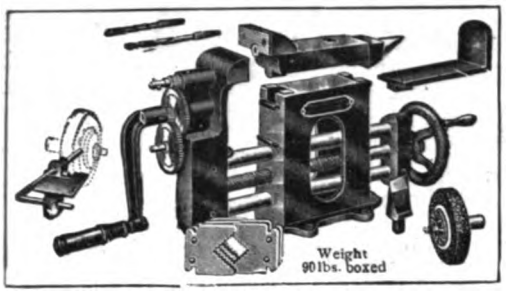
"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER



To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

Stewart Handy Worker
For Public and Private Garage

A Work-shop in Itself

$14 Complete

Here's a wonderful repair outfit—a big, strong, everlasting combination of tools. Six tools in one—would cost $25 at least, if bought separately. Outfit includes strong, practical anvil; powerful vise up to 4½ inches; a sure-grip steel pipe vise, takes up to 1½ inch pipe; corundum grinding wheel 5 inches by 1 inch; a two-speed drill press with 2 drills; a metal cutting wedge and driving mechanism of three speeds—direct, 4 to 1 and 16 to 1—easily regulated by changing handle grip. It operates grinding wheel, buffing wheel and many other similar tools.

SPECIAL OFFER

Send for one of the outfits, remitting $2.00 with your order, pay balance on arrival. If not entirely satisfied in every way, return it and money will be cheerfully refunded.

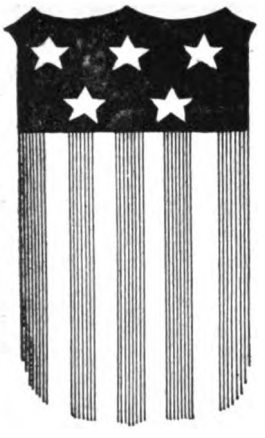
"NORMA"
BALL BEARINGS
(Patented)

The running of a car or truck—its steadiness, its power, its smoothness, its dependability—rest ultimately upon the performance of a hundred component parts. Failure in one of these may destroy that smooth unity which differentiates good performance from unending bother.

Enquire into the dependability of magnetos and lighting generators. Those of demonstrated serviceability, of proved reliability, are standardized on "NORMA" Ball Bearings—have their own inherent superiorities fortified by "NORMA" Bearing speedability.



Be Sure—See that Your Electrical Accessories are "NORMA" Equipped

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

CONNECTICUT

Lighting Switches

are the neatest, simplest and most easily installed equipment of their kind on the market.

Easily operated with a gauntleted hand.

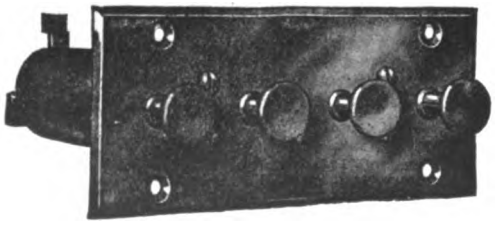
Simple construction insures unending service and satisfaction.

Connecticut switches are designed to provide every arrangement of lighting control that can be desired.

One switch for all lights, individual switches for each, or any choice of functions, individual or in combination.

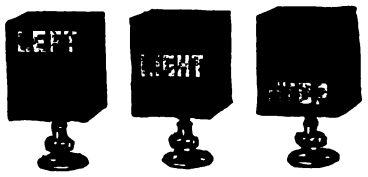
HEADLIGHTS

The use of resistance for dimming the use of double filament bulbs, or the use of large or small bulbs.



HEAD, SIDE AND TAIL LIGHTS

Head and tail lamps on and off together. Side and tail lamps on and off together.



DASH LAMP

Individually or in conjunction with tail light. These are the principal functions of our standard switches but these by no means indicate the limits of control to which we are confined. Every practical arrangement has its switch.

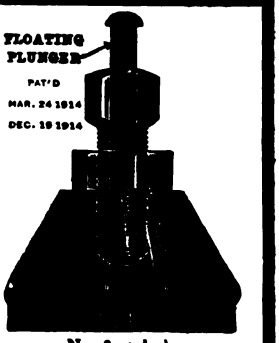
MOSCO SPECIALTIES

Mosco No. 200 Timer for Ford Car



Patented Oct. 31, 1916

The case is made of extra heavy pressed steel, finished in aluminum. Gray bone fibre is used for raceway, with steel inserts dovetailed in and all lathe finished to a polished surface. The threaded terminals are insulated by fibre washers all the way through to contact points, thus removing cause of short circuiting common to this style of Timer.

Price, complete with brush, $1.50 each. Brush assembly only, $0.40 each.

Mosco Floating Plunger Wheel Puller

No. 3 and above

Starts a "Frozen" or "Stuck" wheel instantly. Strike the plunger; turn the screw, strike again and the wheel comes off without injury to hub-threads, spokes or axle.

Made for 200 models of 40 popular cars.

Mosco Socket Nut and Bolt Holder for Ford Car

A REAL TIME SAVING DEVICE. Takes the place of that other man whose help is usually required for this operation.

Simply slip MOSCO Nut and Bolt Holder over the top of each engine or Transmission nut or bolt head, the wings protruding above the hex socket engage wall of crank or transmission case and prevent nut or bolt head from turning while the man underneath the car unscrews the bolts.

POSITION ON CRANK CASE BOLTS

When replacing put head of bolt on top, slip on the MOSCO socket and proceed as in taking out.

Made of heavy pressed steel, with reinforced wings welded to body of socket. All case hardened and finished bright.

PRICE 15c EACH.

Mosco Anti-Rattling Ball Socket for Steering Rod of Ford Car

AN ENTIRELY NEW DESIGN. For taking up the wear and eliminating the rattle on worn ball sockets on both ends of steering gear connecting rod. An occasional packing of hollow hex plug with grease insures proper lubrication, smoother working and reduces wear. Tension of flat spring, which is held in position by head of bolt, prevents the hex plug in end from unscrewing. Slotted in hex end so that adjustment can be made with screw driver or wrench. Made of high grade semi-steel.

PRICE 20 CENTS EACH.

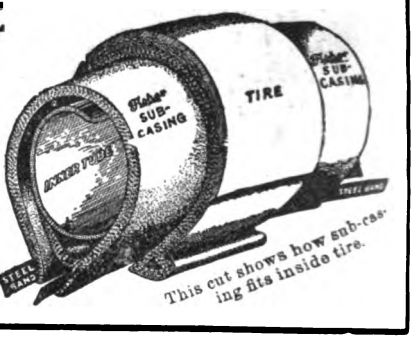
THE Fisher PATENTED "RIM-GRIP" SUB-CASING



MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.

A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

This cut shows how sub-casing fits inside tire.

JEWELL BATTERY GAUGE

The Ever Watchful Guardian of Your Battery

NOT MERELY AN ORNAMENT—AN ACTUAL NECESSITY

Practically every car equipped with a storage battery carries in a conspicuous place, a warning sign directing the owner to inspect the battery at least twice a month.

The JEWEL Battery Gauge tells you constantly with 100% accuracy, everything you need know about your battery and whether your generator is running at full capacity.

It does not wait till the trouble is serious, it warns you before it really begins, in no complication of volts and amperes, but in plain language that he who runs may read.

The quickest selling and most profitable accessory ever offered the dealer and repairman.

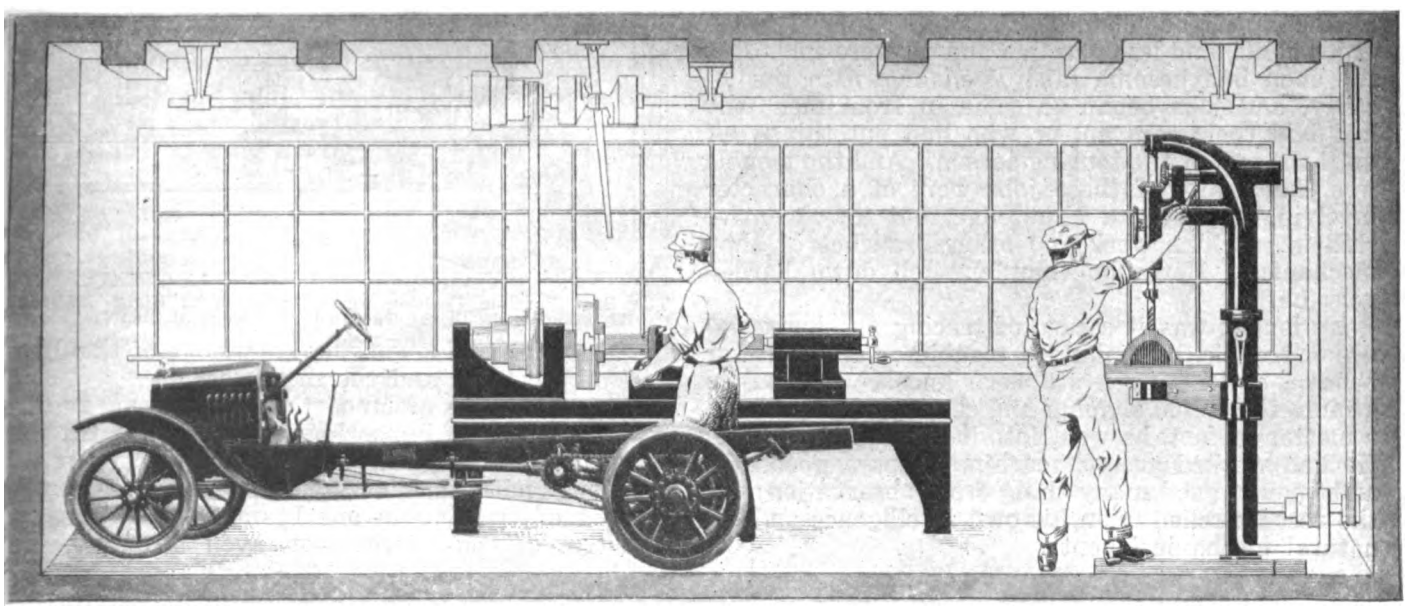
Good Light and Plenty of It the First Requirement of the Successful Repair Shop

Suggestions for Taking Advantage of Natural Light and So Arranging the Machinery and Equipment That Illumination Will Not Be Wasted

BY W. O. MANN, M. E.

The number of beginnings made every day in the automobile repair business is almost as amazing as the daily number of failures of those who have found that for some reason they have been unable to finish what they have started, and they drop out, or are forced out, probably poorer in purse and not much wiser. It is not rare to find that many such unsuccessful men attribute their trouble to outside causes of all kinds, when in reality the reason is an inner reason. In other words, many fail through some fault of their own rather than because there is not enough business, or because of poor location, or any of the well known explanations.

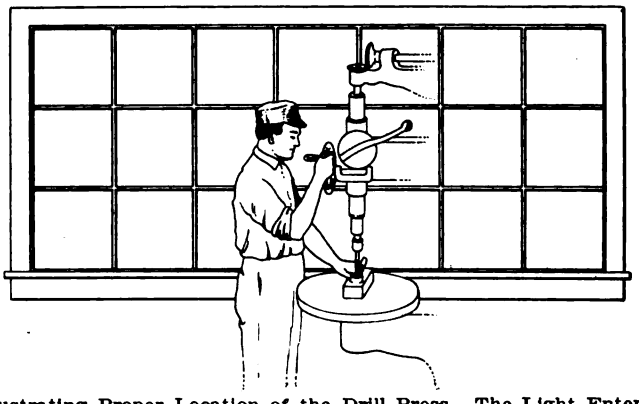
Failures and Successes.



It is not proposed, however, to catalogue the reasons for small failures, nor yet to suggest remedies for all the troubles of the struggling repairman. One might just as well start out to compile an encyclopaedia. Attention is called to the fact, however, that of the many who do not make good, a large proportion fail to pull through by a very narrow margin. Often and often a man might have come through the trying early period with a whole skin if he had had just a little more of something to put on the right side of his books—capital, knowledge, experience, credit, equipment—just a little bit of something the lack of which was sufficient to push his head under water.

Mechanical Knowledge Important.

Now it may be news to some—it assuredly is not to others—that many failures are due to the fact that automobile repair shops are too often started by men with a very small amount of mechanical knowledge, though having perhaps considerable experience with automobiles. For instance, an experienced chauffeur, who knows all makes of cars thoroughly, can make his own diagnoses and adjustments and do practically anything that is required for the ordinary maintenance of a modern car, is very likely to consider himself well fitted for the business of running a repair shop. Sometimes he is. More times he is not. And a great deal of trouble has arisen from the fact that an outsider—one who knows little or nothing about automobile repair work—is tolerably certain to look upon such a chauffeur as even better than he (the chauffeur) thinks himself.



A Team That Didn't Pull.

The point is well illustrated by an actual occurrence. There was a certain rich man who maintained a large estate, and among his numerous employees there was an uncommonly capable chauffeur who

Digitized by Google

had charge of no less than six cars and had two men under him. In course of time this rich man, through one of the flukes for which Wall Street is famous, became poor, and in shedding his estate, he shed the capable chauffeur. Having had a taste of authority, Mr. Chauffeur did not at all like the idea of hunting a job as an ordinary driver. So he

Illustrating Proper Location of the Drill-Press.—The Light Enters at Left of Operator Facing the Machine.

had a number of earnest conferences with the head gardener, who, unfortunately, had saved up considerable money.

Experience vs. Capital.

Usually it is not unfortunate to have saved money; but in this case it was. As a result of these conferences the chauffeur and the gardener decided to go into the automobile repair business, the former putting in his knowledge and experience and the latter his money; both were to work of course. Their capital did not warrant their employing help at first anyway. They were to go share and share alike in whatever profits there might be.

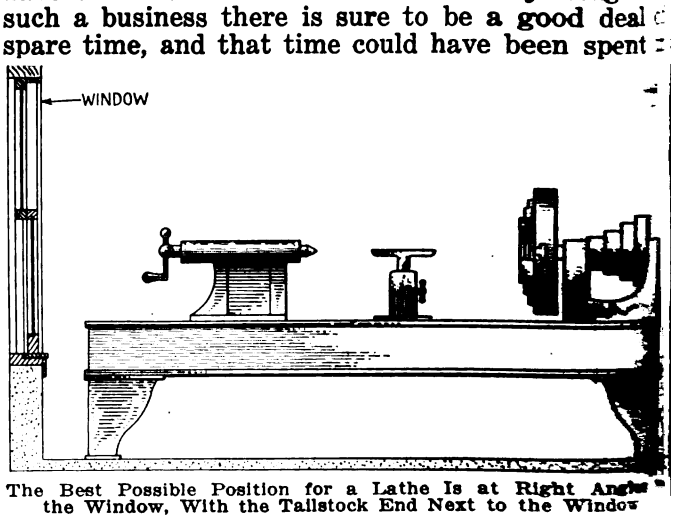
They bought a fairly good equipment of hand tools as a starter and considerable business came their way during the summer in which they opened. As it happened, it was all, or nearly all, of a kind that the one-time chauffeur could handle very well. In addition, they sold a lot of gasoline and oil, did a little trading in second-hand cars and, altogether, felt themselves well started on a career of prosperity.

On the Toboggan.

With the approach of cold weather, however, the character of the business changed. Tourist trade dropped off, and less gasoline and oil were sold. But the shop had become fairly well known in the locality, and jobs began to come in from men who had laid their cars up, or who had put things off until the end of the touring season. And the trouble was that many of these jobs were of a character involving not only a knowledge, but an executive skill in machine work and other branches of shop mechanics. Here the chauffeur fell down hard—very hard.

No longer was it a case of tracing an elusive ignition trouble, or making a troublesome carburetor behave, or locating a stubborn knock. He had to go into the actual shaping and cutting of metal. As a matter of fact, he went into it with all confidence. He had worked around machine shops a good deal and knew a good many thing from observation; for the rest he relied upon his own intelligence and his natural mechanical bent.

The First Difficult Job.



Things happened, one right after another. One of the first jobs offered was the re-bushing of a gear, which is anything but a difficult piece of work for an ordinary machinist. The gear was of steel and ran on a steel stud—an arrangement which not unnaturally resulted in rapid wear. The order was to bore the gear hub, put in a bronze bushing well fitted to a new steel stud, upon which a thread had to be cut. There is no use going into the harrowing details. The chauffeur did manage to bore the gear and put in a bushing; he did manage to scrape a spiral groove on the stud and call it a thread. But the bore was not true and neither was the bushing, and though the fit on the stud seemed snug, it was because it was a trifle tight in one place only. Elsewhere it was loose.

Lathe Proved a Factor.

When the gear was put into service it started by squealing at every revolution; but because there was no bearing to speak of on the stud, it ended by rattling all the time. The owner firmly declined to pay for such work and had the job done at the nearest large town. And this, or something much like it, was the history of job after job. In all his struggles to do work that he did not know how to do, the chauffeur never discovered that the second-hand lathe he had bought was so far out of true that he could not have done accurate work with it even if he had known how! After a winter that must have been an unusually trying one for both partners, the little firm went to the wall, the gardener minus all his capital and the chauffeur minus so much of his self-esteem that he hunted for himself a common chauffeur's job—and he is at it to this day.

What Was Lacking?

That is the story of a very narrow escape. A little appreciation of his own lack of knowledge on the part of the mechanical member would have saved the day, for he was sufficiently intelligent to have remedied that lack. In the early stages of such a business there is sure to be a good deal of spare time, and that time could have been spent

The Best Possible Position for a Lathe Is at Right Angles to the Window, With the Tailstock End Next to the Window

the acquisition of a working knowledge of the handling of the lathe and the drill-press.

It must not be assumed that a man can make a good machinist of himself by any such offhand process as this. Given, however, an intelligent man with a strong natural bent for mechanics, a certain amount of training in one branch and the strong incentive of self-interest—or, even stronger,

preservation—and he can do surprisingly well in the way mentioned. Many old-time machinists are likely to discount this, but it is a fact that a man can fit himself to perform a large proportion of the work involved in automobile repairs in this way. At the same time he acquires something that is of equal

Naked Electric Lights With Unshaded Bulbs Are Wasteful. A Common White-Lined Tin Shade Will Throw as Much Light as Three Naked Bulbs.

importance, and that is the ability to recognize a job that is beyond his skill. What to do with such a job is a matter for the repairer himself to decide; but it is a good start if he learns what to let alone.

What It's All About.

That brings us to a high spot in this subject. If Mr. Chauffeur had had anything at all for a warning and a guide, it is likely that he would have made good. This series of articles is intended to help out those who are more or less in the chauffeur's place, and have the sense to know it.

It is utterly impossible, it may be acknowledged at once, to think of going into all the details of all the work that a repairman is likely to be called upon to do. It is possible, however, to look at matters through the eyes of the man who is starting a repair shop with a small stock of knowledge, and give a good deal of plain, straight information that will make clear many things that are not clear to the average man without mechanical training. Let it be understood very distinctly that this is no attempt to instruct the finished machinist—or even the ordinary machinist, for that matter; it is not a word to the wise, but a word to—let's say the inexperienced. So let the wise ones pass it over with a smile, if they will, for it will be mostly in words of one syllable.

Arrangement Important.

There is no use going into details of shop construction or floor plans or anything of that sort, for the man who is building his own shop will not need this primer talk. Where the small repairman begins is in the arrangement of his property in some shop that he is lucky enough to get already built. It really makes a great deal of difference how things are arranged, and if the reader will bear in mind the aforementioned fact that many failures occur by very narrow margins, he will agree that no detail is so small that it can be overlooked. And again let us repeat that this is a series of first lessons for those who need them.

Light and Plenty of Light.

The first consideration is light in the shop. There are many men who say that they are not particular about having the b... is entirely wrong. there should be as much light as possible where it is needed—on the work.

Naked electric lights with unshaded bulbs are exceedingly wasteful affairs. They shed light in all directions when it should be shed in one direction. Of what use would an automobile headlight be without a reflector: It would throw a feeble gleam in all directions, but no strong light anywhere. It is the same with the naked lamp. It wants a reflector, and there are on the market plenty of metal shades with polished or white enameled linings, which concentrate the light. It is worth knowing that one lamp with a common white-lined tin shade will throw as much light on the work as three naked bulbs at the same distance.

While figuring on lighting requirements, bear in mind that in machine work it often is necessary to cast the light on some part of the work where it will not ordinarily fall. For instance, in doing a boring job on the lathe the light from a pendant lamp is likely to simply throw a shadow on the tool. A fixture that will clamp to the lathe and hold the light in any position is cheap—so cheap that any man who refuses to provide one ought to blush for his parsimony.

A Little Kink.

This may be a good place to mention a little scheme that often is worked and is exceedingly useful. It is merely to use a small mirror to throw a concentrated light on some particular spot where close and careful watching is required. Usually the machinist is content to have the mirror handy and hold it in his hand while using it; but occasionally mirrors have been rigged up on adjustable stands, so that once set, they would throw a steady light. This works equally well with artificial or natural light.

Other Lighting Requirements.

But the machine tools are not the only consideration in figuring on the lighting problem. There must be a bench, or benches, and there must be light on cars brought into the shop for work. Benches are best placed directly facing the windows; indeed, there seems no better way unless there are overhead windows or skylights. The presence of these would of course considerably modify all lighting plans. The car brought into the small shop must necessarily be the last thing considered in the matter of illumination. It is not what might be called a fixed quantity, but is a variable that must take its chances. If the general lighting is as good as possible, and there are good extension lamps, little more can be asked for.

It may be well to add that in an automobile repair shop anything but electric light is practically out of the question. And if there is no electric current available—which is unusual—it is by no means impracticable to rig up a small lighting plant with a little stationary gasoline or kerosene, or even a steam engine, and a second-hand generator, which often can be picked up for a low price. The matter of handling such an electric lighting system will be dealt with at some future time.

Ed. Note.—This is the first of a series of articles dealing with the equipment, operation and maintenance of the repair shop. Each article will be a complete story.

Theft Insurance Not Increased.

The proposed increase in rates for automobile insurance in Detroit, Mich., has been abandoned for the present owing to the obnoxious features incorporated. So many cars have been stolen that the rates for indemnity were advanced partially in Detroit and Wayne County on November 1.

The proposed new rates would increase the insurance on low priced cars 12 per cent., and also carries a 50 per cent. co-insurance clause under which the owner would be obliged to stand half of any loss. Some companies are said to favor the issuance of a policy excluding extra tires, etc., not supplied at the time the car was purchased. The following are the old and new rates:

	Old	New
Cars $790 and under	$3.75	$5.35
Cars $800 to $1,399	3.00	3.85
Cars $1,400 to $2,499	2.00	3.85
Cars $2,500 to $3,499	1.75	2.10
Cars $3,500 and over	1.50	1.85

Show Proceeds for Red Cross.

The American Red Cross Association should be several thousand dollars richer at the closing of the Duluth, Minn., automobile show. The Duluth Automobile Dealers' Association has unanimously voted to donate the entire proceeds of its fourth annual event, which is to be held the week of February 23, to the Red Cross.

EFFECTS BIG SAVING.

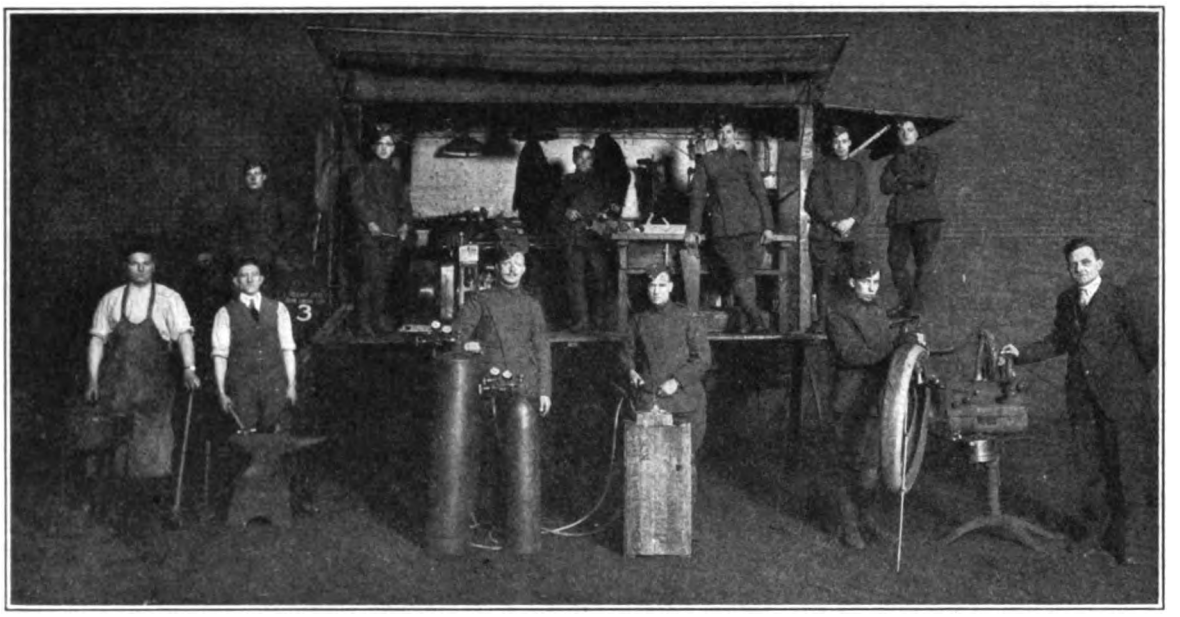
Passenger Car Saves Over $500 in Travelling Costs in One Year.

Figures showing the possibilities of the motor vehicle as a time and money saver have been supplied by the maker of a passenger type of machine. An Indiana business man purchased a car in 1915 for the use of himself and his salesman. During the first year the vehicles saved $511 in operation and maintenance charges over the cost of the previous horse operation, covered 2,000 more miles, brought salesman in contact with 35 per cent. more customers, and increased sales 40 per cent.

During the previous year the party paid $645 in horse and buggy hire, and drove about 5,000 miles. The motor vehicle bought in 1915 was operated 7,000 miles at a cost of $94.70 for oil and fuel, $45 for insurance, and $150 for garaging and a commercial car body, a total of $289. It earned $175 as a truck.

In 1916 the machine was operated 7,300 miles at a cost of $124 for fuel and oil, $120.96 for garaging and $45 for insurance. It earned $225 in that it saved that amount by transporting material that would otherwise have cost money. The car made a better showing the second year. The salesman utilizing it increased his sales 200 per cent., but the owner does not credit the car with all of this gain, stating that about 75 per cent. represents a fair credit to the vehicle.

Use Cars for Business.



A census of passenger cars taken in Livingston County, Ill., among owners of two makes of machines, one selling from $650 to $850, and the other selling at $1,650, revealed that the vehicles were largely used for business purposes.

Of 88 farmer-owners, 63, or 73 per cent., bought their cars as necessary farm equipment; 21, or 25 per cent.. bought them for business and pleasure, while only two said they bought them primarily for pleasure. Asked what percentage of the use of their cars was for business, 22 said 95 per cent.; 20, 90 per cent., and 10 70 per cent. The average of all replies was 82 per cent. The average distance the 88 farmers drove their cars was 2,934 miles a year. Average value of the farms in Livingston County is more than $30,000. Results of the investigation may be considered typical of the way farmers throughout the country use their cars.

EXAMINING MECHANICS.

Recruits Must Pass a Thorough Examination for Aviation Corps.

Thousands of mechanics are required behind the lines to maintain the airplanes in serviceable condition and mechanics applying or enlisting in the Canadian aviation corps must pass a thorough examination before being accepted. The recruits are given an opportunity to demonstrate their efficiency with the various apparatus, as shown by the accompanying illustration. A motor truck is utilized in the work and is completely equipped with a lathe, drill press, etc., also forge, anvil, oxy-acetylene welding equipment, vulcanizer, etc. The examinations are conducted at the Toronto armories.

Mechanics Enlisting With the Canadian Aviation Corps Are Required to Pass an Examination as to Ability, etc. A Motor Truck Carrying a Complete Machine Shop, etc., is Used.

Freight Congestion Delays Tags.

The receipt of motor vehicle license tags at Panama for 1918 has been delayed because of freight congestion in the United States. Pending their arrival, 1917 tags will be recognized as valid by the Canal Zone police.

This is not to be interpreted as authorizing a delay in the payment of license fees for 1918. Receipts are being sent by the Division of Civil Affairs to owners of motor vehicles who have paid for their 1918 licenses, with the information that their 1917 tags may be continued in use upon condition that the operator of the machine carry his 1918 receipt for exhibition to the police if it is asked for. Owners will be allowed until January 15, 1918, to renew their licenses.

Fitting the Insurance Policy to the Garage and Repair Shop

Analyzing the Various Clauses of Different Policies and Factors Invalidating the Policy—Why One Should Read Every Word in Policy

BY FRANK A. FARRINGTON

You know as much as I do about the advisability of carrying fire insurance. You appreciate the importance of having enough fire insurance to protect you and your family against bankruptcy in case of a disastrous conflagration, but do you know all about your insurance? Do you know to a certainty that you will receive from the insurance companies, when your fire comes, the insurance money you are expecting you will get at such a time?

When to Read the Policy.

You can tell off-hand the amount of insurance you are carrying on your buildings and on your stock, but can you tell whether you will get the face value of your policies? In the cold, gray dawn of the morning after, will you be able to look over the premises where you were doing business the day before and say to yourself, "Well, it might have been a good deal worse. I've got enough insurance coming to rebuild?" Or will you then be worrying about certain clauses in your policies that you never noticed until you sat down after the fire to read those very important documents?

It is not that you have reason to doubt the soundness or the ability of your insurance companies to pay their losses, or their honesty and fairness as compared with other companies. Most companies are sound enough and honest enough. It is not that your policies are not perfectly good policies, because, no doubt, they are standard policies recognized and approved by the laws and by the insurance department of your State. The question at the all-important times will be whether you have realized just what your part in the contract was, and whether you have lived up to it.

Must Be in Writing.

The mere fact that your insurance policies are the standard form does not cause your duty to end with paying the premium. You have to do more than pay the agent what he charges you. An insurance policy is a contract, and, like all contracts, it has two parties to it, each of whom must do certain specified things. If you think your policy is going to mean anything more favorable to you than the expressed terms in it indicate, you will be disappointed. You may be able to hold the company on a verbal application to their agent for insurance, but verbal agreements about matters not mentioned in the policy will not count. It must be down in black and white.

Read the Policy.

There is just one proper time for making sure what your policy contains and that is when you accept it, or if you did not do it then, right now. After the fire starts it will be too late to obtain any special permits or to change your warranties. The loss will be adjusted on the existing form of the policy, not on what you thought or hoped it contained, or supposed it said. You would not think of entering into any other form of contract involving thousands of dollars without even reading the contract, fine print and all, but have you read your fire insurance policies?

The Responsibilities.

Find out at once just what your policy promises and just what you promise when you accept it. If you have hitherto neglected this, don't go to bed tonight without making sure of these things, even if you have to get the insurance agent out of bed to make certain of where you stand. Every provision of the policy that puts any responsibility upon you must be kept or the company will refuse to pay, on the ground that you, the assured, have not complied with the provisions of the contract.

See that your policies at all times fit your business and your plant. If you have for a long time been doing business in the same garage with substantially the same building, you may have been simply getting your original forms of policies renewed every year. The first, original policy may have fitted well enough at the time and yet changes in your methods and in your equipment may have rendered that old form of policy absolutely valueless to you. Look this up and if new warranties or permits are needed to make the policy fit, get them inserted before you are a day older. You have to pay a high rate for your insurance, so it is important to see that it actually insures you.

Insure to Cover Losses.

If your policy is only almost right, it is no good at all. An almost good policy is in the same class with an almost good egg. It is poor economy to skimp on the price you pay for insurance. If you cannot afford to pay for the kind of insurance you need, the kind that will cover your losses, you certainly cannot afford to take anything less than that in value.

You may have enough resources outside of your business so that you prefer to insure yourself, saving the premiums and taking the risk of loss. You may regard your building as fireproof and your stock may be scattered in two or three buildings, so you are not afraid of a total loss by one fire. This is, of course, up to you, and no one can know as well as you do how much insurance you ought to carry. But if your capital is all invested in your business it is certainly a wise plan to insure to the limit.

The 80 Per Cent. Clause.

Sometimes a man is tempted to take the reduced rates offered with an 80 per cent. co-insurance clause in a policy. Do you understand what this co-insurance clause does to your policy? If you have a plant worth $10,000 and you take out insurance with the 80 per cent. co-insurance clause for $8,000 and have a fire with a loss of $5,000, you get the $5,000. But

Digitized by Google

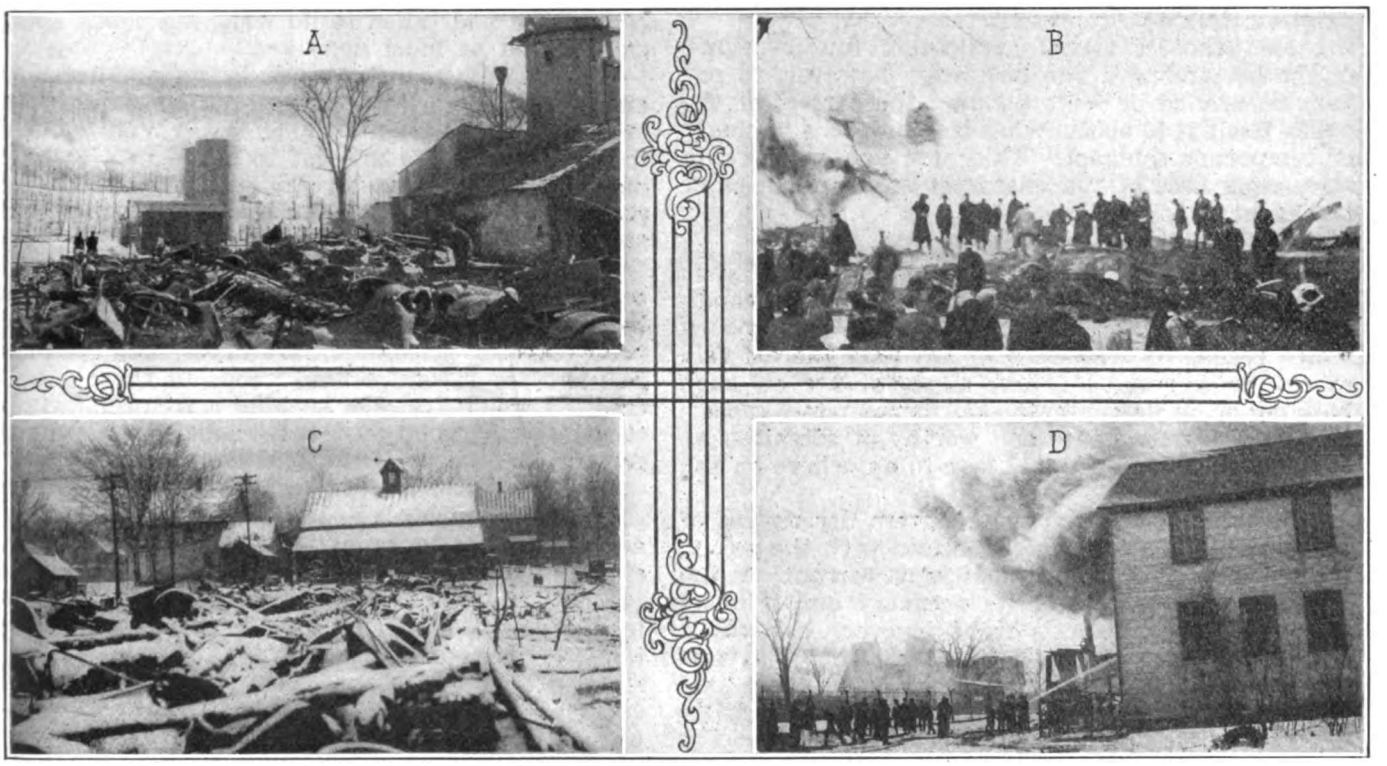
suppose, under that same clause, you take out insurance for less than 80 per cent. of the value of the property, say $7,000. Then, with a $5,000 loss you would receive only seven-eighths of the loss. The insurance paid you would be in proportion to the loss as the insurance carried was in proportion to 80 per cent. of the value of the property insured.

Records, Etc., Must Be Kept.

With this co-insurance clause you must be able to prove that your property was insured up to at least 80 per cent. of its full value. This makes it essential for you to keep, where the fire will not destroy them, inventories and invoices and sales records so you can prove the value of the stock and the amount of the loss. This is very important, however, in the case of any form of insurance. Insurance is to provide indemnity for loss, not to give you a profit, so you must show the loss.

The "old line companies," so called, are properly regarded as the standards of insurance safety, but it does not follow that a small mutual company may not also be safe. Companies which scatter their risks widely, perhaps insuring one garage in a town, or one in a section of the city, will not be likely to meet with large losses in that class of risks. The secret of soundness in an insurance company, after honesty in management, lies in such a distribution of risks that no great fire can wipe out its surplus.

How Rates Are Based.



The rate you pay for standard insurance is based on what the statistics have shown to be the "probabilities" of a fire in your case. Since all companies accept practically the same statistics, it is obvious that the rate charged for your chance of fire will be practically the same in all cases except in those purely mutual companies which reduce the risks by a very wide separation of risks, and perhaps even go so far as to make all their charges by means of assessments as needed.

To the rate charged for the probability of a fire must be added further charges for expenses of operating the company and for the profits to the stockholders. These charges comprise what is known as "loading the policy." Obviously, with the same table of probabilities as a basis, differences in rates must depend upon differences in the "loading" charges.

Avoid Falsification.

Any garage man would know the danger of giving the insurance, along with his application, false data that might influence the rate of premium, or enable him to secure a more favorable policy than he could get on a true representation of the situation. But not every man realizes that the omission, intentional or otherwise, of important information may prove fatal. Omission of part of the facts may be taken as evidence of intent to defraud, thus invalidating the policy. It is necessary to tell all the truth as well as to avoid falsification.

See that everything incorporated in the policy as a part of the warranty you give the company is accurately complied with. For example, there is the "standard chimney warranty" in some states. Are the chimneys in your building so constructed as to comply with the terms of this warranty? If not, have you arranged for permits to cover any exception? Have you put in a short tile chimney somewhere when you wanted a stove temporarily, or have you built a chimney from the "attic" up? Is there a chimney built on a bracket that would not pass inspection? The insurance companies are inclined to be very fussy about chimneys and, for that matter, they have a right to be so. Consult your agent regarding every chimney change.

Concrete Examples of Losses Which Could Have Been Avoided.—A, This Garage Was Partially Covered by Insurance; B, Total Loss Due to Defective Chimney That Failed to Pass Inspection; C, Remains of a Garage the Owner of Which Did Not Believe in Insurance; D, Will You Feel Comfortable When You See the Smoke Coming Out of Your Building Like This?

Digitized by Google

Don't keep more gasoline or other explosive inside of your building than your policy specifically allows. See that you have a lightning clause in the policy. Take out no concurrent insurance in other companies without permission from the companies already insuring you, unless the policy already taken out contains a clause permitting such other insurance.

Is your electric wiring all in shape to pass inspection? The "Standard Electricity Permit" will make interesting reading if you have never read it before. It might possibly make expensive reading if you wait to read it after the fire.

There is a clause in your policy which says that "No one not authorized in writing shall be considered an agent of the company," so it is important for you to do business with a reliable and a properly accredited representative. Don't transact such business with a man of questionable methods, unless you know he is authorized to do business for the company he claims to represent.

I said that a verbal application for insurance might be binding. The best way, however, to put your insurance in force pending the arrival of the policy itself is to obtain what is known as a "binder" or temporary contract. This puts you on the safe side, regardless of the character or carelessness of the agent.

Adjoining Sheds, Etc.

Is there an annex or a shed that is a part of your insured property and that is in tumbledown condition? There is probably a clause in your policy which reads, "If a building or any part thereof fall, except as a result of fire, all insurance on such building or on its contents shall immediately cease." This is a drastic clause and worthy of attention by the man with a shaky, old lean-to anywhere on the premises.

If any kind of a chart or diagram descriptive of your premises is used in connection with the policy, bear in mind that as a part of your warranty to the company, you guarantee its accuracy and it is up to you to see that it is right in every particular. Your policy will be no better than that diagram, just as a chain is no stronger than its weakest link.

Don't assign your insurance policy to anyone without first getting permission from the company. The policy is very explicit about this and a form for permission as well as for assignment appears on the back of most policies.

Be careful to take up with your agent as they come up, such matters as the introduction of an illuminating gas plant into any building, the placing of a chattel mortgage upon any property insured, the reduction in any way of your own interest in any of the property to anything less than full ownership, the increase in your fire risk by any means within your knowledge.

If you want to make sure that your policy covers certain things ordinarily excepted, have them specifically incorporated. Among these are property in storage or there for repairs; accounts, securities and currency; awnings; office furniture and fixtures; signs. Don't "guess" that these or other uncertain items are covered. Guesswork in insurance is expensive.

Place Losses in Writing.

When you do have a fire there are certain things you need to do. When the fire is put out, make it your business to protect the remaining property from further loss. Make out an inventory of the property. Get the damaged premises into the best possible condition. Notify the insurance company in writing of the loss.

The insurance policy provides that a sworn proof of loss must be sent to the company within 60 days of the date of the fire. The agent will supply you with the proper blank form and help you to fill it out if you wish. In this "Proof of Loss" blank there is a clause like this: "It is expressly understood that the furnishing of this proof of loss blank to the assured, or assistance in making up the proofs by an adjuster or person otherwise an agent of the company, is an act of courtesy and is not a waiver of the rights of the said company."

When Insured Lost Out.

One business man neglected these proofs, thinking something less than a sworn proof was sufficient. He sued five companies and lost every case because he had failed to do what his policy specifically stated he must do.

We have all heard more or less about fire insurance companies trying to get out of paying their losses, escaping on a technicality. Well, we have to admit that they are apt to settle in a technical manner, but that is all the more reason for the policyholder seeing that he understands the situation and lives up to his part of it.

There are thousands of garage men who have only their fire insurance standing between them and bankruptcy in case of a total fire loss, and a large percentage of these men have never even read their policies. If I were selling goods to these men on credit, I would feel like sending a representative to them at once to go over their policies with them—for my own safety if not for theirs.

Read Every Word in Policy.

Read your policy. Read it from beginning to end and take time to read it intelligently and understandingly. If there is anything about it that you fail to understand, get the agent of the company to make it clear. Don't remain in doubt and don't take anything for granted that is not explicitly stated in the policy. Remember that your policy expires on the stroke of the hour. A fire five minutes after the policy expires will no more be covered by that policy than a fire a year after its expiration.

Of course, you know your fire insurance policy does not cover loss by war, insurrection, riot or usurpation of power by military authorities. If you want protection under such conditions, you will have to secure it in some other way than through the ordinary insurance channels.

Garagemen and Tractor.

The Federal and State employment service men at the interstate and federal conference held recently at Kansas City, Mo., expressed the hope that garagemen would as early as possible get in touch with the farmers, learn their equipment and arrange for handling all work, particularly emergency repairs. The Commissioners pointed out that only through the fullest co-operation from garagemen could the labor employed in connection with tractor operation on farms be used to the most economical advantage. The commissioners do not believe it will be essential for any repairman to leave his work to render aid to a farmer in the field.

Preventing Leaks in Government's Post Office Garage at St. Louis

BY JAMES F. HOBART, M. E.

The United States post office at St. Louis, Mo., operates a garage in which 60 cars are stored. The garage, an imposing one-story structure, was built three years ago by the Government.

About two or three years ago the automobile question was "dumped" upon the post office department without warning. Since that time the department has been slowly digging itself out from in under the "snow-slide." Contracts were made at that time for the use of and maintenance of cars, but as they expire they are not renewed. The department now takes over both the automobiles and their upkeep.

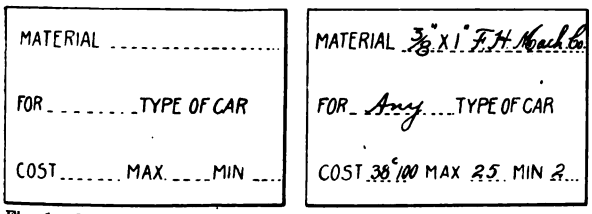

Fig. 1. Material Slip Used for Keeping Track of Stock Including Parts, etc., Issued by Stock Room.

Types of Cars Used.

Of the 60 cars cared for in this garage, 20 are the product of the General Motors Co. Of these 14 are of ¾-ton capacity and six 1½-ton capacity. There are four ½-ton Studebaker trucks and 36 Fords. The cars enter the garage at A and leave at U, as shown at Fig. 2. There is never any confusion during the entrance and exit of vehicles.

Plan of Garage.

Each car is stopped just inside the door and is not allowed to proceed until its fuel supply is renewed and to capacity. This avoids the possibility of a car leaving, no matter how hurriedly it may go, without its full complement of gasoline. Should a car be run out and around the block its fuel supply must be renewed as it enters as though the car had been out all day.

A very strict account is kept of each car and its driver, and every drop of gasoline and oil used, as well as every bolt, nut, cotter pin, etc., is charged up to be accounted for.

After entering, the car is parked in its particular place whenever it is possible. Otherwise the car parks where convenient. All the solid tire cars must park on the space CC, which is reserved for that class of vehicles. The other cars, those with pneumatic tires, park where they can find room, their own places preferred, and at all times the spaces DD are kept as clear as possible in order that room may be had for inflating tires, making minor repairs, etc., before the cars proceed to their places.

The inflation of tires is done in spaces DD, the air pipes being brought down the two posts as indicated at EE from the air compressor which is located in the shop at M. It will be noted that there are very few posts in this garage, the roof being supported upon the four posts shown at EE, GG. The beams between the posts are carried upon rod trusses about 50 feet long.

The section of roof between the two lines of trusses is covered by a "lantern" or monitor which gives plenty of light to the central portion of the garage. This, together with that from the very large windows in the front and rear walls, lights the garage evenly and fully.

The Paint Shop.

A wooden partition, HL, separates the paint shop from the machine shop. A canvas curtain, I, dropped from the roof to the floor, cuts off the garage from the paint shop, which can be very readily entered by vehicles by simply lifting that part of the curtain which is opposite the place where the car desires to enter. Thus dust is kept out of the paint shop and cars can enter almost anywhere without the trouble of opening doors.

The shop, which is separated from the garage by the short partition I, has an air compressor at M, and a fine radial drill stands at N. A bench stands against the cross partition at O, and the screw-cutting lathe P is by the window where the light is good. The emery grinder is located at Q, the forge at R, the anvil at S, and the remainder of the shop space K is used for repairing and overhauling.

The doors TT opening on the alley are never used and are kept locked. Door V is kept locked under the present arrangements. All entrances and exits are made through A and U, respectively, save through the office shown at the extreme left of X.

Depreciation and Accounting.

In addition to a very exacting system of accounting there is also a very fine depreciation system which is followed as closely as possible, 25 per cent. per year being charged off each year.

Repairs and Painting.

The repair policy followed is an exceedingly simple one. Each and every repair or renewal is made just as soon as its need is discovered. If drivers do not report needed repairs immediately they are apt to have a bad quarter of an hour explaining matters to the garage superintendent.

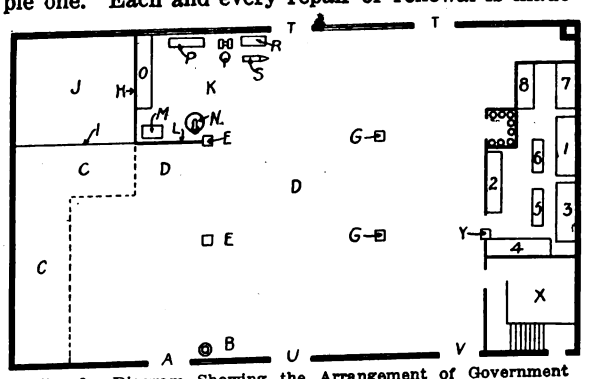

Fig. 2. Diagram Showing the Arrangement of Government Garage at St. Louis, Figures and Letters Indicating Spaces, Equipment, Stock Room, etc.

Digitized by Google

When an engine needs overhauling the entire car is sent through the repair shop and painted. All of the old paint is removed. Thus the cars cared for are always spick and span. They give the best of service under very exacting requirements.

Duplicate Rear Ends.

Duplicate parts are kept in stock so that no time is lost in making repairs and renewals. Six Ford rear ends are kept in stock all the time, and the mechanics use these as "knitting work" which can be picked up and carried on while other work is not pressing. Thus there is one extra rear end on hand for each of the six Fords. When anything is found to be the matter with a rear axle, gears or any other part of it, the old rear end is removed, another put in its place and the car put back into service again in about an hour's time. Without the extra rear ends a car might be out of service a considerable time while repairs or adjustments were being made to the rear portion.

Method of Using Tires.

Each car using pneumatics is fitted and charged with six tires. One extra tire is carried and the others stored in a rack in the tire repair department. The rack which carries all the extra tires is indicated at 7 and the vulcanizing bench is shown at 8. When a tire goes bad the driver replaces it with the extra member. Upon returning to the garage, the extra tire is taken from the rack 7 and carried while the damaged tire is being repaired. After the old tire has been repaired it is placed upon its wheel again and the tire taken from the wheel is carried as a spare. The other extra tire is returned to the store room rack. With this method a set of tires is worn out and replaced with new ones.

The Stock Room.

As shown by Fig. 2, one end of the garage is given over for stock room and office purposes. The office space X is equipped with all that a superintendent needs in the way of fixtures, filing cabinets, etc. The stock room occupies the balance of the end of the building save a small space at W, where the heating apparatus for the building is located. The boiler supplying the steam radiators throughout the building is connected to a built-in-the-wall chimney in the extreme corner of the outer walls.

Tools and parts are given out through the door and window Y, and all oil is stored in the room Z. Every drop is charged to the cars with the exception of the small quantity used in the machine shop.

Racks or units of bins are provided for spare parts. The racks and space shown by the figure 4 are exceptions. Space 1 is made with large compartments and contains the large parts for all makes of cars, while 4 contains the parts used in common by all of the cars.

Each of the other storage cases, which by the way were converted from disused carrier stands, is used for the parts of a single make of car. The Ford small parts are kept in case 5 convenient to the window Y. The G. M. C. parts are stored at 3, the Studebaker at 5, while tools and other necessary material are placed in racks 2 and 6.

Accounting Methods.

A very thorough and comprehensive system is in use for keeping track of the cost of repairs, operating expenses, etc., of each car. Each compartment of the stock racks has a label or tag showing the contents, cost, etc.

For example: On the front of each compartment in rack 4, which contains the parts used on all the cars, will be found a label similar to that shown by Fig. 1. Each label is filled out in accordance with the article contained in that particular compartment. The one devoted to 3/8 x 1-inch flat head machine screws will be found filled out as shown. The last line on the label gives information which the stock clerk is interested in. The cost is entered against each and every car to which one of these screws is delivered, also the maximum and minimum number which shall be carried in the compartment. In this case the maximum number is 25 and the minimum number 2. When the stock clerk finds but two pieces remain another lot is at once placed in the compartment.

It was considered allowable, when the scheme was outlined to allow a maximum quantity of 30 of these machine screws, but the system is to be changed so as to allow a maximum number equal to that in which the specified article may be purchased. For example: Screws come in lots of 100 each. Therefore, the label will be changed to read 100 instead of 30.

In issuing parts the stock man uses an ordinary cash sales machine in which two slips of paper are fed continuously with carbon paper interposed between the slips. Frequently the carbon transfer material is coated upon the back of the top slip of paper. The date, car number (each car owned by the Government is given a distinct number), time, labor, material, oil, driver; in fact, all expense is entered.

On the double slip is entered the name of the material issued, the number thereof and its cost. The stock man allows the slip to remain in the machine, after a piece has been drawn, in expectation that other parts will be drawn in a short time. This usually enables the stock man to list all the parts upon a single pair of slips.

Should some article be drawn for some other car the stock man tears off the slips already marked and starts a new pair of slips. If more parts are wanted for the first car new slips are made out for the car.

One slip of each pair is sent across the street to the postmaster. The other or duplicate slip is kept on file in the superintendent's office for the purpose of checking stock when necessary. A statistician in the post office building compiles the quantities from each slip and charges them against the cars for which they were issued. The garage superintendent is thus relieved of all this routine business.

Stock is taken once each month in the stock room. The statistician checks against each stock report the previous report, purchases and articles supplied each car. Should there be any discrepancy a search is instituted among the stock racks and the charge slips. The stock man is held responsible for the missing material and pays for the same. Very few parts are ever lost or stolen from this stock room.

Stars Added to Goodrich Flag.

Enlistments have followed rapidly at the plant of The B. F. Goodrich Rubber Co., Akron, O. To date 1,624 men have gone from various departments. Almost every day brings an increase. Recently the company hoisted a service flag containing 1,414 stars and has had to lower it twice to affix new stars.

Prevents Short Circuiting of Ford Magneto Contact Assembly

A trouble sometimes encountered by Ford owners is the short circuiting of the low-tension magneto current, owing to foreign matter becoming lodged between the current pick-up point and spring, carried by the magneto fibre plug on the top of the transmission cover, and the metal of the upper part of the crank case.

It should be explained that the current of the Ford magneto is collected from all the stationary spools by a stud attached to the spool unit, and that upon the top of this stud—as shown in the sketch at A on the left of the accompanying illustration—rests a steel spike, the shaft of which is surrounded by a helical spring that passes up into the interior of the fibre plug held by three screws to the transmission cover.

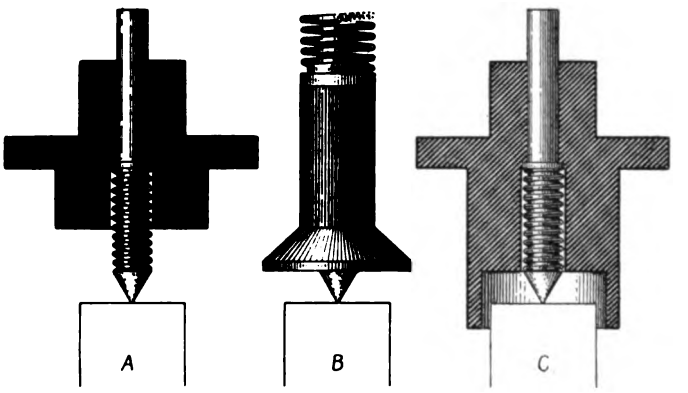
Construction of Unit.

The spool unit is insulated from the metal of the engine, and the current has to pass through the stud to the spike and spring, and thence, by way of a terminal on the top of the fibre plug, through the wire leading from the plug to the coil box. Any leakage of current between the plug and the engine frame, or between the spike and spring above the plug and the frame, results at the best in reduced efficiency of the ignition and at the worst in a sudden and entire cessation of the current at the sparking plug points, says a writer in the Autocar.

Why Deposits Gather.

On the Ford car there is no special protection for the current pick-up stud or for the spike resting upon it, and there is always the chance of foreign matter, such as small fragments of the material with which the transmission brake bands are lined, being swept up in the oil and deposited in the comparatively narrow space between the metal of the crank chamber and the stud and spike above it. When this occurs current leakage often takes place across the bridge so formed.

Some considerable degree of protection at this point is provided by the Rejax (an English device) shielded magneto contact, shown at B. This device forms an attachment to the standard fibre plug, illustrated in the left-hand sketch, on the transmission cover. In order to fit the shielded contact, the fibre plug is removed and the spring and spike are taken out. The spring is then cut short, and one end is hooked round a recess prepared for its reception in the upper extremity of the Rejax fitting. The short spring with the fitting attached is then reinserted in the center of the fibre plug, and the plug itself is replaced in the transmission cover.



Is Shielded by Sleeve.

It will be seen that the lower end of the Rejax contact, which is made of vulcanite, comes down and rests upon the top of the current pick-up stud, so that the point of the contact itself is completely shielded by the vulcanite sleeve. The result is that no short circuiting can take place between the metal of the engine and the contact point, which is spring-supported from within the sleeve. To this extent, then, the Rejax fitting shows a marked improvement over the standard Ford arrangement, but the protection afforded is only to the contact point, and not to the current pick-up stud below it.

Shields Parts.

Another writer suggests that all risk of short-circuiting between the stud and the engine frame could be eliminated by the construction of a fibre plug to take the place of the standard Ford fitting and shaped in the manner shown in the sketch at C.

It will be observed that the portion of the plug below the flange through which pass the screws attaching it to the transmission cover is continued downward, so that it entirely shields the spring and the contact spike that rests upon the current pick-up stud. A further extension of the lower part of the fibre plug acts as a skirt, which surrounds the stud itself and passes down to the bottom of the last-named, thus effectually checking the design of any foreign matter that may endeavor to lodge itself between the stud and the engine frame.

Ford Magneto Terminal Contacts: A, Standard Type; B, Rejax Shielded Contact; C, Suggested Design.

Has Possibilities.

The idea is practical, and, in view of the fact that the expense of manufacturing a plug of this pattern should be very slight, there should be a good market for it among owners of Ford cars.

Those Ford owners who have not made a study of the Ford ignition system are sometimes held up on the road through short circuiting at the point referred to, and much waste of time is caused because the driver has not realized that the contact point and stud, which are normally out of sight within the transmission case, represent a possible source of ignition failure.

An Engine Record.

What is believed to be a record for constructing an engine is that made by the Northway Motor & Mfg. Co. Drawings were given the company for the engine, a Class "AA" truck engine, and on November 27, at 6 p. m., the order and layout were given to Northway engineer. The complete engine was weighed and photographed at 9.30 p. m. December 9. Two hours later it was running on its dynamometer test. The actual time, 11 days and one hour. This is said to better the record made in the construction of engines for the other Liberty trucks.

How Randy Smith, Garageman, Made Use of the Letter Salesman

Randy Smith's garage business had been marking time for several months and Randy had decided it must be gingered. "You stay here and look after things," he said one morning to a 20 year old assistant. "I'll go out and drum up trade."

The first fellow Randy dropped in on was a jeweler who had two cars and who used to stop at Randy's now and then for gasoline. When Randy entered the jewelry store the proprietor was showing a La-Valliere to a well-dressed young lady. A clerk came forward but Randy waved him back, indicating he wanted to talk to the boss. It was 25 minutes, however, before the lady customer passed out. She didn't buy a thing. So when Randy sidled up to the show case the proprietor wasn't in any too happy frame of mind.

Randy wasn't recognized at first. He was taken for a customer. So he had to introduce himself. This made him feel awkward. But he handed out the best line of talk he had. In five minutes he got the jeweler to talking about tires, and Randy was smiling inwardly. Then the telephone rang.

First Call a Failure.

The telephone talk took five minutes by Randy's watch. Worst of all, there was some kind of bad news involved. It sounded to Randy as though some fellow had bought an expensive watch for a girl for Christmas, that the watch wouldn't run and that the girl had called his attention to the fact, causing an embarrassing situation.

The jeweler was "riled" when he hung up the receiver and before he would talk to Randy again he sent a "hot" telegram to the watch jobbers. When he came back to the show case, his mind was clearly off tires and repairs and Randy saw further talk was in vain. He bid good morning and walked out. Fifty-five minutes wasted here.

Second Call a Loss of Time.

Randy drove four blocks down the street and then two blocks to the right. He was on the trail of Jones and Pixley, attorneys. There was a time, not so long ago, either, when Jones was a good customer. When Randy stepped into the office there was an air of bustle and business. A girl stopped clicking her typewriter to answer Randy's questions. Yes, Mr. Jones was in, but it would be fully 20 minutes before he could see him. It usually took Jones that long to answer his morning mail. There were two people waiting to see Mr. Jones besides. If it were an urgent personal call, the girl would gladly call Mr. Jones, but otherwise Mr. Smith would have to leave a message with her, or make an appointment, take his turn or talk to one of the younger members of the firm.

Randy couldn't wait and he couldn't very well leave a message, so he departed dejectedly.

Third Prospect Was Ill.

Now there was a Mrs. Lynch who has owned two gasoline cars and an electric. She had stopped once at the shop one day to talk cord tires, but Randy was not in at the time. Randy thought this was a good time to see her again. So he drove two miles to the fashionable residential district. A prim servant answered his ring at the Lynch home. Sorry, but Mrs. Lynch was not up yet—bad headache! If the gentleman wanted to see her personally he had better make an appointment for the next day as Mrs. Lynch's headaches generally lasted several hours. Randy didn't make an appointment.

And in the Meantime.

It was noon before Randy breezed back to the shop. He saw at once that something had gone wrong. Yes, Frank Wise, one of his best customers, had had a bad collision—car pretty badly smashed up, etc., needed overhauling and a complete set of new tires. Mr. Wise had even talked of buying a new car.

"I was afraid to make a price, the machine was so banged up," apologized the boy. "I tried my best to locate you by phone, but couldn't. Mr. Wise said he was leaving town for 10 days and wanted the car when he returned. I'm afraid he went elsewhere."

To make things worse, young Dickson, of the Country Club, had paused to get a price on some new tires and left when he found Randy was out.

Salesman to the Rescue.

Randy could contain himself no longer. He exploded, and in loud fashion, too. In the midst of his declamation George Lane, an accessory salesman, arrived on the scene. He listened sympathetically to Randy's lamentations.

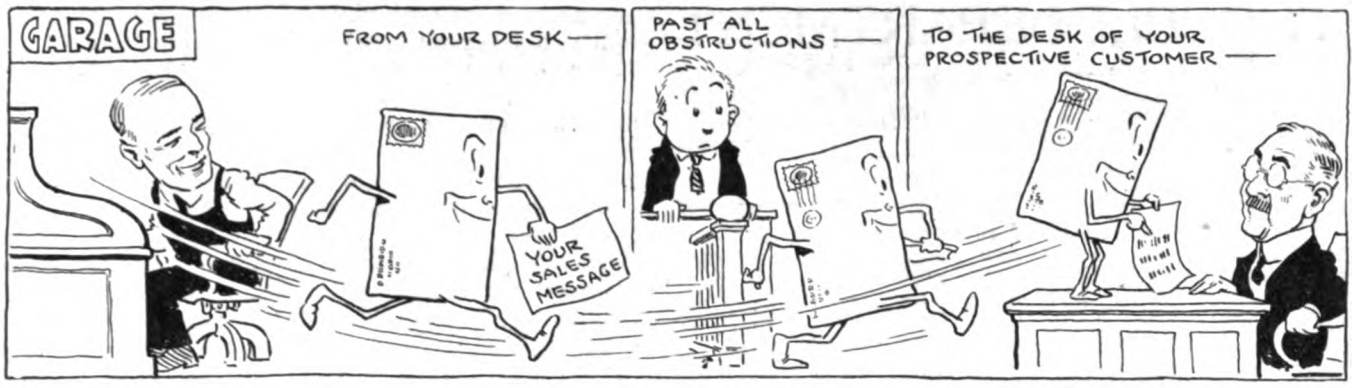
"Randy," he said, "you're foolish to make trips like that. Why do you do it? Your place is right here. Why don't you send a representative?"

"Whom do you mean—this kid here?" replied Randy scornfully.

"No, a letter salesman," said Lane.

"Most people don't realize the value of a letter," continued Lane. "Why, Randy, you can say the very same thing in a letter that you can say personally. And, better still, a letter gets into a man's private office—right onto his desk. And it usually has a chance to talk to him when his mind is fresh and clear. Most people open their mail first thing in the morning.

"Then, again, your letter doesn't peeve a man by taking up his time. And it doesn't take your time, either. It travels while you sleep and works while you go on with your business.



"It is a mighty cheap proposition, too," he concluded. "You figure you lost $40 this morning by not being on the job. For that $40 you could have sent nearly 1,700 letters. Think of that! Or you could have sent 500 letters and used the rest in advertising. And every one of your letters would have talked to its man or woman in private office or boudoir first thing in the morning."

That sounded convincing.

Letters Lacked the Punch.

When Lane left, Randy tried his hand at writing some letters. But he was out of practice in writing and the letters didn't say what he wanted them to say. Besides, he didn't have a typewriter and

Digitized by Google

he realized that copying would be expensive. Then he remembered a salesman of the B. F. Goodrich Rubber Company who told him about the help given by the company in letter writing. Randy consulted the corporation. He was told that Goodrich would not only write or help him write his letters, but would multigraph them, put them in envelopes all ready for mailing. All Randy would have to do would be to pay the postage.

How the Scheme Worked.

Randy's first mailing list was 100 people. Letters went out to this list. Five days later another batch of letters, differently worded, went out to the same people. And after another five days another batch went out, all bright, snappy letter salesmen. They carried the conclusive message—a clear, straight-out-and-out invitation to visit Randy's garage and be assured of prompt service, full money values and attention.

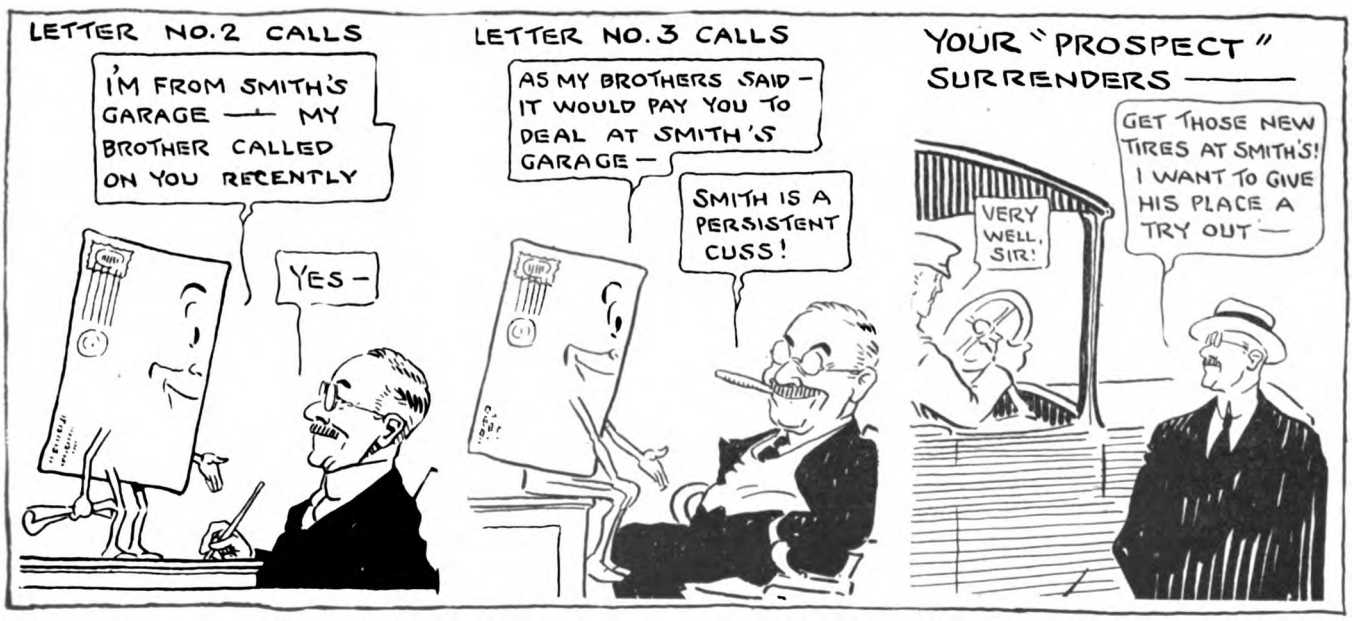
This was the beginning of Randy's first direct-by-mail and newspaper campaign.

Lane, the salesman, happened around a few months afterwards. He found five machines outside the shop. He found Randy's staff doubled—a stenographer annexed.

Randy was directing a repair job, but he broke away when he saw Lane.

"Your hunch on those letters was a peach," he exulted, slapping Lane on the back. "Why I found a bunch of car owners who didn't know I was on the face of the earth.

"I tell you, George, I'm going to follow your tips hereafter. I'm going to let my letter salesmen continue my soliciting. I'm going in more and more for advertising. I find that you can get a lot of help from manufacturers if you'll only go after it. I'm planning now to dress up my windows, have my walls painted, put in signs and cards—touring bureau cards; I find most autoists come in for them—and play the game in a big way."



Every dealer can do the same.

Exempts Garages from Fuel Order.

Fuel Administrator Garfield has ruled that garages are public utilities, and as such are exempt from the provisions of the Monday closing order. Garages may remain open, at least to the extent necessary to allow owners to secure their cars. The ruling is the result of energetic protests made by professional men, such as doctors, who could not obtain their machines when same were stored on the floors requiring the service of elevators. These conditions obtained in the large cities, principally New York, Chicago and Boston.

Has 17 Per Cent. in Service.

The Locomobile Company of America, Bridgeport, Conn., maker of the Locomobile cars, has 336 men in the country's service. This is about 17 per cent. of the entire organization, and includes 19 commissioned officers in the army and three in the navy.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2339 Will Reduce Efficiency.

From E. Huntley, Ohio.—I have a small electric motor rated at two horsepower, 1,200 r.p.m., 250 volts, bi-polar, which I belted to a gas engine, using same for lighting and small power purposes. I used a double throw switch on the board so I could use current from the town plant or from my own generator. I used a home-made resistance in series with the field coils to regulate the voltage. The machine is shunt wound. The town current has now been changed to 110 volts and I am writing to ask how I can alter the machine to develop 110 volts instead of 250. Can I do this without greatly reducing the capacity of the generator?

Reply.—You can use the machine, but the efficiency will be greatly reduced, about one-half, as the speed, horsepower, torque, etc., will be affected to the extent above stated. The better way would be to utilize a machine adapted to the new voltage.

2340 Testing Ford Coils and Magnets.

From W. L. Crum, Illinois.—Some time ago I read some place complete instructions for testing out the Ford magneto, but have since been unable to locate it, but think possibly it was in your magazine. If so, will you please advise me what issue it was in and if not could you furnish the desired information? I would like to know how I can tell whether the trouble is in the magnets or the windings or both. I have the article on recharging Ford magnets in the January issue at hand, but this does not tell how to tell if the magnets are weak or strong or how to test out the coils.

I also notice that D. C. Bays, Colorado, says that he overcame fouling of plugs by grinding the upper edge of the rings off. I know some mechanics who advocate the grinding off of the lower edge instead of the upper. Which is correct or would not both have the result of leaving a sort of vacuum and have the same result? I should think that grinding the upper edge would tend to let the compression escape more than the lower edge.

Reply.—We regret that we have not the issue in question as the number is exhausted. The magnets can be tested by noting if they will support a block of iron, equal to their weight. If not, it will probably be necessary to install new ones.

The coils can be tested for grounds by pulling off the ground connection of the magneto coil assembly and using testing wires with current taken from a 110-volt circuit. The current should be led through a 32-candlepower carbon lamp to prevent an excessive flow of electricity. Sometimes several of the bulbs are used in parallel so as to permit of a greater flow of current, the idea being that a small ground can be burned away. An air blast is sometimes used to blow out any dirt or metallic particles causing the ground and which may collect between the coils and the steel corners. A special insulating varnish should be used to protect any exposed metal discovered and the cause of the ground. A complete story dealing with the work will be published in the near future.

Relative to the grinding of the edges of the rings, the accepted practice is to bevel the lower section of edge. The method described and illustrated in answer to No. 2289 in the December issue is held to be superior to either.

2341 Bosch Dynamo Circuit.

From Frank Cais, Colorado.—Please help me explain the circuit diagram on Bosch starting system which I enclose. Either I must be wrong or the diagram is wrong. A book I have on starting and lighting systems has the diagram which shows the method of current regulation by a ballast of bucking coil which imposes resistance to weaken the magnetic field and keeps the output of the generator reasonably constant. Now I start by positive — brush on generator, go through shunt fields to terminal 2 on generator to 2 on control box, thence through field fuse, potential winding on cutout to — B to 3 to 3 on generator. And then to — brush, this completing the circuit. Am I right?

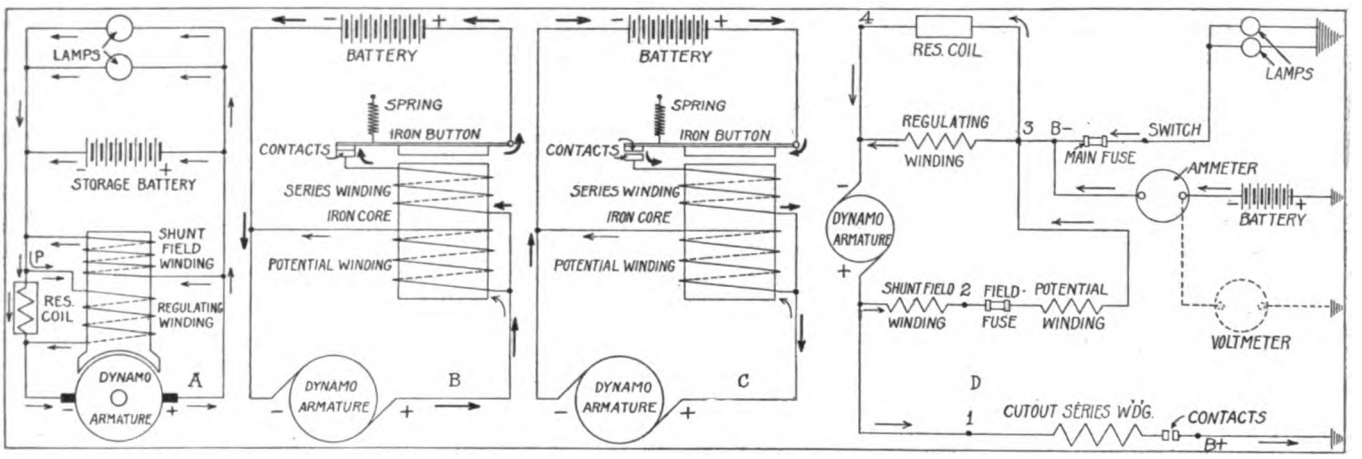
Now when the voltage is high enough the cutout points are closed and current flows from positive + brush to positive + 1 on generator to 1 on control box, through series winding, through the closed points to + B on control B to + on battery, through battery to ammeter to — B on control B to 3, then to 3 on generator and to — brush. Am I right?

Now at the same time current is flowing from 3 on control box through the resistance to 4 on control box to 4 on generator, through bucking field to — brush. I cannot see regulation in this. What is the use of having the bucking coil and resistance in series? I think they should be parallel and when the resistance coil is hot the current should go through the bucking coil. I will appreciate any explanation. Thank you for your answer on piston travel, etc.

Reply.—The current flow of the dynamo is shown in the accompanying illustration at A and the complete circuit diagram at D. B and C shows the bucking coil method of regulation referred to. The dynamo has two field windings, a shunt and a regulating winding. The last named is so placed in relation to the shunt field winding that when a current is allowed to flow through, it tends to lessen or dampen the magnetism created at the field pieces by the shunt field winding.

The flow of the current through the regulating winding is controlled by a resistance inserted in parallel with that winding, and so placed that when the current output of the dynamo tends to increase beyond a certain point, the resistance increases to a

Digitized by Google



point where a current is allowed to flow through the regulating winding, reducing the magnetic strength at the field poles. As the output of the dynamo depends upon this, as well as its speed or rotation, any reduction of the magnetic strength results in a corresponding reduction in the output of the dynamo. This reduction permits of the controlling resistance condition to return to normal, but should the output tend to increase, the series of changes described is repeated, resulting in holding the output practically constant irrespective of the speed.

This method of regulation is illustrated by the circuit diagram at A. The current leaves the armature at the positive + lead, and flows along this wire to the battery. One end of the shunt field is connected to this wire. The current flows through the battery, out of the negative — terminal, and, beginning at the point P, has two paths it can take. One is through the resistance coil, and the other through the regulating winding. The current then returns to the dynamo by means of the negative — lead. The negative — end of the shunt field winding is connected to the lead that connects the negative — terminal of the battery to the point marked P.

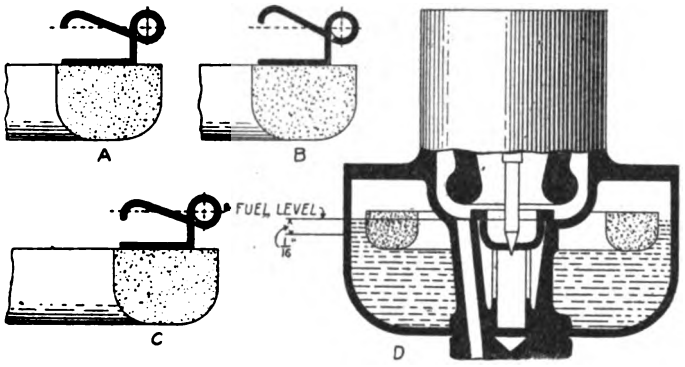
The method of providing two paths for the current is termed paralleling the circuit. The proportion of the resistance in the resistance coil to that in the regulating winding is such that at low dynamo speeds practically all of the current generated passes through the resistance coil, but the current under such conditions is not great enough to cause the resistance coil to become heated. At higher dynamo speeds, the tendency of the dynamo to increase its output is counteracted by the action of the resistance coil. The increased dynamo current flows through the resistance coil, and when this occurs the material in the coil becomes heated, increasing the resistance very rapidly, and allowing a greater portion of the shunted or parallel circuit to flow through the regulating winding.

The principle of operation of the cut-out is shown at B and C, and as may be noted the potential winding always remains electrically connected with the dynamo, and the current passing through this winding flows always in one direction, as indicated by the light arrows. When the contacts are closed, current flows from the dynamo through the cut-out series winding to the battery, as indicated by the heavy arrows at B. When the output of the dynamo is below that necessary to charge the battery, the current, instead of flowing from the dynamo to the battery, flows from the battery to the dynamo, as shown at C.

Under such conditions, the direction of the current through the potential winding remains the same as in the case where the voltage of the dynamo exceeds that of the battery, the change being in the direction of the current through the series winding of the cut-out, as shown by the heavy arrows. This reversal of current through the series winding results in the contact points separating, preventing the battery from discharging through the dynamo.

Bosch Dynamo Circuit.—A, Diagram Showing Current Flow and Principle of Operation; B, C, Principle of Cut-Out; D, Circuit Diagram.

2342 **Another Ring Question.**



From M. Jessup, Michigan.—Would like some information concerning a 1913 Buick model 31 equipped with Schebler carburetor and model RL Remy magneto and LE switch and coil. The two middle cylinders leak oil, the No. 2 quite badly. I only get about 15 miles without cleaning the spark plug. The carburetor and magneto have been to the factory. Have installed Inland piston rings in the top groove of piston and a plain ring in the middle groove. The lower groove has an old ring. The car has been run about 8,500 miles. It has never been hot or dry. There isn't a scratch or a mark on the cylinders and the old rings are perfectly smooth and shiny all around. The carbon has been cleaned out and valves ground. Sometimes the engine has lots of power and other times it is dead. Have run it about 700 miles since rings were installed. The engine will miss for quite a way and all at once will take hold and work fine for a way. What do you think of filing the upper edge of the piston rings and making them round as D. C. Bays did? What are the symptoms of a bad coil?

Reply.—The symptoms are those of mixture conditions upset by the spraying nozzle or needle valve being clogged or the fuel line partially clogged. The height of the fuel in the float chamber has an effect upon the mixture, and when the level is too low the mixture is starved. Too high a level results in too rich a mixture. The better way to alter rings is as suggested in the answer to No. 2289 in the December issue. A defective coil causes erratic operation of the engine.

Digitized by Google

2343 Many Questions.

From John Vossler, Indiana.—1—The strength of the Ford magneto in volts is from 9 to 30. What is it after it passes through coils going to the spark plugs or what is the primary and secondary ratio? 2—If I connect my lamps in parallel instead of in series, what voltage and amperage lamps should I

Showing the Float Assembly of Holley Carburetor and How Level Should Be Set.

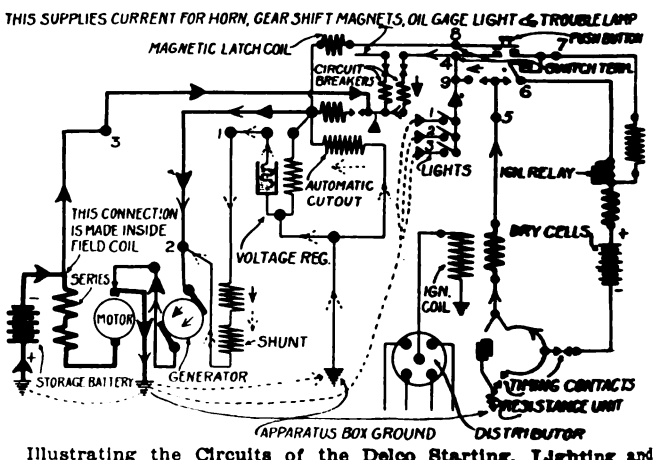
purchase to avoid drawing too much current from the magneto? 3—When connected in parallel does it double the voltage or the amperage? 4—If my car is running 20 miles an hour, what is the piston speed per feet per minute or what is the engine and rear wheel ratio? 5—When the high speed clutch cannot be tightened any more can a new disc be put in or must I put in a new set of discs? 6—I want to put in a new float in a 1914-1915 Holley carburetor. Can you give me the proper float adjustment? 7—What kind of advice is that given by James Hobart on page 47 of the November issue? He says the carburetor adjustment should not be touched. If I didn't open my Holley carburetor a half turn when the engine is cold, I would be all day trying to get started. I know many others who do the same thing. The Ford Company says open the needle valve a half turn when the engine is cold or in cold weather, as it makes starting easier.

Reply.—1—Anywhere between 30,000 and 40,000 volts, it depending upon the number of turns or length of the primary and secondary windings. 2—Twelve to 16 volt, one ampere, 15 candlepower bulbs should be used on old cars and 18 volt with the new type of magneto. 3—Wiring in series increases the pressure or voltage; in parallel or multiple the amperage or capacity is increased. 4—At 1,000 r. p. m. and on high speed the car travels 24.59 miles per hour. 5—An examination of the large and small dics and large or thrust plate would be necessary before answering this question. 6—The float assembly and level is shown in an accompanying drawing. 7—Mr. Hobart evidently intended to convey the impression that much of the trouble experienced with carburetors is due to tampering with the adjustment. You are correct as to the Ford and the same will apply to a number of other makes.

2344 A Motor Sled Problem.

From L. De Laney, Michigan. — Last winter I built an air sled having a single cylinder buckboard engine. The bore is 3¼ and stroke 4½. The propeller is four inches diameter with a three-inch pitch, two blades, true pitch. The blades are of parabolic section and are 2½ inches wide. The engine is geared back ¾ to 1. The outfit weighs 275 pounds. Under ideal conditions I failed to get thrust enough to start the sled. Neither would it keep itself in motion after being started by hand. The propeller does not seem to be much more than half a load for the engine, as the engine fairly runs away with it. Do you think it possible to drive a sled of this kind with a propeller? I intended trying a propeller of heavier pitch and with wider blades, as I do not like to increase the diameter on account of making the rig higher and wider. It seems to me that a four-foot propeller should be able to absorb all the power that an engine of this size can develop. Do you think that using a higher gear ratio with the same propeller would help any?

Ed. Note.—Perhaps some of our readers who have had experience in constructing motor-driven sleds can give Mr. De Laney the information he desires.



2345 Engine Overheated.

From N. S. Wright, New York.—Would appreciate your opinion as to the damage done to my Paige car. On a day when the temperature was at zero I filled the radiator and drove about 20 miles. The engine got so hot that it would not run. The next day we filled the radiator with hot water but the engine would not start. We found the battery quite low. Have put the car up for the winter.

Reply.—It is difficult to state how much or little damage has resulted without examining the engine. The fact that the engine got very hot does not indicate that it is damaged, particularly if there was plenty of oil in the lubricating system. Would suggest a careful examination, testing compression, examining bearings, etc.

2346 Circuit Diagram of Delco System.

From J. Schneider, New York.—Would it be possible for you to publish a wiring diagram of the Cunningham or a Cadillac car with the Delco system of lighting, starting and ignition and show by arrows the path of the current?

Illustrating the Circuits of the Delco Starting, Lighting and Ignition System of a 1914 Cadillac Car. The Arrows Indicate the Path of the Current.

Reply.—The path of the current was explained in detail in the November issue, page 51. The accompanying illustration shows the diagram with arrows indicating the path of the current.

Digitized by Google

2347 Is Storing Car for Winter.

From L. Savard, New York.—My car is a 1916 Reo Six. Have had the carbon removed, etc. Have put car in storage until April on account of the snow. Would you advise me to put kerosene or cylinder oil in the engine to prevent rust or is there something better. There is a knock in my engine which I think is a piston slap and in the No. 4 cylinder. The knock has been there ever since the car was new and I have driven it over 10,000 miles and the knock is no worse. My reason for believing it is a piston slap is as follows: I placed a small quantity of kerosene in the cylinders. In a few hours the No. 4 cylinder was dry. The others held the oil. The service man from the factory said my trouble was a wristpin knock. What is your opinion? Where can I get made those gauze cones referred to in the October number? Which had I better use, the No. 60 or 80, and how many on my engine?

Reply.—Use cylinder oil and with the engine warm pour a small quantity in each cylinder. With plugs removed or petcocks open turn the engine over by hand and several times to work the oil around the rings, etc. An examination will reveal the cause of the knock. It looks as if it might be a piston slap as you state kerosene works past the rings of the cylinder in question. You can make the cones described or have them made at any tinsmith. Use a cone for each branch of the intake manifold as described and illustrated in the article. Try the No. 60 gauze.

2348 Charging With House Current.

From John Kelby, New Jersey.—I want to charge my storage battery with the house current. It is a Willard 6-80. The charging rate is—starting 12 and finishing four amperes. How many 25-watt lamps should I use and how many 40-watt? Could I charge it with 40-watt lamps as I only use battery on Saturdays and Sundays? If I want to charge a separate cell would it be necessary to disconnect the terminals? On page 38 of the September issue there was an article on spark gaps by Morris R. Machol. Could you tell me where I could obtain the gaps he mentions? I had glass enclosed devices, but they ran down a new set of dry cells in 50 miles and short-circuited the device. I have the Atwater-Kent system. Would they work all right with a magneto?

Reply.—Complete instructions were given in the answer to No. 2220 published on page 50 of the October issue. The spark gaps mentioned are not manufactured or marketed insofar as we know. The gap is a theoretical one. You will have to disconnect terminals.

2349 Engine Fails on Magneto.

From W. J. Hill, Indiana.—I have a Studebaker 25 equipped with a Splitdorf magneto and a transformer coil. Up to last summer I was able to start on the magneto with a quarter of a turn, but for some cause which I am unable to locate, I am unable to start on the magneto at present. When I start on the batteries and switch over to the magneto the engine runs all right. The wiring, coil and magneto seem all right. Will be pleased to have you tell me why I am unable to start on the magneto.

Reply.—The failure to start on the magneto is doubtless due to the fact that the magnets are not as strong as when the engine started as you describe. The permanent type of magnet will lose its strength if subjected to shock or blows and is affected by extreme heat. You probably could start on the magneto if you could rotate the crankshaft of the engine fast enough and advanced the spark more fully. Try decreasing the gap of the spark plugs; also see that the break of the contact points be not too large.

2350 Oil Works Past Rings.

From Bruce C. Junk, Ohio.—I have had the cylinders of my Ford rebored .031 inch oversize. All of the cylinders have good compression. The two front cylinders foul with oil if I carry oil up to the top of the petcock. I have run the car 2,000 miles since having the cylinders rebored. Have installed Ford special taper rings on all pistons. Am thinking of slanting the lower edge of ring grooves and drilling holes to let the oil drain back into the crankcase. Would like to know what size holes to drill, also how many in each piston. Would you advise drilling all of the pistons or just the front ones?

Reply.—Use a No. 30 drill and drill about six holes equidistant. Would drill those giving trouble. If all four pistons are out of cylinders would suggest all be treated.

2351 Carbon in Crankcase.

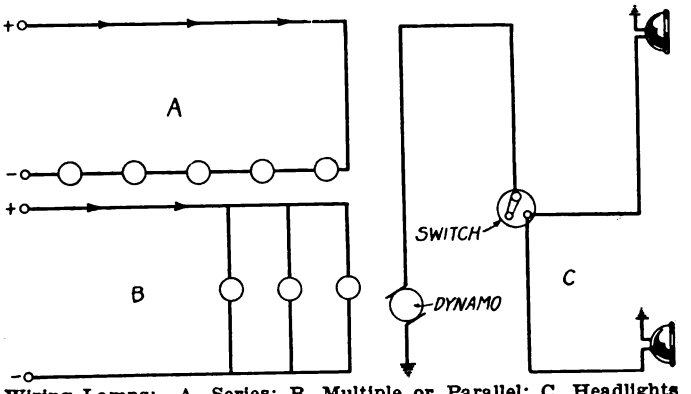
From Joseph Montag, New York.—I would like to know what causes the accumulation of granules of carbon in the crankcase of an engine.

Reply.—Very fine particles of carbon may be present in the lubricating oil, but if large ones be found their presence can only be explained by carelessness when overhauling the power plant.

2352 Variable Vs. Fixed Spark Magneto.

From J. H. Erkmann, Missouri.—I have a NU4 Bosch fixed spark magneto and wish to change it into a variable type. A magneto expert informs me that all that is needed is to cut a slot in the breaker box and attach a lever.

Reply.—The breaker box can be converted from a fixed to a variable or moveable type as suggested but we would not advise so doing as it is essential that the work be carefully performed. In other words, a slight variation in the time of setting would affect the spark obtained. It would be better to purchase a box made for the magneto by the maker, the Bosch Magneto Co. Such a box can be obtained from any of the service stations of the company or direct.



2353 Wiring Lamps in Parallel.

From August Schaack, Jr., Illinois.—Please advise me how I may wire my 1917 Ford to better the lighting conditions. Can the car be wired so that if one light burns out the other will continue to burn? What size globes should I use?

Reply.—We do not believe you will improve the factory wiring of the car; that is, the series wiring. The disadvantage of the series wiring of lamps is that should a lamp burn out the others will be extinguished. This is avoided by wiring in parallel or multiple. Both methods are shown in the accompanying illustration, the drawing at A illustrating

Digitized by Google

series wiring and that at B the parallel. At A the lamps are shown in series with each other; that is, the same current is passing through one lamp after the other. Assuming that two amperes pass through each lamp, and as each has two ohms re-

Wiring Lamps: A, Series; B, Multiple or Parallel; C, Headlights Wired in Multiple.

sistance, the drop between the ends of the lamps would be $2 \times 2 = 4$ volts.

In parallel or multiple circuits the current divides up; each part of the circuit taking current according to its resistance. The drawing at B shows three lamps in a multiple circuit and three amperes are drawn. In the sketch the three amperes are divided up into three separate currents of one ampere each. The current divides as shown because the resistance of each branch will not permit any more to pass through.

The drawing at C shows multiple wiring of the headlights and 18 volt bulbs should be used with engines equipped with the new magneto. A disadvantage of wiring in multiple is that care must be exercised in running the engine to avoid burning out the bulbs.

2354 Gasoline in Crankcase.

From C. A. Van Wert, New York.—Upon draining the crankcase of three of our cars recently, I found from a gallon to five quarts of gasoline in each crankcase. While this is not new to me I cannot understand why it should be present in such large quantities. All of the engines have good compression in each cylinder, but they have been run several thousand miles. I understand that the crankcases of the cars were drained in August, but have been run several thousand miles since. Two of these cars are six-cylinder Premiers and the other is a six-cylinder Lexington. Could this have been caused by running with one or more cylinders missing?

Reply.—Fuel escaping past the rings and into the crankcase would mix with the oil, thinning the latter. Are you sure the fluid is not water?

2355 Grounding the Battery.

From F. Jeffrey, Nebraska.—What is the best practice in packing the cylinder heads of gas engines aside from the regular copper asbestos gasket? Is there anything better than asbestos paper and white lead? Is there any rule for connecting storage batteries as to which pole to ground with single wire systems, also double?

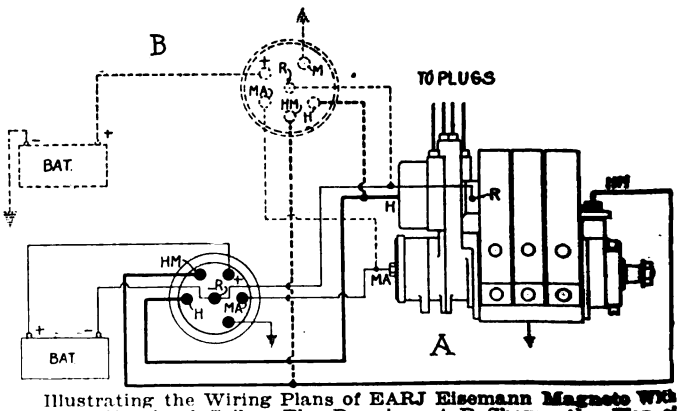
Reply.—There are several good heat and waterproof packings marketed and which can be procured at any automobile supply house. In the single wire or grounded system the positive + is connected to the parts receiving the current. The other side or terminal of each part is connected by wire to the metal frame. The negative — is connected to the frame or ground. In the two-wire system neither wire is grounded. Both are insulated from the frame.

2356 Setting Ford Timer.

From Wm. Ryan, Illinois.—Would like to know how to set the timer or time a model T 1916 Ford.

Reply.—To replace or reset the timer make sure that the exhaust valve of the No. 1 cylinder (that nearest the radiator) is closed. The brush is replaced on the camshaft so that it points upward. This may be ascertained by noting the operation of the No. 1 valve.

2357 Has Trouble With Brush.



From Thomas Seary, Texas.—We have a model E Brush and the gearset or transmission is giving trouble. When we start in the low the wheels seem to lock. When trying to go in high there is a terrible racket and the car will not move. We cannot get the car to reverse. There is no one in this country that knows anything about this car. It is said to have the same gear-set as the Ford except a hand lever is used.

Reply.—The gearset or transmission used on this car is a form of planetary and the lever referred to is used to lock the high or direct drive. Your trouble is evidently due to the gearset being so badly worn that it will not function. Disassemble it and locate the trouble. It will only go together one way and that is the right way. If parts are badly worn you can obtain new ones from the Standard Motor Parts Co., Newcastle, Ind., or the Puritan Machine Co., Detroit.

2358 Wiring EARJ Eisemann Magneto.

From John Smith, Vermont.—Please send me a diagram or wiring plan for the model EARJ Eisemann magneto. It has a coil.

Reply.—The EARJ Eisemann magneto (dual) use both vibrating and non-vibrating coils. The D2U and DCR are non-vibrating and the DT is vibrating.

Illustrating the Wiring Plans of EARJ Eisemann Magneto With Different Types of Coils. The Drawing at B Shows the Plan of the D2U and DRC Coils.

The first named have mechanical vibrators actuated by means of ratchets to facilitate starting on compression. The DT has an electrical vibrator which is set in motion when the switch lever is thrown to the "Battery" position, providing the battery

Digitized by Google

breaker contact points are closed. These types of coils embody the necessary switches for both the magneto and the coil.

The wiring plan of the DT coil is shown at A and with the high-tension wires indicated by heavy lines. The light lines show the primary wires. The sketch at B shows the wiring of the D2U and DCR coils. The DCR connections are exactly the same, but the terminals on the bottom of the coil, according to symbols, occupy different positions on the plate. Wire according to the symbols. The wiring plan at B is shown by dotted lines and as may be noted the connections from the coil terminals to those on the magneto are shown by splices. Both wiring plans are given as the type of coil was not mentioned.

2359 **Kerosene as a Fuel.**

From Lloyd Reeve, New Jersey.—Inasmuch as kerosene as a fuel for motor car engines is becoming, in all probability, a necessity, I should like to have your candid opinion concerning same.

One man, a draftsman who had been connected with the manufacture of gas and gasoline engines for a number of years, says a gasoline engine will not successfully operate on kerosene even after a special carburetor and intake manifold are provided. He says that all the kerosene will not burn, thus leaving a deposit on piston head, cylinder head and walls, etc., that it will have a worse effect on the engine than carbon. He also adds that the kerosene will leak past the piston rings, enter the lubricating system, thin the oil, and so ruin the engine.

My opinion on the matter is this: Gasoline to be had now-a-days is of a very poor grade. As every one knows, carburetion of same is far from perfect. Also, gasoline is of a lesser density than kerosene, so I think that it would more readily pass the piston rings than kerosene. Unless there may be some chemical reaction between kerosene "gas" and the iron of the engine, I can see no reason why it should not be used.

Now I have one more question to ask. Assuming that kerosene is a satisfactory fuel, what is the approximate mileage that can be secured from same with good carburetion?

The above is more of a manuscript than a question or so, but I hope you will print enough of same to make the idea clear. Believe me, your opinion on the matter will be very much appreciated.

Reply.—The successful use of kerosene as a fuel in the internal combustion engine depends upon a number of factors, the discussion of which would require considerable space. If the carburetor, vaporizer or other device will break up and convert the fuel in question into the right kind of a vapor, and if this vapor is properly mixed with air, and there is no tendency for it to revert back into a liquid, etc., kerosene can be used. As you say, the time is coming when kerosene or a fuel similar to it will be used in the variable load, variable speed engine, the automobile engine. As to the mileage, it is claimed that more heat units are obtained with kerosene than with gasoline, and the automobile engine is a heat engine.

2360 **Gear Ratios, Speed, Etc.**

From George R. Blain, Illinois.—What is the bore and stroke of the little Buick 4, the Dodge and the Ford, all 1918 make? What is the gear ratio of each; that is, the gear ratio at their different gearset speeds? What horsepower will they develop at a car speed of about 20 miles an hour? Explain and give an example of how the horsepower is figured using the Dodge engine, for example. Also explain how the length of the stroke affects the power. Does the position of the valves in the Buick give the engine more power than if they were placed as in the Dodge?

Reply.—The bore and stroke of the Buick is $3\frac{7}{8}$x$4\frac{3}{4}$. That of the Dodge is $3\frac{7}{8}$x$4\frac{1}{2}$. The Ford is $3\frac{3}{4}$x4. The gear ratio of the Dodge on the low and reverse gears is 19.434 to 1; intermediate or second, 7.978 to 1; direct drive or high, 4.166 to 1. The horsepower developed at 20 miles an hour car speed is $10\frac{1}{2}$ on the direct drive or high.

The gear ratio of the Ford on the low speed is 10 to 1. On the high or direct it is 3 7/11 to 1. The reverse is 14.5 to 1. At 1,000 r. p. m. the car speed is 24.59 miles per hour on the direct drive, 11.178 on the low and 7.794 on the reverse. The horsepower developed at 20 miles per hour is not given. We have no data on the Buick engine.

To figure the horsepower of an engine and according to the S. A. E. formula which takes into consideration the bore only, square the bore, multiply by the number of cylinders and divide by 2.5. For example, the bore and stroke of the Dodge car is $3\frac{7}{8}$x$4\frac{1}{2}$. Using the decimal equivalent for $\frac{7}{8}$, we have .875. Multiplying 3.875x3.875 (squaring the bore) obtains 15.015625. This multiplied by the number of cylinders 4 obtains 60.0625. Dividing the result by 2.5 gives 24.22 the horsepower.

The advocates of the valve in the head type of engine claim greater power than the conventional design. If you mean difference between the long and short stroke motor, would explain that the short stroke engine is a high speed design while the long stroke is generally confined to slow speed engines. Short stroke engines also have a longer period of valve opening.

2361 **Kerosene Anti-Freeze Solution.**

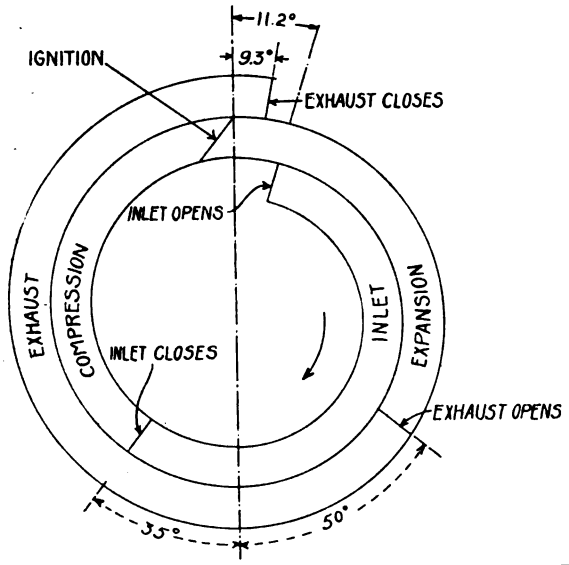
From P. H. Harner, Virginia.—I noted in a past issue where some one was using kerosene in the radiator instead of water to prevent freezing. I want your opinion as to my plan of taking several gallons of cheap machine oil and thinning it with kerosene. I have never tried this. What do you think of it? Seems to me I have read where some one used just the machine oil.

Reply.—We do not approve of the use of oil or even a mixture of oil and kerosene in the cooling system of a car. The reasons have been given in practically every issue for the past three months.

2362 **Engine Starts Hard.**

From E. Coplin, Ohio.—I have trouble in starting my 1916 Saxon Six in cold weather. It is almost impossible to start without filling the radiator with hot water. The engine has priming cups, but after priming it will run a few seconds then stop. When engine is warm it runs fine and pulls well. The carburetor is a Rayfield.

Reply.—Either the mixture is too thin, too little fuel in proportion to the air, or the fuel does not flow freely through the jet. Try choking the air



Digitized by Google

supply and slightly flood the carburetor until the engine warms up. Your trouble is not an uncommon one in cold weather.

2363 Average Valve Timing.

From F. D. Hume, Massachusetts.—Will you tell me how to time a four-cylinder engine? This engine has no markings and the camshaft gear is smashed. It is an orphan and we have tried in vain to get the timing plan. What is the average timing?

Reply.—The accompanying diagram gives the average valve timing of four-cylinder engines. It is the average of American-made engines. Your best plan would be to try a setting and note how the engine runs. If the engine be small and run at high speed try having the inlet open from 12 to 15 degrees after top dead center and close 25 to 30 after lower dead center. Have the exhaust close from 10 to 12 degrees after top dead center. If a large engine and runs slow, try an inlet opening of 5 to

Illustrating the Valve Timing of the Average American Four-Cylinder Engine.

10 degrees after top dead center and a closing of 15 to 20 degrees after lower dead center. Have exhaust open 30 to 40 degrees before lower dead center and close 0 to 5 degrees after top dead center. For medium speed engines use timing between the two.

2364 A Number of Questions.

From L. J. Macdonald, Connecticut.—I have been reading your magazine for the past year and have secured a great deal of useful information from it, and although I subscribe to similar magazines, there are none that I like as well as yours. I would like to ask you a few questions. 1—What kind of piston rings do you advise for use in a Ford car? Is there any choice between the McQuay Norris, Inland, No-Leak-O or Munger or High-Comp? 2—Can you give me a diagram showing how to build or make some kind of an attachment to inject warm air into the manifold on a Ford car in place of the cold air opening that I am now using; that is, pet cock with a 1/8-inch opening? 3—How can I test the coils in order that they will all work alike and in buying new points what kind do you advise? 4—In a recent issue you gave instructions for making a wire cone for a Ford manifold. I cannot locate the issue. 5—Is there any way that I can test the compression of a Ford engine except by cranking? If there is an instrument on the market, please tell me where it is made and by whom. 6—What do you consider the most satisfactory lens for a Ford machine? 7—Do you know of any spark plug that will give better results on a Ford than a Champion X and what is your opinion of the new AC? 8—What is the difference, if any, between a ball and a brush timer, and has one any preference, if so, which? Also what make do you advise? 9—Do you advise changing the gear ratio on a touring type of Ford and what benefit would I derive by so doing?

Reply.—1—We never recommend any make of a ring in preference to another. 2—Use a stove over the exhaust or place the opening of the air device in close proximity to the exhaust. This will permit of the use of heated air instead of cold. 3—The proper method of testing coils to see if they draw a similar amount of current is to insert a low reading ammeter in the primary coil circuit. One terminal of the ammeter is connected directly to the coil terminal and the other ammeter terminal is connected to the battery, the usual connection being removed for the time being. Another method is adjusting by ear, noting the sound of the cylinder in question as well as the action of the vibrator. Buy the same points or same make as used in the coil. 4—The instructions were published on page 59 of the October issue. 5—Compression is tested by inserting or threading a gauge in the spark plug opening in the cylinder. These gauges can be secured at any supply house. 6, 7—We cannot answer these questions for the reason given in the reply to the first question. 8—With the ball time of timer the contacting member strikes or contacts with a steel ball and the impact is broken or cushioned by a spring in back of the ball. The brush operates on the principle of a brush wiping or touching a part to complete the circuit. 9—Changing the gear ratio is not advisable unless one desires to indulge in racing.

2365 Silent Chain Is Noisy.

From Arthur Pugh, Canada.—I have an English Knight engine. The sleeves are operated by chain and the chain has stretched and is noisy. Owing to war conditions it would be difficult to procure another chain. Is there any way of silencing the chain? It is not slack enough to permit of removing a link. I thought of taking the front cover off the engine, drilling and tapping the case to take a 1/2-inch bolt or one as big as practical, caseharden it and mount on it and rotate a phosphor bronze bushing with an interlining of fibre. I propose to place it between the large and small sprocket and against the chain to act as an idler. I believe it would eliminate the noise. What is your opinion? Am fitting new rings. The bore is 4 7/8 inches. How many thousandths should I leave between the ends of the rings?

Reply.—The installation of an idler would tend to control the slack but will not cure the noise. The better way would be to buy an American-made type of silent chain, also sprockets for same. Any manufacturer of the silent type of chain will supply you

Digitized by Google

with data sheets upon application. Allow between .008 and .015-inch between ends of rings for expansion caused by heat.

2366 **Wants Horsepower Rating.**

From J. Harry Kelly, South Dakota.—1—What is the horsepower of a four-cylinder engine having a bore of 3¼ inches and a stroke of 5 inches, and how is it figured? 2—What is meant by the term two-cycle and how do you determine the number of cycles of an engine? 3—What is the number of cycles used in the Delco farm lighting equipment?

Reply.—The horsepower, S. A. E. rating, is 16.92. It takes into consideration the bore only. The formula and an example are given in the answer to George R. Blain. The two-cycle engine derives its name from the fact that the mixture enters the cylinder and the burned gases pass out through openings or port holes in the cylinder walls as the holes are uncovered by the piston. During two movements or strokes of the piston the four operations of intake, compression, firing and exhaust occur. The original term of the engine described was two-stroke, which is more nearly correct than two-cycle. The cycle, as referred to, is determined by the number of strokes and occurring during a revolution of the crankshaft. With the four-cycle engine the crankshaft makes two complete revolutions during the four strokes. We have no data on the farm engine mentioned.

2367 **Fitting Aluminum Pistons.**

From Fletcher & Metterl, Ohio.—How close should aluminum pistons be fitted in a Ford?

Reply.—This question has been answered several times of late in this department. The clearance varies according to the design and type of piston and engine speed. For average speeds .007 to .008-inch at skirt, and .014 to .016-inch at top. For racing, .014 to .015-inch at skirt and .024 to .027 at top.

2368 **as Short in Secondary Circuit.**

From M. O. Nelson, South Dakota.—I am having trouble with my Ford. The ignition is at fault. There appears to be a short circuit which will at times stop the engine. After cranking a while the engine will restart. The points of the coils seem to spark and more than one at the same time. I have tested out the primary wires from timer to the coils, also looked the timer over, but cannot locate the fault.

Reply.—The intermittent missing or short circuiting is doubtless caused by a short or ground in the secondary circuit. If the trouble occurs when driving over rough roads look for movement of the coil units in the coil box as the units may come in contact with the metal of the cover. Dampness in the box will cause misfiring. Go over all secondary wires for possible grounds and examine insulation carefully. Clean and true contact points of vibrators.

2369 **Wants Electric Lighting.**

From V. D. Barbot, Georgia.—I desire to equip my 1911 Hudson with electric lights, although the car is seven years old, it is in good shape and affords splendid service. I have to use a Prest-O-Lite tank, but do not like it. While I know it is not your policy to recommend one product over another, and I am not asking you to break your rule, is there a practical generator that can be used on old cars or is there a concern rebuilding and selling second hand generators?

Reply.—There are several concerns, manufacturers, who supply lighting and starting equipment for used cars, particularly lighting dynamos. Some of these concerns have in stock the brackets required for mounting the dynamo, as its practical use involves only a proper drive and mounting. Would suggest that you purchase new equipment, also make inquiry at the service station of the manufacturer whose equipment you may be interested in.

2370 **Battery Is at Fault.**

From S. Nelson, Montana.—The starter connection of the battery is loose; that is, the post itself. When I attempt to start the engine with the starter the post or terminal will smoke and the engine will not start. I find nothing wrong or missing. There is a leak at the connection and the acid has destroyed a corner of the battery where the wires rest, and the covering of the wire is eaten off, but the inside is all right. Is the trouble in the battery or the starter?

Reply.—The battery is at fault. The smoking or burning action is due to a resistance in the circuit and the trouble as well as the leak should be remedied. Send the battery to the nearest service station or to some expert for repairs.

2371 **A Question of Condition.**

From Daisy, Washington.—I have the parts of a 1917 Dodge car which was in a fire. I have taken it all apart and the engine seems good as new. I have put in new bearings as the old ones had started to melt, also installed new valve springs. The aluminum transmission case is partly melted. The axles, differential and gears look good and sound like bells. There was about three pints of oil in the crankcase after the engine cooled. Of course all of the electrical parts were ruined. The carburetor and Timken bearings seem to be good. Is it advisable to use these parts, especially the engine?

Reply.—This is a difficult question to answer without an opportunity of inspecting the parts. If the bearings in the engine melted as did the gearset housing, it is evident that the parts were subjected to considerable heat.

2372 **Another Horsepower Question.**

From J. R. Benson, Illinois.—I would like to know the horsepower of a four-cylinder, four-cycle engine having a bore and stroke of four inches.

Reply.—The horsepower, S. A. E. rating, is 25.60. The formula for ascertaining the horsepower of engines is given in the answer to George R. Blain.

2373 **A Vulcanizing Question.**

From J. L. Vaughan, New York.—I have a vulcanizer that works by a steam pressure and a clock just like a steam boiler. I get repair gums with instructions to vulcanize at so many degrees of heat, Fahrenheit, and I am at loss to know just how many pounds of steam I should carry. If you could give me a table it would be a great help, as I am par-

Digitized by Google

ticular and like to cure just right, according to the instructions of the gum makers.

Reply.—The following table gives the degrees in temperature and pressure of steam, pounds:

Temperature	Pressure	Temperature	Pressure
227.2	5	280.6	35
239.4	10	286.7	40
249.8	15	292.4	45
258.8	20	297.7	50
266.8	25	302.6	55
274.0	30	307.2	60

2374 **Carburetor Information.**

From George Geiken, Nebraska.—Please insert a drawing of new Stromberg carburetor for the Ford car and show the different parts. Also explain how it operates, how it makes the mixture and fully explain the different adjustments.

Reply.—To give the information you desire would require at least two pages, and as the space is limited, we would suggest that you write the makers of the carburetor. They will supply you with a booklet giving the information desired.

2375 **Fuses Burn Out.**

From Frank Hageman, Washington.—What is the matter with the lighting system of my 1914 Detroiter? It is equipped with a Remy system. When I pull the button to light the headlights the fuse burns out every time, especially when the engine is running. The bulb has burnt out when the engine was idle. I have hunted the wiring over for a short circuit, but cannot find any. The tailight fuse does not burn out. The current passing through the fuse is very strong, as I have watched the flash in the glass when I pull out the button.

Reply.—You have a short circuit or are using the wrong type of bulb in the lamps. Are you sure that you have replaced the original fuse with one of similar capacity? See that fuse is of the proper amperage and is that supplied by Remy Company. They are special fuses. If you cannot locate short, take matter up with service station expert. The Remy Electric Co. have a service station at 606 East Pike Street, Seattle, Wash.

Ether for Priming.

From George C. Murphy, Maryland.—Noting that Roy Kenney, of Kentucky, asks about the use of ether for starting, will give my experience. I had to remain out all day and night with a White truck in a snow storm. The next day the engine was so stiff that I could not spin it with the compression released. I got some ether and used it in the raw state. Every time I budged the crank the engine would knock and start for a second. After a while I got the engine running and warmed up.

I noticed a miss and found the trouble to be a bursted spark plug. I fixed that and used the truck during the balance of the day, but noticed on a hard pull the engine would miss a little. In looking for the trouble that night I found an exhaust valve warped. I faced the valve off, reground it and had no more trouble for a few days. The next time the car was out in the cold I used a teaspoonful of ether to a half pint of gasoline.

After warming up the engine, I noticed a general missing and found that all of the nuts holding the porcelain in the plugs were loose. Took out the porcelains, but they were not cracked, so put them back and the engine ran fine.

Now I have had one and year-half years' experience as a repairman and with a fleet of trucks and never before have I noticed that ether had any bad effect on engines, so I went to work trying to get some way to make starting easy. I took the manifold, which is very thin and made of bronze, and bored a hole at the curved section where it goes to the cylinders. I soldered a priming cock in the opening. The next time the engine was cold and stiff I got a fellow to crank with the compression released while I let ether mixed with gasoline drip in through the petcock opening.

The engine started at once. Of course, you must give the engine compression again or she will stop. By this method all of the ether is ignited before it causes any damage and passes out in the exhaust. Of course, you must be careful not to get a back kick. I have taken the engine down and find no bad effects. I believe this is the only way to use ether.

Cure for Noisy Tappets.

From Harold Cleveland, Kansas.—I have been a reader of your journal for about a year, and having profited by many articles, would like to say, for the benefit of No. 2298, experiencing noisy tappets, that if he will take his pushrods and have them rounded off by a competent blacksmith on a slow emery wheel, it will cure the trouble. I had the same trouble for about a year and overcame it by this method.

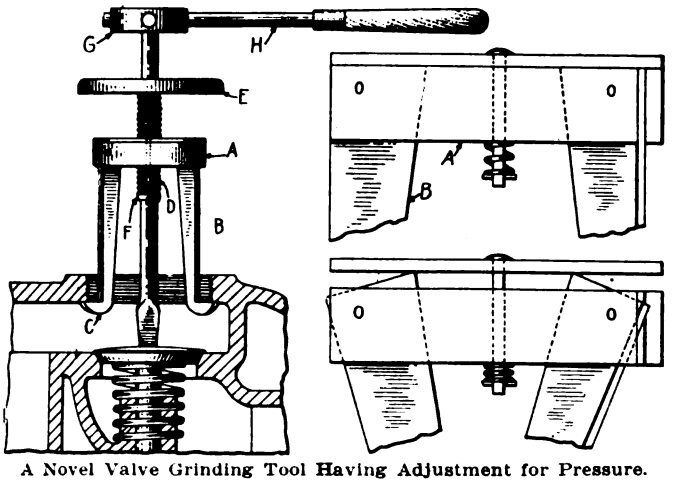
A Pointer for Mr. Snedaker.

From L. P. Conklin, New Jersey.—Perhaps I can help Mr. Snedaker, No. 2307. I have owned a car, or cars, the last 14 years. Have done all my own repairing and have never yet had to get anyone to assist me, when in trouble, outside of the trouble department in The Automobile and Repairer. A few weeks ago I thought I was surely stuck. I had a new Ford with one of the smoothest running motors I ever rode behind. After about 1,000 miles it began to act just like Mr. Snedaker's Maxwell. I took out all the spark plugs and found them clean and points all right. Then I went over the wires, coil, magneto terminal, etc., found everything apparently all right, then sat down and said to myself, "you are stuck, for the first time in your life." The next day I started in again and while monkeying with the spark plugs I discovered that the porcelain was a little loose in the shell of one of them and leaked air. I put a new plug in its place. That settled my trouble. Look for a leaky spark plug. Have taken The Automobile Dealer and Repairer since its first issue, that is why I have been able to do all my own automobile repairing without calling in a garage man to help me.

A New Excuse.

Here's a brand a new excuse for being intoxicated. one of the many which just now is interesting "dry" Washington:

Thomas Brooks, a chauffeur, arrested on a charge of driving an automobile while under the influence of liquor, told the Court that he had become intoxicated from the fumes of alcohol placed in the radiator to keep the water from freezing.



"I thought I'd heard all the excuses," said the Judge, "but this one will cost you $25."

NEW VALVE GRINDING TOOL.

Has Adjustment Whereby Pressure on the Valve May Be Varied.

A novel and interesting type of valve grinding tool has been invented by an English motorist and is described in the Autocar, an English motoring print.

A Novel Valve Grinding Tool Having Adjustment for Pressure.

The accompanying sketch is almost self-explanatory insofar as the operation of the tool is concerned.

The invention consists of a metal disc A, around the circumference of which are pivoted three legs B, with the toes C turned outwards at right angles. Through the center of the disc passes a threaded sleeve or bolt D, carrying at its upper extremity a turn-button or wheel E, by means of which the bolt can be screwed either upward or downward through the disc carrying the three legs.

Passing upward through the center of the threaded sleeve is the shaft of a screwdriver, which carries on it, about halfway down, a shoulder F against which the lower end of the threaded sleeve bears. The upper extremity of the screwdriver shaft is provided with a solid metal cap G, through which are drilled at right angles to one another two holes to take a tommy-bar H.

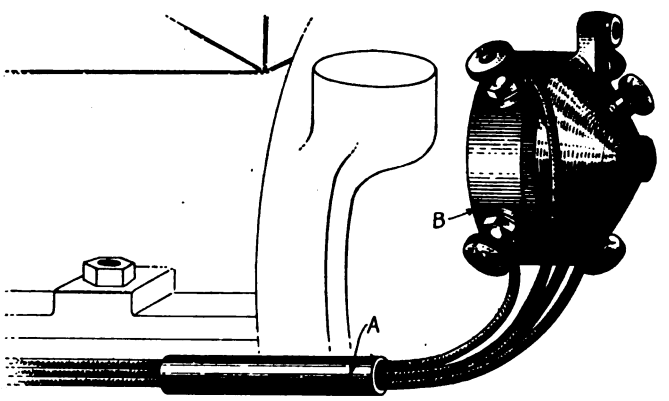
Raises Valve From Seat.

When valve grinding has to be undertaken, the valve spring with its cotter and retaining washer are removed, the valve itself is withdrawn, and then replaced with a light helical spring interposed between the underside of the valve head and the cylinder casting close to the top of the valve stem guide. This helical spring is shown in place in the sketch, and its object is, when the downward pressure on the screwdriver is released, slightly to raise the valve from the seating, so as to give a better chance to the grinding compound to remain upon or return to the faces to be treated.

Regulates Pressure.

After the threaded sleeve carrying the grinding screwdriver has been adjusted to approximately the desired position, the operator grasps the three legs of the tool, and compreses them inward, so that the toes can be pushed down through the valve cap orifice. When the inward pressure on the legs is released, the legs themselves tend to spread again, so that they come into contact with the walls of the orifice, the toes catching on the level surface of the underside of the casting, as shown in the main sketch. The threaded sleeve is then screwed down until the end of the screwdriver blade is pressed firmly into the slot in the valve head and the latter is in grinding contact with the valve seating; finally, the tommy handle is inserted, so that the necessary reciprocating grinding action can easily be produced. The desired pressure and the occasional release are obtained by operating the threaded sleeve.

How Expansion Is Obtained.



The smaller sketches to the right of the main illustration show the simple method whereby the pivoted legs carried by the central disc are kept normally expanded. As will be seen, there are, equally spaced round the disc near its outer circumference, three small vertical pins, terminating at their lower ends in spring washers and cotters. These pins pass not only through the disc, but through a thin circular cover plate, of which the lower surface is in contact with the inner point of the top of each pivoted leg. Inward compression of the legs results in their inner toe points pushing up against the underside of the cover plate, the last-named being raised within the limits permitted by the spring washers at the bottom of the pins.

When the inward pressure on the legs is removed, the spring washers expand again, pulling down the cover plate of the disc, and so forcing outward the lower extremities of the pivoted legs. The sole object of the spring top of the disc carrying the legs is to ensure the toes catching firmly beneath the casting into which the valve cap screws.

Protecting Primary Wires.

Although the primary wires, those leading from the commutator or timer on the Ford car are colored to facilitate replacing correctly, they quickly become soiled. Under these conditions the colors cannot be used as a guide when replacing a wire unless the wire is traced from the coil or a section not discolored.

An exchange suggests a method the principle of which is enclosing the wires in a fibre tube to avoid the possibility of oil and dirt discoloring the insulation.: The scheme consists of using a tube about 3 inches long and ⅜-inch diameter inside. The leads are run through the tube, as shown in the accompanying sketch at A. Whenever one desires to replace a wire removed from the timer terminal the tube is slipped back or forward disclosing a clean section of the wire and its color. The tube should be a snug fit else it will slide.

Illustrating Use of Fibre Tube to Keep Primary Wires Clean and Making Easy Identification of Colors.

THE IMPORTANCE OF CAR INSURANCE.

There are not many car owners, probably, who have ever appreciated fully the necessity of covering the many risks in connection with a motor car with proper insurance. Not many, perhaps, know how many kinds of insurance there are.

First, there is the liability insurance, which covers all cases of individual injury. Then come collision insurance, which covers any damage which may result to the car from collisions. Third, there is property damage insurance, which means any damage which your car may cause to the property of others. Fourth and last, there is fire and theft insurance.

The two most important policies to take out are the liability and fire and theft. But if the car owner wishes to be fully protected, all four classes of insurance should be taken.

We advise our readers who are not insured in any one of the classes mentioned to consult a competent insurance broker and arrange for such insurance as they may feel disposed to contract for. And before accepting any policy read every clause in it. Ascertain what it promises and what you promise before you accept it. As you have to pay a high rate, it is important to see that it actually insures you and your car.

A PERMANENT FUEL ADMINISTRATOR.

The frightful condition the entire country, almost, is in today, owing to a lack of coal, suggests the importance of a law providing for a permanent Fuel Administrator. The distribution of coal in the past has been made in what might be called an accidental way. Sections which clamored the loudest got the most coal.

Heretofore, this haphazard method of distributing coal has not resulted in anything serious; but this year, owing to the congestion on the railroads, in consequence of war conditions, intense cold, etc., there is a shortage of coal everywhere, and great suffering as a result, especially in the cities. In country places, wood is generally available when the coal runs out; but in cities it is different. In New York and vicinity wood suitable for burning either in stoves or in fireplaces costs $22.50 a cord or more and is, of course, beyond the means of the ordinary family.

It would be the duty of a Fuel Administrator to plot the whole country, so to speak, ascertaining the wants of each locality, and seeing to it that these wants were provided for. He should get reports, of course, from the railways, as to the shipment of coal every week or every month, and it could be very easily determined where there is a short supply, and where less coal is needed.

Early in the fall it should be the business of the Fuel Administrator to find out which localities, if any, were short of coal, and to see that they got it. If for any reason a short supply of coal was being mined, it would be the duty of the Fuel Administrator to take measures for speeding up the output. Such an office as this, if conducted efficiently, would be worth much more than its cost to the entire country.

SAVINGS BANK DEPOSITS.

Why is it that the people of Massachusetts make use of savings banks to a greater extent than the people of any other State in the Union?

The savings bank depositors in Massachusetts number one-sixth of the entire savings bank depositors of the whole country.

In point of money these depositors total one-fifth of the entire savings bank deposits of the country.

This is almost a marvelous exhibit of thrift. Just why the working people of Massachusetts save their money and put it in savings banks in a larger proportion than the workingmen of any other portion of the country is one of the mysteries that have never been explained.

It would seem as though an advertising campaign on the part of savings banks in various parts of the country, pointing out the advantages of depositing regularly even a small amount per week or month, would result in increasing savings bank deposits very materially.

AN URGENT REMINDER.

Our learned legislators in Washington (some of them) insist that advertising in periodicals has no educational value and should be taxed out of existence.

All advertisements contain business information of more or less value from an educational point of view and are of far greater importance in promoting the trade of the country than the reading matter of the various publications.

We must once more remind our readers of the importance of writing immediately to their Representatives in Congress and to the two Senators of their States protesting against the unfair and ob-

Digitized by Google

noxious second-class postage law which passed the last session of Congress and will go into effect, if not repealed, the first of July. This will increase postage from 300 to 800 per cent.

It is in every sense a tax on intelligence. It practically imposes a penalty upon every man or woman who subscribes for a periodical of any kind, whether weekly or monthly. It should be resisted not only by subscribers to every kind of a journal, but also by all publishers. It is one of the most outrageous measures ever placed upon the statute books.

If you haven't already done so, please write to your Representative at once as suggested. If you don't know his name you can no doubt get it from your Postmaster. Then write to him at the House of Representatives, Washington, D. C., and ask him to use his influence to have the bill repealed. Also write to the two Senators from your State, addressing them Senate Chamber, Washington, D. C., in the same manner.

FAMILIARITY BREEDS CONTEMPT.

Familiarity with motor vehicles has made people more or less careless. They take chances in crossing streets. They let their wits go wool-gathering when they should be thinking of their safety. To navigate successfully the streets of New York, or any other big city, requires alertness. One must have his eyes and ears open all the time—especially his eyes. Some motor car drivers are careless and reckless. They often assume, when they see somebody in their path ahead, that that person is going to get out of the way as soon as he hears the signal sounded. And on this assumption they rush their cars right along without reducing speed, and are frequently successful in avoiding any trouble.

It is up to the car driver as well as the pedestrian to be careful. People have a right to cross the streets. When a driver sees a pedestrian ahead of him crossing the street he should slow down, if necessary, to allow the person to cross in safety.

WASTED WATER POWER.

For several years a few fanatics have been agitating, in the public press, and before Congress, the question of "conserving," as they call it, the water power of the nation. Their form of conservation, however, is to let the water run to waste, for fear that somebody might profit by building dams and erecting factories for the manufacture of goods, or supplying electricity for manufacturing purposes.

These water cranks have insisted upon such restrictions on the part of the Government as no capitalist would be willing to submit to. Meantime, the country is burning up coal, millions of tons of which could be saved if Congress would permit the utilization of various water powers under its control.

No man or corporation can build a dam and utilize the water power without conferring a great benefit on the surrounding country, at the same time that he or the corporation may be realizing a profit. Permit capital to use the water power on reasonable terms, and the country at large will be greatly benefited.

THE TRUTH IN ADVERTISING.

On another page we print an important legal opinion with respect to advertisements calculated to mislead the public by reason of statements which the goods do not bear out. A positive statement with respect to goods of any kind is held to be in the nature of a guarantee as to the quality of these goods. But read the article.

Advocate Building Good Roads.

At a recent meeting of the American Association of State Highway Officials at Richmond, Va., resolutions were adopted advocating the proper construction and maintenance of the highways of the country. The resolutions, which were presented to the Government through the director general of railroads, are as follows:

WHEREAS, the proper construction and maintenance of the highways of the country is necessary to the successful conduct of the war; and,

WHEREAS, the plans of all highway authorities in the country, all users of highways, and all citizens interested in any way in highway construction and maintenance, are at the present time upset and tied up; and,

WHEREAS, there is need for a definite policy so that plans can be formulated for the coming year; and,

WHEREAS, a properly outlined policy directing the construction and maintenance of such roads and streets as are of general economic and military value will conserve the resources of the country and will greatly facilitate the transportation of freight over highways and streets,

THEREFORE BE IT RESOLVED that the American Association of State Highway Officials request the United States Government to formulate and promulgate, as soon as possible, a definite policy for road and street construction and maintenance, and

That it is requested that said policy contain a statement that freight cars shall be furnished next spring for the transportation of the necessary materials for the construction and maintenance of streets and roads of economic or military value.

Trucks Co-operate With Roads.

A demonstration of the possibility of co-operation between motor trucks and boat lines for the improvement of transportation facilities has been given in the territory adjacent to Long Island Sound, according to reports that have been received by the Office of the Chief of Engineers of the War Department, and communicated to the Department of Commerce.

At New Haven, Conn., products are being received from interior points in that state by auto trucks which deliver goods at the dock of the Starin New Haven Line. Transportation is by water from that city to New York, and the following day the goods are loaded on a through car for their destination on the Lackawanna Fast Freight Lines.

This new war-dispatch route eliminates the transfer car, and the use of car, engine, and floor space in freight house, and tends to consolidation and increased tonnage on the through car from New York to the destination. Among the places in Connecticut that are being put into direct communication with the sound transportation facilities are Derby, Shelton, Ansonia, Seymour, Waterbury, New Britain, Meriden, Hartford, Middletown and Wallingford.

Restrict Use of Fuel.

A series of restrictions concerning the use of gasoline, particularly for private automobiles, are in force in France. The decree provides that after January 1, 1918, no card entitling the holder to purchase and consume gasoline shall be delivered except under certain prescribed conditions, the object of which is to confine the consumption of gasoline to domestic consumption, to vehicles used for transportation by common carriers, to vehicles used for the public service, and to such uses as grow out of the necessities of commercial, industrial, farming and transportation enterprises.

S. F. Beach, Chicago, New Head of N. A. A. A. J.

The new president of the National Association of Automobile Accessory Jobbers is S. F. Beach, of the Motor Car Supply Co., Chicago, Ill. He succeeded Charles E. Faeth, of Kansas City, at a recent meeting of the N. A. A. A. J. held in New York City. Mr. Beach is one of the founders of the organization and has been prominent in its activities since it began. P. H. Lyon, of Chanselor & Lyon Co., San Francisco, Cal., was elected vice president; R. R. Englehart, of the Siego Co., Davenport, Ia., was chosen chairman of the board of directors; William Sparks of the Sparks-Withington Co., Jackson, Mich., is vice-chairman.

S. F. Beach, Charles E. Faeth and William Sparks were appointed a committee on Federal Relations. Practically all of the other general committees remain as before. The directors for one year were chosen as follows:

W. W. Low, Electric Appliance Co., Chicago; G. N. Schafer, Pruden Hardware Co., New York; F. B. Caswell, Champion Spark Plug Co., Toledo; C. E. Jackson, Jackson Motor Supply Co., Pittsburgh; G. M. McWilliams, Hyslop Bros., Toronto; E. C. Graham, National Electric Supply Co., Washington.

Directors for two years: W. D. Alexander, Alexander-Feewaldo Co., Atlanta, Ga.; C. F. Wright, Ballou & Wright, Portland, Ore.; P. H. Lyon, Chanselor & Lyon Co., San Francisco; Wm. K. Norris, McQuay-Norris Mfg. Co., St. Louis; S. F. Beach, R. R. Englehart.

New directors: S. F. Proctor, Minneapolis Iron Store Co., Minneapolis; S. T. McCullom, Auto Equipment Co., Denver; Frank T. Chase, Frank Mossberg Co., Attleboro, Mass.; W. T. Walker, Walker Mfg. Co., Racine, Wis.; L. P. Halladay, L. P. Halladay Co, Streator, Ill.; F. A. Ferris, Ferris-Dunlap Auto Supply Co., Dallas.

Reports of various members representing different sections showed progress during the past year. In reporting for California, Robert Weinstock said that the California Automobile Trade Association had 2,300 members comprising 30 local associations. Each of these is divided into what is termed crafts, which include dealers, garagemen, painters, repairmen, etc. Price cutting had been largely eliminated through educational methods. Shop practices have been standardized, modern accounting methods introduced, etc., with the result that business was not only increased, but made more profitable. Various other states were reported on and along the same lines.

The association has decided not to continue the distribution of its jobbers' list. George H. Fritz, field secretary of the association, spoke on the subject of dealer betterments, which was a vital topic at the meeting. He said in part:

"When you all go back home do not permit your good intentions to be moss-ridden but strain all efforts to put into effect State dealers' associations and immediately start a personal campaign to educate and keep in line the dealers so that they may be able to do a profitable accessory business.

"For this purpose I would suggest the employment of a practical man who will call upon the dealer periodically and who will demonstrate to the dealers the best way to do efficient work. Being that this man represents the dealers' association, he is neutral and, therefore, the element of selfish motive is eliminated. In that way you will instill into the dealer the initiative, which is sorely lacking with many of them, and you will be able to keep the accessory business where it rightfully belongs.

"Sending of literature and bulletins is mighty helpful but I have my doubts that it would have the effect so necessary. Gentlemen, this is a serious problem; indeed, too serious to be overlooked for a moment. I know, because I have made a close study of this question during the past year in my travels and the time for action is now."

The next meeting of the organization wil be held at Hot Springs, Va., June 5-12.

Motor Cars Replace Engines.

To enable division superintendents to get about easily without the use of locomotives needed in regular service, the Chicago, Burlington & Quincy Railroad has converted a number of automobiles of a moderate price make into vehicles capable of traveling on the rails, says the Railway Age Gazette. These automobiles were adapted by replacing the rubber tired wheels with pressed steel flanged wheels, attached to a rigid axle, adjusted to standard gauge. The steering wheel is made inoperative, the steering posts serving to support the throttle and spark levers. Since the steel wheels are somewhat smaller than those with which the car is regularly equipped, it was necessary to apply racing gears instead of the standard gears furnished with the car. This makes possible a speed of 40 miles an hour. A frame is placed under the center of the car, on which it is raised when it is necessary to turn it around or remove it from the track. The cars are run under train orders, the driver acting as engineer and the superintendent as conductor.

To Tax Cars for Roads.

At its recent session the Ecuadorian Congress enacted a law providing for a public highway leading from the city of Guayaquil toward the interior, which will be the first ever constructed in the lowlands of the republic. The road will extend from Guayaquil northward for about 20 miles to the town of Pascuales on the Daule river.

The funds provided include a monthly tax of 2 sucres ($0.97 at normal exchange) on each public taxicab and 4 sucres ($1.95) on each private automobile; 3 per cent. ad valorem on each automobile imported into and to be used in Guayaquil; 2 per cent. ad valorem for each carriage imported for Guayaquil; 50 sucres ($24.34) assessment on each lineal kilometer (0.62) mile of property through which the road passes; and such sums of money as the municipality of Guayaquil may appropriate from its own funds.

After the construction of the road shall have been completed, for its upkeep an annual tax of 5 sucres ($2.43) for each kilometer of road will be imposed on the adjoining property; a monthly tax of 1 sucre and 2 sucres ($0.48 and $0.97) on the taxicabs and private automobiles, respectively, used in Guayaquil; and the import duties on automobiles and carriages mentioned above, which are to be collected by the municipality of Guayaquil, which is also authorized to make the necessary expropriations of land, to be paid for by the funds collected.

The municipality of Guayaquil is placed in charge of the construction of the highway, which may be done administratively or by contract. Doubtless this is the beginning of a plan to construct public highways in the Ecuadorian lowlands, where they are greatly needed, the credit for which is due to the advent of the automobile.

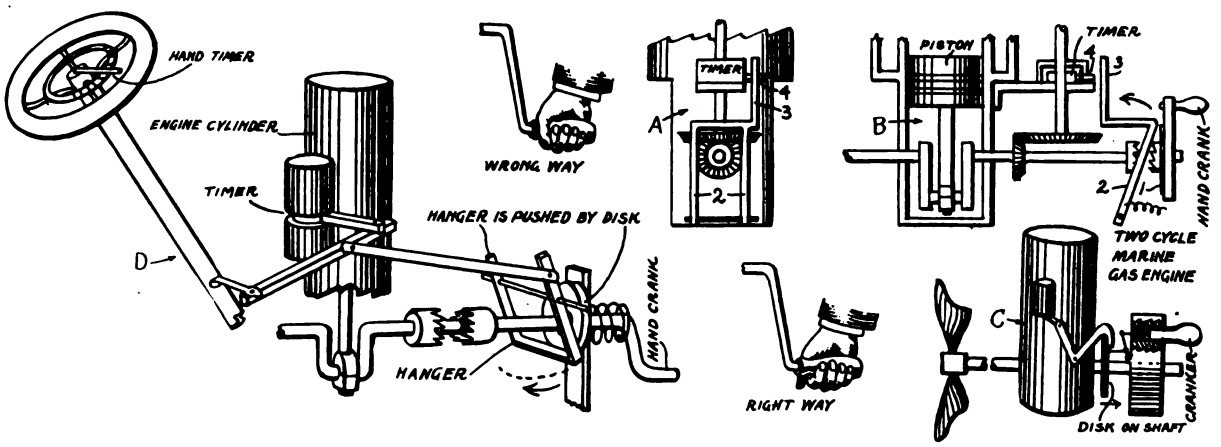
SAFETY CRANKER.

A Mechanical Device for Preventing Back Kicks of Crank.



BY A. A. WEST, M. E.

A back kick or reverse movement of the starting crank of a gasoline engine is possible when the spark occurs and the mixture ignites before the piston attains top dead center or completes the compression stroke. When the mixture is thus ignited the piston is driven downward by the expansion of the gases, reversing the direction of rotation of the crankshaft. Consequently the starting crank will rotate to the left or anti-clockwise, when normally it runs or rotates the crankshaft of the engine clockwise or in a right hand direction.

If the driver cranks the engine with the thumb on the handle and opposite to the fingers, as shown, a backfire is very likely to result in injury. One is less likely to receive an injury if the engine be cranked with the thumb on the same side of the handle as the fingers, as generally the handle is jerked out of the hand, although it is possible for the flying handle to revolve and strike the hand or wrist.

Back kicks are generally due to the driver forgetting to fully retard the spark lever before starting the engine. The device shown in the accompanying will, if properly attached, prevent a back kick. It consists of a disc attached to the starting handle, a pivotally mounted hanger and suitable linkage. The operation of the device is as follows:

When the starting handle is pushed in the disc imparts a reverse movement to the hanger which, in turn, actuates the linkage between the hanger and the timer or commutator. This results in turning the timer to a fully retarded position. Three views are shown of the device which can be constructed by any repairman or mechanic and at little expense. The application of the device to a two-cycle engine is also shown in the drawing.

Illustrating Construction and Operation of Device for Automatically Retarding the Spark and Preventing a Back Kick of Starting Crank.

INCREASES 29 PER CENT.

utput of Crude Oil in 1917 Shows a Gain Over 1916.

The official figures given out by the Bureau of ines shows that the supply of crude oil for the calidar year of 1917 increased 29 per cent. over that 1916. This represents a daily increase of crude oil 196,905 barrels. In 1916 the daily average was 4,849 barrels. In the first six months of 1917 it was 796,106 barrels and the last three months it was 871,774 barrels.

These figures are reassuring despite the fact that there is a scarcity of new wells, labor for sinking same and material for piping, etc. There has been an increase in the storage supply of gasoline. Between June 30 and September 30, a three months' period, the stored supply of gasoline was drawn on to the extent of 77,217,782 gallons. The outputs of the different refineries for the first six months of 1917 show a daily average of gasoline of 6,763,457 gallons. The total output of gasoline during the period was 1,224,182,157 gallons.

Magistrate Warns Pedestrians.

A New York magistrate is issuing a series of Safety First bulletins. The thirteenth deals with pedestrians of the "You-dare-not-run-over-me" type. The bulletin is as follows:

"A pedestrian should always remember that an automobile or other vehicle has as much right on a street or highway as he has.

"Do not put all the burden of care and prudence upon the operator or driver. You are required to use the same care and caution.

"In crossing a street or highway never assume the 'You-dare-not-run-over-me' attitude. If you do you may create a situation beyond the control of the operator or driver.

"Remember an operator or driver has rights which you must respect."

NEW BOOKS RECEIVED.

Acknowledgment is made of the following books and house publications:

Bearing Engineering for Tractor Designers. By C. M. Eason, manager tractor bearings sales division Hyatt Roller Bearing Co., Detroit, Mich. Contains diagrams, data sheets, etc., for engineers and designers.

Bakelite Micarta-D Gears and Pinions. Westinghouse Electric & Mfg. Co., East Pittsburg, Pa. Technical information regarding gears and pinions and including tables of pitch, teeth, etc. Will be sent to engineers and designers.

Eye Hazards in Industrial Occupations. National Committee for the Prevention of Blindness, New York City. Contains statistics of interest to manufacturer as well as the layman and deals with protective devices, etc., and their installation. Price 50 cents.

Du Pont Magazine. House Organ published by E. I. Du Pont De Nemours & Co., Wilmington, Del. Price 50 cents the year.

Safe Practices. Publication issued by National Safety Council, Chicago, Ill. Deals with accidents, hazards and best practices for their elimination. Ten cents the copy.

Westinghouse Automotive Equipment. A special publication describing generators and ignition units for automobiles, trucks, tractors, motor boats, etc. Published by Westinghouse Electric & Mfg. Co., East Pittsburg, Pa. Copies will be supplied at any of the Westinghouse offices.

Empire Tire Dealer. House organ published by the Empire Rubber & Tire Co., Trenton, N. J., in the interests of Empire tire dealers and salesmen.

Standard Parts Messenger. House organ published by the Standard Parts Co., Cleveland, O.

Endurance News. House publication published by the Endurance Tire & Rubber Co., New Brunswick, N. J.

OFFERS USE OF TRUCKS.

M. C. Schweinert Suggests Practical Plan for Relieving Coal Famine.

M. Charles Schweinert, treasurer and manager of A. Schrader's Son, Inc., Brooklyn, N. Y., makes a practical suggestion for relieving the coal situation in New York City. He suggests that the owners and operators of motor trucks place their cars in a special service of transporting coal from the New Jersey side of the Hudson River to Manhattan. To operate the machines, and handle the coal, Mr. Schweinert suggests that labor released because of the shutdown of industry be utilized in the work. He wired the proposal to President Wilson, Fuel Administrator Garfield and New York State Fuel Administrator Wiggin on the same day the five-day order was made public. The telegram was as follows:

Doctor Harry A. Garfield,
Fuel Administrator,
Washington, D. C.

January 17, 1918.

This is not criticism but simply a suggestion which I hope may help in the present emergency. Instead of making the workers of the country idle for a certain number of days would it not be better to mobilize them for emergency work in this crisis. For instance, for every plant which will shut down through the issuing of your order there are a number of men who could do work at moving coal and loading and unloading the freight cars. By the daily papers we are told that there is a great accumulation of coal at the Jersey shore of New York Bay. Why not mobilize all trucks—especially the automobile trucks—in Greater New York and send them to Jersey for some of this coal, thus relieving the coal scarcity in Greater New York?

In order to get the trucks across the Hudson River put into service every ferry boat in Greater New York. I believe it is true that most of the ferry lines do not operate to their full capacity during the greater part of the day. If their boats were operated full time they could move across the river an enormous quantity of coal, thus releasing the coal cars to return to the mines for more coal. Strong men, accustomed to, or fitted for, outdoor work could be put to work at unloading freight, and I am sure that each concern in Greater New York and the rest of the country affected by the shut-down would be willing to contribute whatever number of men and trucks that are fit for this work, and pay them their regular wages if, through such arrangement the operation of their plants would not be interrupted, but would be permitted to run with such a force as is left.

I think this plan should recommend itself to you if for no other reason than that it will save the working people the wages which they will lose through the shut-down. This would cause unthinkable suffering. Besides this at this time we should not create idleness but rather use our labor in such a way as to speed up the prosecution of the war. We should follow the example of France at the Marne and under an extraordinary condition do something extraordinary. France by using means unthought of before to move her soldiers stopped the German advance. We should try in this crisis by unusual and unthought of efforts to relieve matters and not sit down and rest in idleness. Our concern offers four motor trucks, 30 men, two men for engine room work on ferry boats and I personally am willing to serve in any capacity should you desire my services.

M. CHARLES SCHWEINERT.

More Mechanics Needed.

The Ordnance Department of the Army urgently needs several thousand civilian workers and is issuing a poster defining the positions, salaries, etc. The mechanical trades positions are as follows: 2,500 machinists, $4.00 a day; 500 machine operators, $2.75 a day; 200 drop forgers, $5.75 a day (piecework), and 300 tool makers at $4.50 a day. For further information apply to the representative of the United States Civil Service Commission at the post office or custom house in any city, or to the Civil Service Commission in Washington, D. C.

Increase Prices for Work.

At the annual meeting of the Bloomington, Ill., Automobile Trade Association it was voted to increase the charge of work by first class mechanics to 90 cents per hour, and for helpers to 70 cents per hour. The former charges were 75 and 50 cents respectively. Increasing overhead expense is the reason for the advance. The following were elected officers for the ensuing year: J. E. Lockwood, president; F. H. Cole, vice president; E. E. Pierson, secretary; J. E. Clark, treasurer.

Flechter Opens Branch.

L. V. Flechter & Co., well known New York carburetor manufacturers, have opened a factory branch in Detroit at 790 Woodward avenue. George K. Parsons has been appointed manager in charge of all factory sales.

The Flechter carburetor has been known to the trade since 1910 and is manufactured in the plant of the Neptune Meter Co., Long Island City, N. Y. The capacity is 2,500 carburetors per day.

J. Herbert Ballantine and J. Bayard Kirkpatrick are president and treasurer of the Flechter company, and Andrew Kirkpatrick, vice-president and secretary, has spent 17 years in the automobile business.

The company manufactures a special model for Fords known as the Trident, in addition to models for all cars.

Red Cross Wants Drivers, Etc.

More than 1,000 motor truck drivers, mechanicians and helpers are needed immediately by the American Red Cross for service in France. The duties of these men will be to operate and repair the Red Cross motor trucks which transport supplies to war hospitals. Men in this service will receive pay and expenses.

A recruiting office has been opened at the headquarters of the Atlantic Division, 44 East 23rd street, New York City, under J. Lee Skelly, of the Red Cross Foreign Transportation Department Recruiting Service. Applicants must be over thirty-one years of age.

Dealers Close Evenings.

The leading dealers of Grand Rapids, Wis., have eliminated night and Sunday service in order that overhead expense may be reduced. The dealers afford service by designating a down town garage as an emergency service station for all dealers, and have notified car owners of the plan. About 5,000 owners are affected by the new arrangement. The down town garage makes minor repairs and adjustments, but work that cannot be accomplished in a short time is turned over to the proper dealer at the beginning of the next working day.

Indiana Votes for Cash.

Dealers in Vincennes, Ind., have adopted a cash basis of doing business. They ran a display advertisement in the newspapers announcing the new plan to the motorists. It was stated that by paying cash any raise in prices can be avoided. It was also pointed out that the elimination of bookkeeping cuts down the dealer's overhead. The majority of the dealers signed the statement appearing in the press.

To Drive Cars Over the Road.

The shortage of freight cars is to be discounted by one well known Detroit manufacturer of passenger cars. Beginning March 1 cars will be driven over the road and the cost is to be charged to the customer. It is estimated that the expense attached to this method of delivery will be about $150 for New York buyers.

Figuring the Tractive Resistance on Various Road Surfaces

The draft required to move a loaded wagon on different types of road has, of course, been made the subject of repeated investigation, but so far as is known no determinations have been made with reference to the various types of road which are to be found in California under soil and weather

TYPES OF ROAD TESTED.
EARTH ROAD, dust ¾ to 2 inches deep.
EARTH ROAD, stiff mud, firm underneath.
GRAVEL, compact, in good condition.
GRAVEL, loose, not packed.
WATER-BOUND MACADAM, good condition.
OIL MACADAM, new, good condition.
CONCRETE, unsurfaced, smooth.
CONCRETE, ⅜-inch top, asphaltic oil and screenings.
CONCRETE, 1½-inch Topeka top.
TOPEKA TOP, 1½-inch, on plank. Approach to causeway.

conditions which here exist. It is common knowledge that cheap makeshift patchwork road building and maintenance are expensive, and in California, perhaps more than in any other place, the public conscience has awakened to the economic value of the good road. But, insofar as relates to the waste of power and the waste of money incident thereto, which result from hauling heavily loaded wagons or trucks day after day and year after year, over bad roads, no report is extant which attempts to picture, in popularized form, the economics inherent in the high-type, modern, hard highway as opposed to mud or dust or ruts.

An Efficient Committee.

In planning the tests herewith reported, the good roads bureau of the California State Automobile Association was fortunate in securing the interest and co-operation of Professor J. B. Davidson, of the Agricultural Engineering Division of the University of California; his assistant, L. J. Fletcher, with Austin B. Fletcher, Engineer of the California Highway Commission, and a national figure among road builders; C. H. Sweetser, District Engineer of the U. S. Office of Public Roads and Rural Engineering, and W. H. Lynch, Senior Highway Engineer, of the same office.

Same Equipment Used.

The purpose of the tests was to determine the tractive resistance of a standard farm wagon, when loaded, on various road surfaces. As far as possible all factors influencing the tractive resistance of a loaded wagon, except the road surface itself, were either eliminated or maintained constantly throughout the tests. Thus one wagon with the same load was used and was drawn by a team in all the tests reported here, except those on an oil macadam road, where a motor truck was used. The tests were made on June 13, July 9 and 10. The weather was bright and sunny in each case and the highest temperature for each day was about 105 degrees. The warm weather was the occasion for an increased tractive resistance on the oil roads over that for average temperatures.

Used a Dynamometer.

An appliance known as the Iowa dynamometer was used. This dynamometer was designed by Professor Davidson while on the staff of the Iowa State College.

In order to insure absolute accuracy in these tests, the particular instrument employed was subjected to careful inspection in the Engineering Laboratory of the University of California at Berkeley before being utilized.

The tests were made in part at the University Farm of the University of California, near Davis, Yolo county, and upon the State highway in the vicinity and over various county roads and stretches of the State highway in Sacramento county near Sacramento.

Various Roads Tested.

The various roads chosen for experiments fairly represent the roads of California under summer weather conditions, the readings made on the muddy earth road being made possible by an overflow from an irrigation ditch on the University farm at Davis and merely intimating, rather than conclusively picturing, the pull per ton necessary to move a loaded wagon over, or rather through, mud.

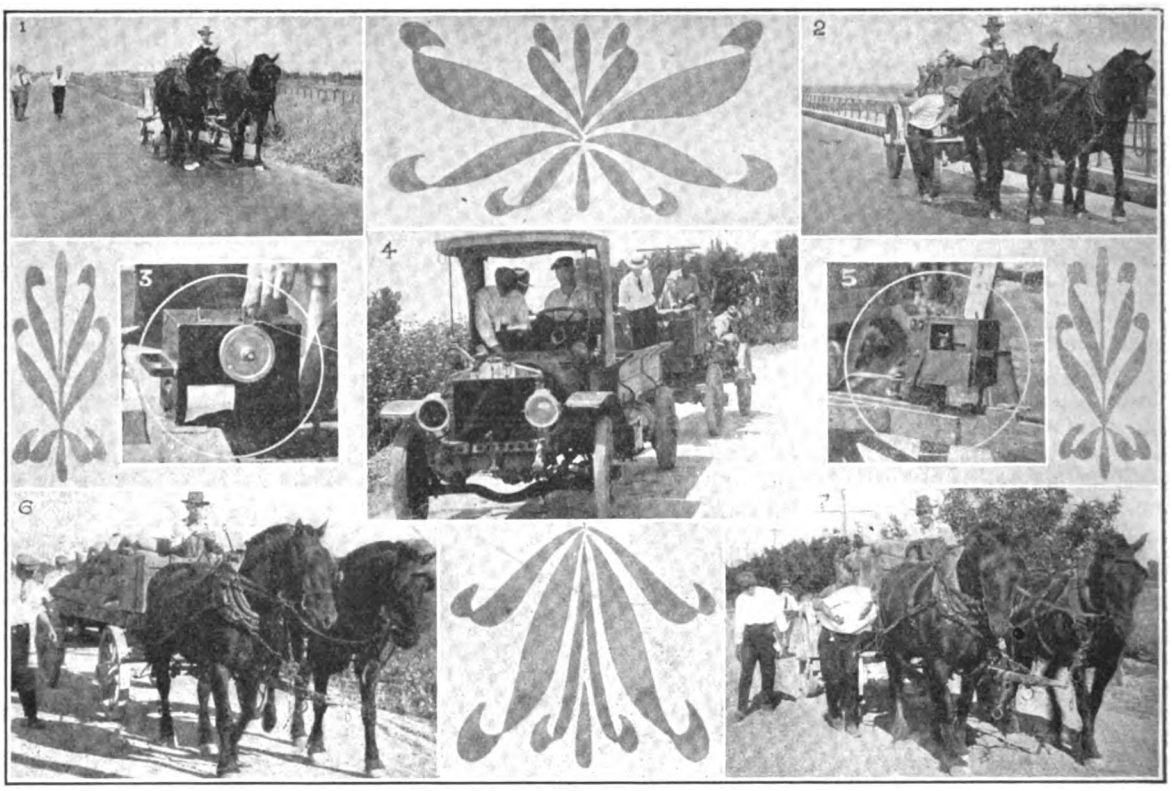
The tests were held uniformly with a load of 6,000 pounds gross, which was made up of a standard farm wagon loaded with California rice in sacks. The motive power used in the tests at Davis was supplied by a fine team of draft horses weighing about 1,600 pounds each, wagon and horses being the property of the University of California. In the tests made in the vicinity of Sacramento a standard two-ton truck, the property of the California Highway Commission, was used, through the courtesy of Austin B. Fletcher, Highway Engineer. So far as possible, all conditions were kept uniform except road surface, the same wagon, the same load, the same driver and the same horses being employed

PULL IN POUNDS PER TON	
Over a level, unsurfaced concrete road	27.6
Concrete base, ⅜-inch skin top asphaltic oil and screenings	49.2 to 51.6
Water-bound macadam, level, good condition	64.3
Concrete base, 1½-inch Topeka top, level, good condition	68.5
Gravel road, good condition, level	78.2 to 81.3
Earth road, fine dust, level	92 to 99.3
Earth road, stiff mud on top, firm underneath, level	218
Loose gravel, not packed down, new road, level	263

and practically the same speed being maintained in the horse-drawn tests, while the same man drove the truck when it was utilized as motive power.

Factors in Tests.

The rate of travel was decided in each case and averaged 2.4 miles per hour for the team. On grades



Digitized by Google

tests were made both up and down grade and the results averaged.

A standard farm wagon with steel axles of equal length with wheels 38 and 46 inches in diameter and four-inch tires was used.

The load was drawn with a motor truck in the tests on oil macadam.

The dynamometer was of the integrating and recording type known as the Iowa. The force representing the tractive resistance of the loaded wagon acting through the instrument compresses a spring carefully calibrated to indicate the force acting. The average resistance over a uniform distance, measured automatically, is indicated directly by the instrument at the end of the run. A record of the resistance is also made on a strip of paper drawn under a recording pencil; this record so provided is used to check the average results furnished by the instrument. The tests were started after the load was in motion and moving at a uniform rate.

Ascertaining the Tractive Resistance on Various Road Surfaces: 1—Concrete, Asphaltic and Screenings; 2—Concrete Base and Topeka Top; 3—Showing Arrangement of Dynamometer in Horse Drawn Tests in Which Pull Is Transmitted from Doubletree Through Dynamometer to Clevis; 4—Unsurfaced Concrete; 5—Showing Arrangement of Dynamometer for Motor Drawn Test; 6—Water-Bound Macadam; 7—Gravel Road, Packed.

Upsets Earth Road Theory.

In reviewing the tests made, it is to be regretted that it was impossible to get a comprehensive series of readings over muddy roads, such as the average farming community is blessed with in winter, the "muddy road" tested being a mere hint of the hub-deep mud which wet weather brings.

In testing the pull necessary to move the load over the earth road the results arrived at upset the theory once expressed by the Governor of one of our States, who declared that "the good earth road" was easier to pull over than any other type of road. This contention did not prove up, for the tests made by Professor Davidson showed that the pull required was 3 1/3 times as great as over unsurfaced concrete and nearly twice as great as over concrete with the ⅜-inch skin top.

How Energy Is Wasted.

Comparison between the lowest pull recorded, that necessary to keep the three-ton load moving, after it was started, over the level, unsurfaced concrete road, which amounted to 83 pounds or 27.6 pounds per ton, and the pull through stiff mud, which was 654 pounds for the load, or 218 pounds per ton, furnishes ample food for thought. Over the concrete road the horses pulled together 83 pounds, each horse pulling only 41½ pounds, while over the mud the team pull was 654 pounds and the pull on each horse was 327 pounds. The difference in pull between the concrete road and the mud road was 571 pounds, a difference of 285½ pounds pull for each horse, which is wasted energy, wasted as absolutely as if it never had existed; and this energy, wasted day in and day out, in the winter in every part of almost every State in the United States, is what is meant when Bradstreet's Agency, with its fingers on the business pulse of the nation, says: "Bank clearings (in New York, Chicago or San Francisco) were affected by the usual seasonal condition."

How It Affects Business.

The "usual seasonal condition" is mud. Mud makes business bad in the country store because the farmer cannot get to town either to buy or sell. Bad business in the country store makes bad business in the country bank, and bad business in the country bank finds immediate reflection in financial centers, where bank clearings fall off and the city merchant finds his business dull because the country merchant, 200 miles away, perhaps, has found his business dull on account of bad roads.

Digitized by Google

When forced to go to town in winter through the usual "seasonal mud" the farmer can haul only one-eighth the weight, so our tests prove, that would be possible had he concrete roads to travel over such as the California Highway system supplies. His marketing costs are therefore increased eight times, this increased cost being passed along to the average ultimate consumer, whose good wife, engaged in stretching his salary to limits that no rubber band would stand, ponders on the high cost of living, makes one dollar do the work of two, performing miracles of finance, never realizing that she is affected even in the most remote degree by the "usual seasonal condition" which commercial agencies speak of as affecting "bank clearings."

Why the Good Roads.

Yet she is. Supply the farmer with a modern road that he can travel over every day in the year instead of when weather permits, that he can haul over with absolute economy instead of never-ending waste, and the resultant decrease in hauling costs, estimated by the United States Office of Public Roads and Rural Engineering as more than $200,000,000 every year which we pay out in tribute to bad roads, would enable that greatest of our institutions, the American Wife and Mother, to take a little additional comfort for herself, to give a better education to her children, to make the wages of the family's breadwinner go farther with something left over to tuck away in the savings bank for that rainy day.

In extension of the tests here pictured it is the plan of the Good Roads Bureau of the California State Automobile Association to make a series of tests of muddy roads, under usual "seasonal conditions" common in winter, that the high cost of mud may be made yet more plain. Professor Davidson has pledged his co-operation in this plan and a supplementary pamphlet will be published in due time.

PRACTICE ECONOMY.

Boil Greasy Units in Soda Solution, Reclaim Oil and Old Rags.

The grease removed in the cleaning of wheels, axles and other parts of motor omnibuses, trucks, and other motor vehicles, is now utilized by the London General Omnibus Co., London, England.

Before the war kerosene was largely employed for the cleansing of engines and other parts of vehicles, but now its consumption is restricted to the barest minimum, the net effect being the saving of five-sixths of the former consumption. Kerosene, as a matter of fact, is now only employed on certain parts of the mechanism for the cleaning of which there is no practical substitute. For the cleaning of wheels, axle casings, and front axles, a weak solution of hot caustic soda is employed.

When engines, transmissions, rear axles, or any other parts are stripped for overhaul, a very great saving is effected over former practice.

Use Soda Process.

The unit is dismantled and the parts are placed in a cradle and dumped into a tank of water into which a jet of steam is turned so as to bring the water to boiling point. Custic soda is added to the water until a solution of about three per cent. strength is obtained. The whole of the grease is removed from the parts in the process of boiling and comes to the top of the water. Before the contents are removed the grease is drawn off the top. This is done through an overflow pipe of large diameter which leads into a barrel.

The cradle of parts is then transferred to a second tank of clean, boiling water, which finishes the cleansing, and, as the parts are drawn out quite hot, they drain perfectly dry and absolutely clean.

The result, so far as cleanliness of parts is concerned, is considerably better than if kerosene had been used. All minute parts of metal, dirt and grit go to the bottom of the first cleansing tank, where there is a large drain cock, the tank occasionally being washed out and all the sediment drawn away.

Reclaim Oils.

The London General Omnibus Co. has a central depot for reclaiming oil and washing rags, and to this depot the barrels of waste oil, as they are obtained from the various garages, and the rags, are sent.

At this depot there is a battery of three tanks erected over a furnace, each of which is filled to about two-thirds with water, which is brought up to the boiling point. The barrels of oil as they come in are drawn off into the first boiling tank, a little being added at a time. The oil is thoroughly boiled, and when it overflows into the second tank (by the adding of more oil to the first) it has become almost fit for use again, but it passes into the second tank and is given a second boiling, and then on to the third tank, where it goes through its final stage of cleansing, and from the last tank it is drawn off and run into barrels.

Renovate Oily Rags.

As to rags, their price today is much higher than before the war, when they were thrown away after being used. At present every rag is collected in each garage and sent once a week to the central cleaning depot. The first process through which they go is the extraction of all grease and oil in a centrifugal steam-heated chest like those in the ordinary dry-cleaning establishments in this country. All oil, by the rotary action of this chest, is expressed from the rags, whence it runs into barrels for the reclaiming process already described. The rags are then put into a washing machine and later into a rotary drying machine.

Oil Used as Fuel.

The oil gained by the reclaiming process is not entirely suitable for use again as a lubricant, but as so much of it comes from a solid grease, it is of a better quality than cleansed engine oil. It still has a value as a fuel, however, as can be gathered from the fact that at the North Road coach factory of the London General Omnibus Co., two 80 horse-power Diesel engines are run from the output of the oil reclaiming depot, leaving a certain quantity in excess available for sale. This oil is particularly good for Diesel engine work. It leaves the cylinder heads and valves very clean and is entirely satisfactory.

The cleansing plant of the London General Omnibus Co. has paid for itself in a very short time, because oil reclaimed may easily be sold for blending or fuel. A small plant can be easily put up in any garage, fuel for the furnace being rubbish and shop sweepings, or if the "raw material" is too small in quantity for economical handling on the spot, it could be collected and dealt with in larger bulk at some central collecting place.

Digitized by Google

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.
The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusable accident of a collision at a railway crossing.

Skidding and carelessness in attempting to cross railroad tracks ahead of trains were responsible for the usual crop of accidents that could have been avoided. Accidents caused by failure of the brakes to hold as well as those due to failure of other components, were noted during the past month. Skidding can be avoided by the use of chains and proper driving. At this time of the year when the city streets and country highways are covered with snow and ice, one should not only proceed with caution, but should see that the wheels are equipped with some device affording safe traction.

Too Much Speed.—A new and slippery pavement proved the undoing of a driver near South Keyport, N. J., recently. Five persons were injured when the vehicle turned turtle. It is said that the car was being driven at a high rate of speed in a fog and that a sharp turn in the road started the skid.

Brakes Failed to Hold.—Failure of the brakes to hold was responsible for an accident just outside of New York City. The machine crashed into the rear of a car going in the same direction, injuring several persons.

Drives Into Street Car.—One killed and two hurt is the result of a driver attempting to cut in back of and around a street car in Chicago. The motor car crashed into a trolley approaching in the opposite direction.

Struck by Freight Train.—Failure to notice the approaching freight train and attempting to cross railroad tracks, were responsible for the destruction of a car and the injuring of two persons near Bucyrus, O., recently.

Skid Into Pole.—Four persons were injured and a car demolished near Youngstown, O., when the driver lost control when making a turn at high speed. The car skidded into a pole.

Struck Soft Spot in Road.—A driver of a small and popular type of machine reached over to adjust the robe about his companion when the car struck a soft spot in the road. The vehicle turned turtle, injuring three persons.

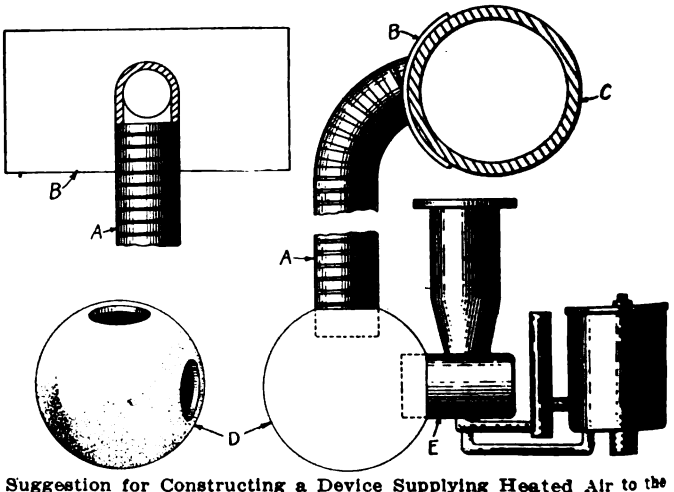
Sideswiped Other Car.—The tendency to pass another car and going in the same direction resulted in the death of one person and the injuring of others at Sacramento, Cal., recently. The driver, in attempting to crowd the other vehicle, crashed into it, and both cars left the road.

Curtains Obscure Vision.—Driving with curtains up and failure to hear the whistle of an approaching train, caused the death of a driver of a motor car and his companion near Burlington, Ia. The engine struck the automobile, completely wrecking it.

Skid Fatal to Pedestrian.—The skidding of a motor car not equipped with chains resulted in the death of a well known business man at Baltimore, Md. He was standing at the curb when the automobile skidded into him. It appears the car was taken out by the 17-year-old son of the owner.

Blown From Car.—An unusual accident took place near Littleton, Mass. The car was struck by a train at a crossing and the force of the collision burst the fuel tank, the contents of which exploded, blowing the occupants of the automobile several feet. Both were dead when picked up.

Made Too Quick a Turn.—A skid that is believed to have been caused by the driver making a quick turn when he realized he was about to take the wrong road, was the cause of the death of one person and the injuring of two others near Columbia, O. The car turned turtle.



HEATING THE AIR.

Simple Method of Conveying Heat of Exhaust to the Carburetor.

A novel and ingenious method of conveying the heat of the exhaust manifold to the air intake of the carburetor is described by a writer in the Autocar. The arrangement of the parts has been slightly altered in the accompanying sketch, a tube of flexible metal being employed instead of that suggested.

The stove partially encircling the exhaust pipe or manifold is constructed of sheet tin as shown at B and attached as indicated at C. The flexible tube is secured to the stove and wires can be utilized for attaching the stove. A slight space should be left between the exhaust pipe and the stove.

The connection between the tube and the air intake of the carburetor is obtained by the use of a tennis ball. Two holes are cut in the ball and at right angles, as shown at D. The free end of the

Suggestion for Constructing a Device Supplying Heated Air to the Intake of the Carburetor.

tube is inserted in one opening and the other aperture of the ball is slipped over the air intake, as at E. With some types of carburetors and where the air valve used for choking interferes with applying the ball as suggested, it will be essential to use a short length of tubing. The entire construction can be made up in about 30 minutes, and hose can be substituted for the flexible metal tubing.

Record Display of Accessories Expected at Boston Show, March 2-9

The sixteenth annual show of the Boston Automobile Dealers' Association will be held March 2-9, inclusive, as originally planned. The suggestion that the dates be advanced, owing to the fuelless Monday, did not prove acceptable to the scores of car, truck and accessory exhibitors, the majority of

Chester I. Campbell, Manager of the Boston Show.

whom had signed contracts and completed arrangements for their exhibts. There is every reason to believe that the fuelless Mondays will be a thing of the past by the time the opening day of the show arrives.

New England Prosperous.

Although not officially a national show, Boston has come to assume almost as great an importance among manufacturers as the New York and Chicago events. New England is a field carefully cultivated by the manufacturer, for it represents a big purchasing power that is steadily increasing. Dealers predict that the season of 1918 will be unusually prosperous, that there will be a big demand for popular and medium priced cars, and that the majority of sales will be to persons making their initial investment in a motor vehicle. These predictions are based on the assumption that skilled labor is receiving an unprecedented wage. New England is well known as a manufacturing center. Dealers and garagemen also anticipate a big demand for accessories and equipment as the result of a decreased production of passenger cars.

Big Show for Dealers.

Boston enjoys the distinction of being a dealers' show, although the manufacturer displays a keen interest in it. Not only do the individual exhibits afford an opportunity for the display of individuality and ingenuity, being free as is the show from the restrictions governing shows held under the auspices of the National Automobile Chamber of Commerce, but the Boston event draws the dealer, garageman and repairman, large and small, for miles around.

From the standpoint of exhibits and interest taken the Boston show is a surety of success. Every inch of the 125,000 square feet of space in Mechanics building has been taken, the "all sold" sign having been displayed for the past month. The overflow will be housed in Horticultural Hall, several blocks distant.

Best Commercial Car Show.

Boston enjoys the distinction of being the only big show where commercial vehicles are displayed, and in large numbers. Last year over 50 makers of trucks were represented and a number of new models were displayed for the first time. There is every reason to believe that a number of manufacturers will wait until the Boston truck show to exhibit new vehicles, a practice indulged in by makers of pleasure cars, accessories and equipment.

With favorable weather it is expected that the attendance of last year will be exceeded. In 1917 approximately 200,000 visited the two buildings, in which there were 512 passenger and commercial vehicles displayed. The number of exhibitors of passenger cars was 92, while accessory makers to the number of 170 were represented. These figures are exclusive of the separate display of enclosed bodies, etc., held at the Copley Plaza. In addition to the events enumerated there will be the usual exhibits by large dealers, etc., at their show rooms.

The display of accessories, equipment and those devices of interest to the trade will be much larger and more comprehensive than it in the past. This is due to the fact that the Motor and Accessory Manufacturers' Association has recognized the show, and placed its seal of approval on it. This means that many manufacturers will display, whereas formerly their products were shown by agents, etc.

"Florentine Fete" Decorations.

Chester I. Campbell, manager of the Boston Show, has always enjoyed the distinction of staging a beautiful background for the exhibits. The scheme of decoration this year in the grand hall will be Florentine, and the designer, E. W. Campbell, describes it as a "Florentine Fete," founded on the bronze and art work of the city of Florence, Italy.

Exterior of Mechanics Building, Boston, Where the 16th Annual Show of the Boston Automobile Dealers' Association Will Occur, March 2-9.

Digitized by Google

The balconies will be draped in old rose fabric with large gilded and modeled frames holding Florentine bas reliefs in bronze. Between the frames will be place bronzed torchholders filled in with ferns and festooned in color. The balcony opposite the stage will be treated with finely modeled statues.

Bronze Gates and Cherry Blossoms.

Three sculptured fountains with running water will be placed at the entrance to the stairway to the stage, which will be lined with boxes of trimmed hedges with marbleized panels. The rear wall of the stage will be covered with artistic panels having an old rose velour effect. The main division lines on the floor will have bronze gates 12 feet high, with cherry trees in bloom on either side and meeting across aisles. The lighting effect, from huge electroliers, electric ball and electric festoons, will produce a dazzling scene.

A Patriotic Tone.

In Exhibition Hall all the posts will be treated with highly decorated medallions, the windows and side walls to have fretwork design and rich coloring. Panels with rich decorative color scheme will extend from the floor upward to reach festoons clear around the hall. The exhibits will be set in shrubbery. The entrance corridors will be decorated in national and allied colors, with new palms and colored drapings.

AN IMPORTANT QUESTION.

Must Subscription Rates Be Raised to Offset Increasing Costs?

We are beginning to hear from our subscribers with respect to the inquiry we made in the January number as to whether very many of them would object to a raise in our subscription price from $1.00 to $1.50, in case that should become necessary the first of July next, when the new second-class postage law becomes effective and increases our postage to a point where it will be unprofitable to accept subscriptions at old rates.

We are receiving some very encouraging letters. One subscriber, B. E. Riker, Branchville, N. J., writes as follows:

"In regard to the increase of subscription to The Automobile Dealer and Repairer, would say that I do not hesitate when my subscription expires to send the dollar with pleasure, and if it was $1.50 or $2.00, it would be the same, as I am sure I am getting big value for the price. Further, the information that I get from the 'Trouble Department' in one issue is worth more than the price of subscription. I had trouble with my car for over a month when by accident I discovered the difficulty and repaired it. At another time I had to be towed in on account of a little wire trouble that could have been fixed in five seconds, but I was green and didn't know much about automobiles, though I had run a locomotive for a number of years, and considering myself somewhat of a machinist, thought I would have no trouble, and I didn't as long as the car went; but when the car stopped, there I was and had to be towed in. It was one of those short-circuits which could be repaired quickly. A short time after this little trouble I have described, I received a sample copy of The Automobile Dealer and Repairer and in the Trouble Department I found the same inquiry, and you bet that I was not long in sending in my subscription. The Trouble Department in one issue has been worth five times the subscription price to me."

We hope our readers universally will comply with the requests made in our previous issue (and repeated now) to give us their opinion of the proposed increase in subscription rates. It is well known that everything has advanced in price and in some cases the increase is pronounced. White paper costs nearly twice as much as it did before the war. Printers are charging considerably more for their work, and postage is going to be very much higher.

It would seem as though there should not be any serious objection to a reasonable increase in the subscription price of The Automobile Dealer and Repairer, but we want to know what our readers think about it, because to increase the subscription rate is rather a serious step to take. We do not want to make any mistake. Although a good many readers have responded to our request, there are numbers of others that we should like to hear from as soon as possible.

Jellinek-Mercedes Is Dead.

Emile Jellinek-Mercedes, the man responsible for the name Mercedes in the automobile, motorboat and airplane industry, is dead. He was a wealthy Austrian who from 1880 to the outbreak of the war resided at Nice in Southern France. He secured control of the Daimler Motor Co. of Caunstatt, Germany, claimed credit for having inspired Mayback, chief engineer of the Daimler works, with the construction of a light but powerful chassis. The chassis weighed less than 2200 pounds and was equipped with an engine developing 40 horsepower. The Daimler product weighed over 4,000 pounds and developed but 28 horsepower. The car was named after Jellinek's daughter, Mercedes.

TO CARRY LOAD BOTH WAYS.

Plan for Motor Trucks to Operate Efficiently in Several States Approved.

That economical operation of a motor truck depends largely upon the vehicle carrying a capacity load both going and coming, is the basis of the plan to be adopted by four states, New York, Pennsylvania, Massachusetts and Connecticut.

Representatives of the Council of National Defence of these states met recently in New York and laid the foundation of a plan whereby trucks operating between two given points will be so employed that a load will be carried both ways.

The plan includes the forming of central bureaus where truck drivers may report and be assigned loads for return trips instead of returning empty as is now the case. The practice of using trucks as above stated is indulged in by a few concerns and there is every reason to believe it will become very general before spring.

Ford Dealers Organize.

Dealers handling the Ford in northwestern Wisconsin have organized. The Fox River Ford Dealers' Association, as the new organziation is termed, elected W. C. Dicke, Manitowoc, as president. H. M. Bradford, Appleton, at which place the meeting was held, is secretary and treasurer.

Adapting the Incandescent Lamp to the Needs of the Motor Car

Part 1—Describing the Early Attempts to Utilize Electricity for Lighting Purposes and the Development of Filaments and Lamps

BY AUGUSTUS A. WEST

The utilization of electricity as an illuminant for motor vehicles is now so general that the average motorist accepts its conveniences as a matter of course. Electric lighting was not developed by the automobile industry. As a matter of fact, the compact dynamo, storage battery and incandescent bulb were perfected long before the public demanded a more convenient form of illuminant than the kerosene lamp or acetylene gas.

The history of the development and use of electricity for lighting purposes is an interesting one, particularly that dealing with the perfection of the lamp or bulb. While it may appear to the novice, the person purchasing his first electrically equipped automobile, that all bulbs or lamps are similar, such is not the case. These bulbs vary in size, capacity and construction, and a practical or working knowledge is of value to the owner, dealer and repairman.

Knowing how to select the proper bulbs and to wire a car will be of service to those motorists whose cars are not equipped with electric lighting as well as of value to owners who wish to attach some device, a spotlight, for example. The reader will find the article on pages 49 and 50 of the January issue of value in that many of the electrical units herein referred to are explained in detail.

Bulbs, globes and incandescent lamps are one and the same thing, and when we go to the dealer or garageman for them we seldom give a thought to their construction. It is the intention of the writer to explain how lamps may be selected for a specific purpose. While the dealer and garageman have charts showing just what lamps should be used for certain makes of cars, the owner, as a rule, is not aware what voltage, amperage capacity, etc., should be adhered to.

The Ediswan Lamp.

Prior to Thomas A. Edison's commercial incandescent lamp there was a somewhat similar lamp used in England in a limited way by Swan. When Edison sent his new lamps to London, about 1881, he met with opposition in the courts by the Swan interests, but later these clashing elements were merged and the combined feature lamp has since been known as the "Ediswan." Because the incandescent lamp was antedated by the electric arc lamp a description of the latter will be of interest.

The Electric Arc Lamp.

The first invention in electrical lighting was with he electric arc shown at E at Fig. 1. Its principle s that a flaming incandescent arc is produced at he junction of a break in any current carrying onductor of electricity. In 1809 Sir Humphrey)avy, whose lamp is shown at Fig. 1, A, connected ,000 cells or primary batteries to two rods of harcoal and by slightly separating them he obained the first electrical arc light. It created a temperature of 4,800 degrees Fahrenheit. The next step was the replacing of the expensive, zinc-consuming primary battery with the mechanical production of electricity, the dynamo. In 1878 Charles Brush patented his arc lamp and dynamo. He made a good commercial arc lamp having an electrical-gravity carbon rod feed, and a dynamo and motor of peculiar design. About this time Edison was marketing his system of electric incandescent lighting and these two American inventors were great commercial rivals for a while, but it was soon found that the arc was especially valuable for street lighting, using as it did a series, direct current. The incandescent lamp proved best for interior lighting, using a direct current in multiple wiring. Later the alternating current supplanted the direct for central

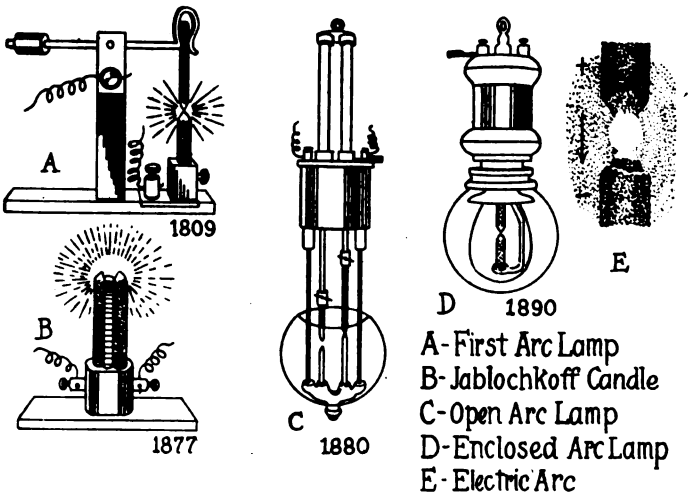

Fig. 1—Early Forms of Electric Lighting, Showing the Development of the Arc Lamp.

station distribution because of its great saving in copper wire size, the feeder mains using high voltage, intermediary rotary converter sub-stations and transformers to lower the voltage on its entrance to buildings. The alternating current motor is a recent improvement, but the speed control of the direct current motor remains superior to the alternating current unit. Thousands of volts are used on main line distribution, whereas automobiles use from six to twelve volts for lighting and a direct current as storage batteries are employed. Referring once more to an enclosed arc lamp, one is shown at Fig. 1, D. It has a partial vacuum and its carbons last about 200 hours as against six to eight hours for the single carbon, open arc type of lamp.

The Incandescent Lamp.

The incandescent lamp owes its lighting quality to its filament opposing a high resistance to the passage of current so that the filament becomes white hot or incandescent when the current flows through it. If this were tried without an air ex-

Digitized by Google

hausted globe the oxygen in the air would burn up the filament, there would be a flash and the filament would be consumed. To overcome this a glass globe is used to surround the filament and the air is pumped from the globe. With the filament in a vacuum the light continues to shine as long as the current flows, assuming the proper voltage is maintained.

The filament material is very important and carbon was formerly used. Carbon is the heat charred remains of certain materials and comes in various forms. Coal is carbon formed by nature from vegetables, plants, trees, etc., under great pressure and heat. Common charcoal is made from logs of wood burned in ovens or buried in the ground. In the process the air is largely shut off. This results in charred wood or charcoal. A diamond is pure carbon crystallized. Other precious stones are partly carbon with mineral additions which give them various colors. Bamboo fiber was chosen by Edison for his early lamps, which he patented in 1878.

The First Incandescent Lamps.

The Philosophical Magazine, 1845, describes a

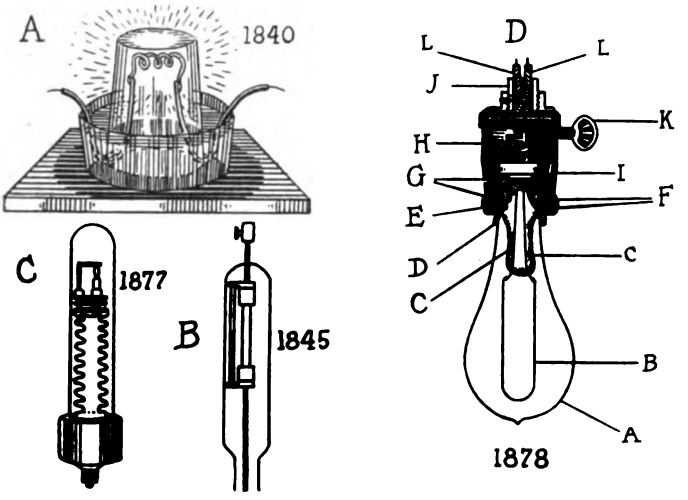

Fig. 2—Illustrating the Early Attempts, A, B and C, to Construct Incandescent Bulbs or Electric Lamps and the Edison Carbon Lamp at D.

lamp invented by William Robert Grove. This lamp is shown at Fig. 2, A.

"A coil of platinum wire is attached to two copper wires, the lower parts of which, or those most distant from the platinum, are well varnished; these are fixed erect in a glass of distilled water, and another cylindrical glass, closed at the upper end, is inverted over them, so that its open mouth rests on the bottom of the former glass; the projecting ends of the copper wires are connected with a voltaic battery (two or three pairs of the nitric acid combination), and the ignited wire now gives a steady light. Instead of making the wires pass through the water, they may be fixed to metallic caps well luted to the necks of a glass globe."

In 1845 August King in England, assisted by the American inventor, Mr. Star, used a platinum and also a carbon burner in a vacuum. They selected a barometer tube for a globe and brought the lamp to a white heat or state of incandescence by electric current from primary batteries. The device is shown at Fig. 2, B. In 1859 Moses G. Farmer, of Salem, Mass., by a series of subdivided electric lamps, lighted his residence. This is said to be the first record of electricity being used to illuminate a house.

In the Sawyer-Man lamp of 1877, shown at Fig. 2, C, a rod of carbon was brought to a state of incandescence in a globe filled with nitrogen gas. In the last few years nitrogen lamps have become popular, due to their great economy of current.

The early lamps of Thomas Alva Edison, those made about 1878, used a very thin, thread-like filament of carbon, made from a great variety of material, including paper, bamboo and carbonized cellulose. His experiments extended over many years and he sent a man around the world collecting material for filament experimentation.

Special Electric Lamps.

The Nerst lamp employs for its incandescent element certain oxides of rare earths; in this respect, somewhat like the Welsbach gas mantle. The oxide is mixed in a form of paste, then squirted through a die into a string, roasted and used as a filament in a vacuum globe.

The mercury vapor lamp, invented by Peter Cooper Hewitt, has no filament. It uses a mercury vapor brought to a state of incandescence in a long glass tube by the passage of electricity. The Hewitt lamp is more economical of current than the filament lamps, but it lacks the red rays of light. Not being fully actinic, it gives objects strange colorings, but is a helpful light for photography and has many special advantages.

The Moore lamp is a development of the Geissler tube for commercial purposes. Geissler tubes are sealed glass tubes of varied shapes, containing highly rarefied gases and provided with platinum electrodes which usually extend through the glass to a short distance beyond the interior surface. When a static electrical discharge, as from a spark coil, is passed through the tube, luminous colored lights are produced.

Filaments and Material.

Among the compounds with carbon may be mentioned "helion" and osminum. The tantalum filament has been found useful. Tungsten is universally employed for incandescent lamp filaments. Tungsten is a metal of the chromium group, it has a very high melting point. It is unworkable as a metal and appears as a dark powder of a gray tint. The Kuzel process of working tungsten consists in forming a colloidal solution of the metal by maintaining an electric arc between tungsten terminals under water. The solution is then brought to a pastelike consistency and squirted through a die into a filament which is afterward treated by heating with the electric current. Its melting point is high, 5,792 degrees Fahrenheit, which is desirable in lamps, but the filament is easily broken by jar, requiring especially strong supports. Further benefit is obtained by using nitrogen gas in the globe instead of simply burning the filament in a vacuum.

The Edison carbon lamp is shown at Fig. 2, D. A is the exhausted globe, B the carbon filament, CC wires sealed in glass, D line of fusion of two parts of the globe, E and F insulating material, G screw threads, H and I metal socket, J fixture arm, K circuit controlling key, LL current supply wires.

(To be continued.)

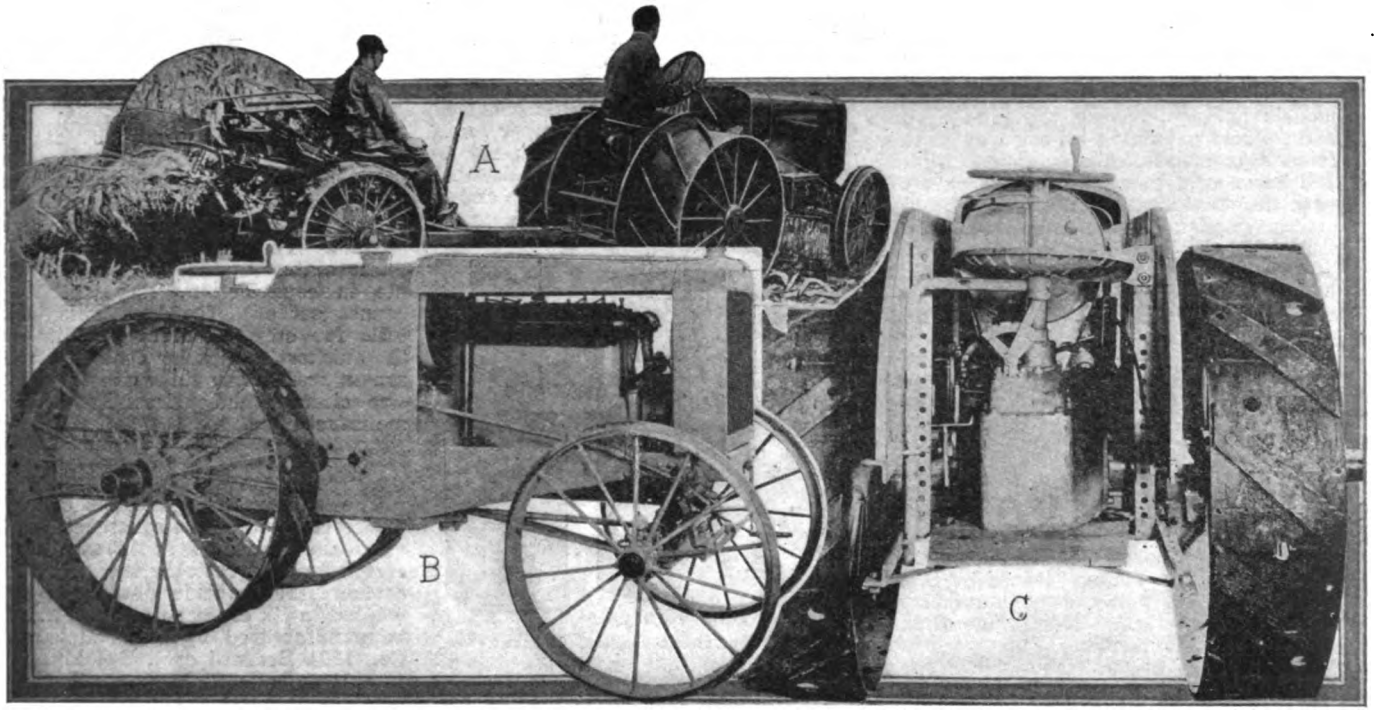
MAXWELL TRACTOR.

Maxwell Company Announces Three-Plow Machine With Enclosed Drive.

Indicative of the general trend of the automobile industry is the announcement of the Maxwell Motor Co., Detroit, Mich., that it is to manufacture and market a tractor. The announcement was made at the Maxwell-Chalmers dealers' dinner during the week of the Chicago show, and the new vehicle was shown by means of motion pictures. These displayed the use of the tractor under the most severe conditions of service.

The new Maxwell tractor is a three-plow machine, employing enclosed drive. Wheels are 48 inches in diameter. The engine dimensions are 4¼-inch bore by 6-inch stroke. A cone clutch is used. Crankshaft has three bearings of the following dimensions: Diameter, 2½ inches; lengths, front bearing, 3¾ inches; middle bearing, 3½ inches; rear bearing, 4¼ inches. Pressure oil feed with splash is used. There are three oil pumps to take care of the tilting of the tractor. Magneto is used for ignition with impulse starter. Governor and fan are gear driven. The governed speed is 900 revolutions per minute. Make of carburetor is undecided. Gasoline is fed by gravity from a tank of 26-gallon capacity. The cooling system contains nine gallons of water.



The drive is taken from the clutchshaft to a transverse shaft by bevel gear. A pulley is placed on one extremity of the transverse shaft and a cable hoist between the frame and the transmission case is on the same shaft. Reduction gearing, through shafts, back of the transverse shaft.

The tractor has three speeds on either drive or pulley gear reductions. A speed of six miles per hour is attained on high at 900 r.p.m. The intermediate or plowing speed is 2¼ miles per hour at 900 r.p.m.; low speed, 1¼ miles per hour at 900 r.p.m. Transmission bearings are all anti-friction type with narrow center-to-center distances, not exceeding 14 inches at any point. The frame is the accepted tractor construction, of pressed steel, having a depth of seven inches. Oil tubes of the engine can be taken out and cleaned. This is an example of the accessibility of the entire tractor.

The Maxwell tractor has been thoroughly tested and some of the tests were made on sugar and rice plantations in Louisiana under the supervision of P. R. Janney, the Maxwell field engineer. The price of the new vehicle has not been fixed, but the figure will be low, it is said.

Car Price Increase Trend.

One way in which motor cars have been slow is in following the world-wide price-increase movement in nearly all lines during the last three years. This fact has been developed in a surprising way by a comparative analysis of price fluctuations of automobiles and leading commodities just made by the National Automobile Chamber of Commerce, as shown in the accompanying table. The average wholesale price of all the automobiles and motor trucks produced in the United States during the last six years shows a decrease each year ranging from 4.7 per cent. to 16.5 per cent. until last year, when there was an increase of 4 per cent. Prices of 13 principal commodities, as reported by Bradstreet's index, decreased slightly until 1915. In that year they increased 18 per cent.; in 1916 more than 28 per cent., and last year more than 30 per cent. English commodity prices have increased 87.5 per cent. since 1913.

Features of the New Maxwell Tractor: A, Pulling Corn Binders, a Difficult Task for Horses or Mules; B, Three-Quarter View Showing Municipal Tread and Hood Removed to Show Power Plant; C, Rear View and Showing How Gears Are Protected from Dust, Mud, Etc.

NEW AND INTERESTING THINGS IN MOTORDOM

The Oro Formost Bumper.

The Au-To Compressor Co., Wilmington, O., manufacturers of the Oro line of automobile accessories and air compressors, has recently placed on the market a new bumper known as the Oro Formost, with a universal fitting.

The Oro Formost Bumper.

The bumper is adapted to all recent models of cars, having the mud apron and fenders extending all the way to the front tips of the chassis frame, width and curve of frame being taken care of with the special adjustment. The brackets are made of malleable iron, sturdy and well balanced. The springs are concealed in housing and are finished in baked black enamel. The bars are finished in black and nickel, specially rust-proof treated.

This bumper comes complete with drop forged hook bolts ready to attach, packed in individual cartons. Illustrated literature will be mailed to dealers upon request.

"Keep Your Car Young."

We wish to acknowledge receipt of an interesting 16-page booklet entitled "Keep Your Car Young," issued by S. C. Johnson & Son, well-known manufacturers of auto products. This is one of the most attractive booklets that we have seen. It gives full particulars in regard to the Johnson products and emphasizes their great convenience for the use of automobile dealers, repairmen, garage men or individual car owners. The line illustrated and described inciudes Johnson's Cleaner, Johnson's Prepared Wax,

A Useful and Attractive Booklet.

Johnson's Stop Squeak Oil, Johnson's Black-Lak, Johnson's Auto-Lak, Johnson's Carbon Remover and Johnson's Freeze-Proof. A large majority of dealers throughout the country have already secured this very extensively advertised line, and any dealers who do not carry the line should communicate direct with the manufacturers, who would be pleased to furnish prices and terms. As for the booklet, this will be mailed free and postpaid to any readers of our magazine who will write for it, addressing their inquiry as follows: S. C. Johnson & Son, Dept. AD, Racine, Wis.

Permatex Gasket Cement.

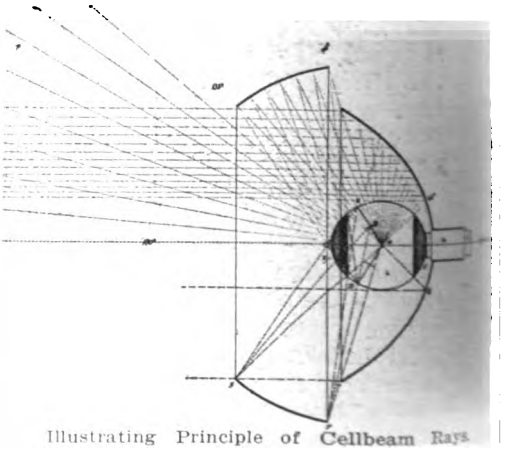
All repairmen appreciate the value of a good gasket cement. The Permatex heat resisting gasket cement is manufactured by Constant A. Benoit, Brooklyn, N. Y. This cement, the manufacturers state, will prevent leaks where leaks cause greatest losses. This product has been used for many years in the assembling departments of the leading manufacturers of automobiles, motorcycles, farm tractors, marine and aeroplane engines, and it is of equal value to the users of these machines when repair work has to be done. This cement has no harmful action on paper, cardboard, cork, leather, canvas, felt, rubber, asbestos or metal gaskets which are used on all types of gasoline, kerosene and oil engines. In fact, it prolongs the usefulness of these gaskets because of its resistance to gasoline, oil, water and heat. This cement is placed on the market in two-ounce bottles or cans containing ¼-pint, one pint, one quart or one gallon. The illustrations give an idea of the two-ounce bottles and the quart cans of this cement. For prices and full particulars readers should write direct to the manufacturer.

The Permatex Gasket Cement.

The Peteler Auto Jack.

We illustrate the new Peteler jack which has been placed on the market by the Coe-Stapley Mfg. Corp., 115 Broadway, New York City. Some of the good points of this jack are as follows:

Its stroke is very short, in fact, so short that the overhang of the car in any case cannot possibly interfere with the up and down movement of the handle. With this jack you do not have to crawl under the car or even get on your knees to place it in position. It has a long, telescoping handle, by means of which it can be slid to any point under the car. When not in use the handle is detached and occupies very little space in the tool box. The lifting action of this handle is extremely quick. It raises ⅜-inch with each stroke, which is considerably faster than ordinary jacks. Its easy operation is a very good point. The load may be lowered without touching the jack as a turn of the handle operates a small lever which reverses the action and the load

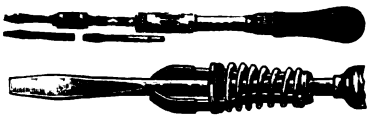


The New Peteler Auto Jack.

comes down quickly, step by step, just as it went up. The lifting bar cannot drop out, even when the jack is turned upside down, which means that no part of the jack can be separated and lost or mislaid. This jack is built of the very finest materials throughout. It is simple in construction, very durable and cannot get out of order. This jack retails for only $6.00, making it one of the quickest sellers for dealers. All who are interested should write for descriptive circular and prices direct to the manufacturers.

Right Side Up This Time.

The accompanying cut, showing the principles used in the construction of the Cellbeam concealed spot lamp was inserted by a regrettable error, in the December issue, upside down. It is now printed in its correct position. This lamp is manufactured by the Cellbeam Mfg. Co., 1101 Bedford ave., Brooklyn, N. Y. It is a compact light which has an exceptionally powerful projector of both spot and diffusive illumination. The concentrated beam of projected light extends 500 feet, while the objects close at hand



Illustrating Principle of Cellbeam Rays

are illuminated by a diffusive glow of indirect and transmitted light, devoid of the annoying direct filament glare. This lamp is a good seller and should be stocked by every live dealer.

"Yankee" Spiral Ratchet Screwdriver.

The incessant jarring, jolting and straining to which an automobile is subjected in its every part, constantly operates toward loosening of screws. Going over a car to tighten up screws brings the repairman or car owner up against locations where it is impossible to work

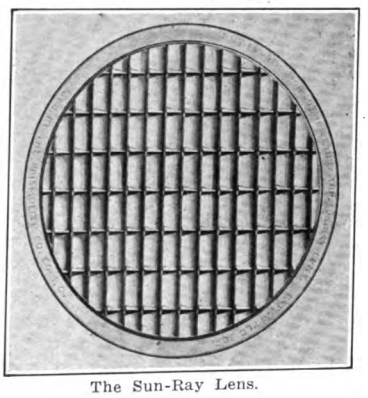
Showing Construction of "Yankee" Spiral Ratchet Screwdriver.

with an ordinary screwdriver. The advantage of the "Yankee" spiral ratchet screwdriver lies in the speed with which a screw-driving job is accomplished, under any and all conditions. A direct line push on the handle, and the screw is driven home, and much tighter than with the old handle-twisting type.

"Yankee" spiral ratchet screwdrivers are made in various sizes, from little No. 35, 7 inches long without bit, to big No. 31, 17½ inches long with bit. Among them is the "Yankee" quick return. This model has a spring in the handle which brings the latter back automatically, maintaining a sufficient pressure to hold the bit securely in the groove for the next push.

The ratchet shifter, easily changed at a finger-touch while tool is in place, produces right or left-hand movement of bit for driving or drawing; or with shifter in the middle, the driver instantly becomes rigid.

For setting screws in cramped places or at long reach, where only one hand can be used, the "Yankee" screw-holder attachment is available. This grips the screw while it is being started. Hold is



lustrating Use of "Yankee" Spiral Ratchet Screwdriver.

ıtomatically released as the screw-head nks into place.

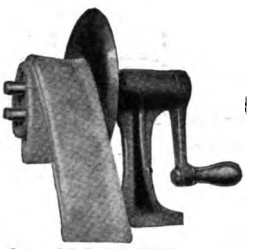
But that isn't all: The "Yankee" spiral ıtchet screwdriver makes an excellent push drill. It is provided with a chuck to take various size bits. Bit is revolved rapidly with each push. With a "Yankee" you can drill holes in places absolutely inaccessible with a brace, breast or hand drill. Undoubtedly one of the handiest time-saving tools a repair shop, garage, mechanic, or automobile owner can have. Made by the North Bros. Mfg. Co., Philadelphia, Pa.

The Sun Ray Lens.

Dr. C. W. Waggoner, illuminating engineer of the University of Virginia, spent more than a year working out the principle and construction details of the new Sun-Ray lens introduced at the New York automobile show by the Prismolite Co., Columbus, O. Dr. Waggoner was seeking a lens that would at all times and under all conditions meet the requirements of all the states and at the same time give the maximum of road

The Sun-Ray Lens.

illumination. He observed that the lens which concentrates the light on the road ahead frequently throws the beam into the eyes of approaching motorists because of the uneven surface of the road. Moreover, he pointed out that the concentrated beam did not give any light at the side of the road, making it extremely dangerous to drive at night. On the other hand he argued that the lens designed to avoid the direct beam by diffusing the light rays over 360 degrees of a circle is not economical because the light thrown skyward is wasted.



With these two objections in mind, Dr. Waggoner set about to find a lens that would illuminate the road in front and throw sufficient light to the side of the road to make safe driving without wasting light in the air above.

The Sun-Ray lens is the result. After a year of careful calculations, Dr. Waggoner succeeded in refracting the rays downward by a series of horizontal prisms so that double the amount of light is thrown on the road ahead.

By a second series of vertical prisms, he also threw the light on the sides of the road. These vertical prisms break up the concentrated beams, eliminating all glare. Thus, the lens gives all the advantages of total diffusion with none of its disadvantages, and also gives all the advantages of deflection without its faults. The Sun-Ray lens is said to meet the requirements of every state in the Union, and has been officially approved by several of them, including New Jersey.

A Tube Deflator.

The Williams Foundry and Machine Co., Akron, O., is marketing the improved tube deflator illustrated herewith, for repair shop use. With it the tube is slipped over one of the projections on

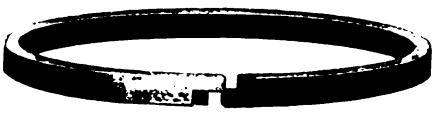
Tube Deflator Made by Williams Foundry & Machine Co., Akron, O.

the plate; then by turning the handle the tube is wound tightly around the two projections and the air exhausted in a jiffy. It is a handy size and will deflate any size tube.

A New Auto Lamp.

We take pleasure in describing a new automobile lamp which will be put on the market this coming season. It is not an electrical lamp. It has stood the test of years in actual use. The energy for the lamp is derived from magnetism, not electricity. The radium or light is produced by a gas and not a filament.

By its great convenience this lamp is bound to create a large demand. These lamps will not be sold, but will be rented on a deposit from the car owner, sufficient to cover their manufacture, and it is expected that these lamps will be leased at a nominal charge of $2.00 per lamp per year. Two head lights or side lights would cost $4.00 and one tail light $1.00, making a total charge of the ac-



A New Motor Vehicle Lamp.

tual necessary lamps on a car $5.00. The makers maintain all renewals and repairs at their expense. This lamp will be manufactured by the Carbo-Gas Co., Gardner building, Kansas City, Mo.

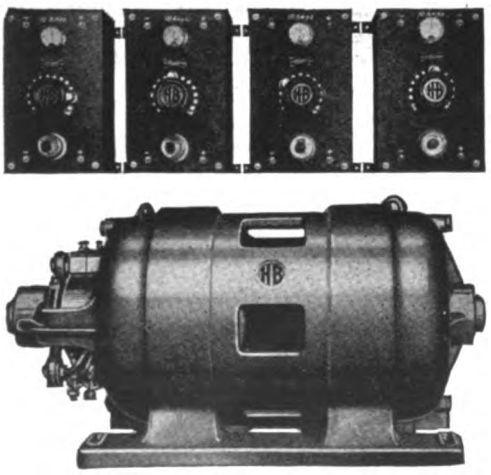
The Taylor Leakage-Proof Ring.

The Taylor Leakage-Proof ring is made for the Ford and 500 other makes and models of engines. These rings sell for 50 cents each in standard and oversizes. The Taylor is a strong, absolutely round, one-piece ring carefully machined

The Taylor Leakage-Proof Ring.



and ground to size. It is an eccentric ring with a joint which is absolutely leakage proof, compression tight and which is designed to compensate for wear and yet be gas-tight and oil-tight when the joint is open ⅛-inch. Manufacturers claim that this ring will stop loss of compression, oil throwing and carbon troubles. Also that more miles per gallon of gasoline and oil will be obtained. The danger of an accumulation of carbon, it is claimed, is largely obviated by the use of this ring. Readers who are interested should write direct to the manufacturers, G. H. Dyer Co., 155 Brookline street, Cambridge, Mass.

A New Charging Outfit.

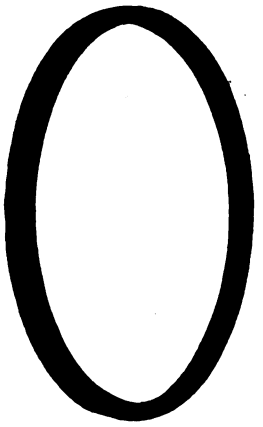
For the garage man going into battery or service work on an ample scale, or for the garage that has outgrown its present equipment, Hobart Bros. Co., Troy, O., have brought out a new 32 battery capacity charging outfit shown herewith.

With the HB outfit batteries in all stages of charge can be handled by the four charging lines of this equipment, caring for eight batteries in each line. Batteries requiring different charging rates can be handled according to their individual needs, due to the ample output of the machine. Different voltage batteries can also be charged in the same line, due to the automatic voltage control of the generator.

With this ample capacity outfit, battery charging work is claimed to be very profitable, and the makers state they have designed the outfit wholly with the

38 Battery Charging Outfit Made by Hobart Bros. Co., Troy, O.

idea of bringing the garage the largest profits possible from battery charging.



The outfit is sold on a payment plan, that should enable the equipment to pay for itself while being used. The selling plan calls for a reasonable initial payment and the balance to be paid in 10 monthly payments. Write the makers for full particulars.

A New Piston Ring.

The Albany Hdwe. Spec. Mfg. Co., Albany, Wis., have after years of study and experience with piston rings of various types, developed a ring held to be entirely new and radically different from anything of the kind yet produced.

The ring is a combination of two real eccentric rings, the kind most universally used, and fitted together sideways in concentric form by cutting each ring down to half its width or thickness, but leaving a part of each ring full width, which is in the form of a crescent shaped flange running nearly half way round and forming the inner surface on the thick side of each ring.

When the two rings, which are exact duplicates, are placed together the openings come diametrically opposite, the outer walls of the flanges lie against the inner surface of the thinner tapering end portions of each engaging ring section,

New Piston Ring Made by Albany Specialty Mfg. Co.

and thus seals the opening of each ring perfectly and completely at all times regardless of the amount of opening between the two ends, due to wear or when used in old cylinders worn large. The combined sections exert equal if not greater pressure on the cylinder wall than the single solid eccentric ring.

The makers claim that this type of construction completely eliminates the prevailing weak points in other forms of two or three-piece concentric ring construction, namely:

First, there are no pins to wear out, or break or weaken the ring. Second, no breakage from installing or removing so common with two and three-piece rings and easier to install than any common single piece ring. Third, no dragging of one section upon the other as with other multiple rings, thus leaving each section as free and quick of action as a single piece ring, so necessary in high speed motors, or in old worn cylinders. Fourth, no open ports to permit gas or carbon to get under the ring. Fifth, no unequal wear on the cylinder walls as with multiple rings of concentric type sections, or solid concentric rings, even when expanded to fit worn or rebored cylinders. Sixth, no short lap milled joints whose rough contact surfaces can never be made gas tight. The long lapped joints of this ring are practically as smooth and close fitting as a ground joint. There are many other good claims to be mentioned, and the makers declare the claims are all open to any criticism.

Krom-Nik Gears for Ford Cars.

Dealers could earn good profits by acting as agents for the Krom-Nik gears, which the manufacturers state will easily add 20 per cent. more power to the Ford car. The Krom-Nik-Anderson 4.2 to 1 ratio gear has a special type of tooth, unlike any other, which gives it additional strength and efficiency when needed. The 4.2 to 1 ratio of this gear is the lowest gear reduction possible in a Ford axle. The manufacturers claim that this device will save any Ford driver many dollars in repairs and loss of time and accomplish work impossible with the standard gear. For prices and particulars readers are referred to the attractive full-page advertisement published in this issue by the Krom-Nik Gear Co., Chicago, Ill. This advertisement contains a special offer to dealers, and no doubt a great many of our readers will be glad to fill out the coupon and send it in so as to take advantage of this very liberal offer, which gives an opportunity to try this gear on very favorable terms with a guarantee of workmanship and material for one year.

To Stop Ford Thieves.

The Security auto lock is being put on the market by the Security Auto Lock Co., New York, which company is owned by White Bros., 187th street and Grand Concourse, Borough of Bronx, and they are now appointing borough, city and county distributors.

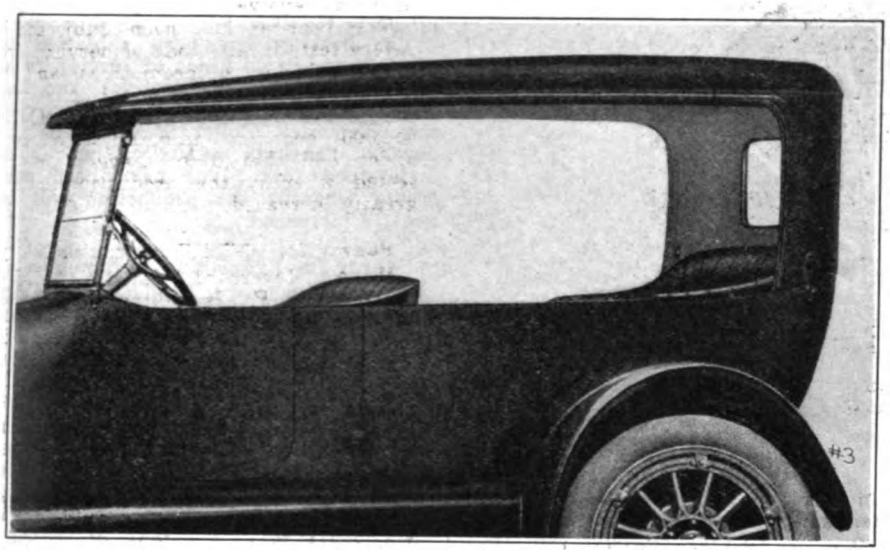
The Ford Relief Spring Co., 7 East 42nd street, are the distributors for New York City, while Morris & Smith, 1995 Bedford avenue, are the distributors for the Borough of Brooklyn.

The Security auto lock is an innovation in the way of safety devices to protect a Ford and make it thief-proof. The lock is simplicity itself. The lock is a permanent part of the Ford, being placed directly under the steering wheel, applied by a special tool, and when locked cannot be removed even though you have the tool.

The principle of the lock is that it disengages the wheel from the steering post when the key is removed from the lock. In order to operate the car it is necessary to leave the key in the lock. When the key is removed the steering wheel is disengaged from the steering post and free to spin around like a top, and the front wheels of the car are wild. It is impossible to tow the car away.

The lock sells at the nominal price of $5.00, easily within the reach of every Ford owner, and is an insignificant amount to have your mind set at ease that your car is not being taken from the street or garage. The Yale tumbler, in conjunction with the lock, is an article of well-known quality.

The Vacuum Muffler.



The manufacturers of the Vacuum muffler state that an engine develops more power and uses less fuel with the attachment than with a free exhaust. In this muffler the violent force of the charge is deflected against a series of cone, and split up into numerous small discharges, each of which is separated and evenly expanded to atmospheric pressure. These small discharges are delivered to the atmosphere one by one with scarcely any perceptible noise. It is claimed that no carbon gathers in the muffler and its construction does away with muffler explosions. It is rust-

Digitized by Google

teed against blowouts. Readers who are interested should write for prices and particulars direct to the manufacturer, the Vacuum Muffler Corp., 154 Nassau street, New York City.

Rex All-Season Tops.

An innovation in tops in that it combines all of the advantages of a winter

For Summer Driving, All Panels of the Rex Sedan Are Removed and Stored Away. Note the Unobstructed View Afforded Passengers.

enclosure with the conveniences of the summer or touring car is the Rex all-season top, which is made by the Rex Mfg. Co., Connersville, Ind., and comes in sedan, coupe and roadster types for all makes of standard cars. A feature of the construction is that the side sections are removable and can be stored away when not in use, eliminating excess weight.

During the winter season the Rex-equipped car is entirely enclosed with all side panels snugly in position. Door windows have upper glass panels which may be lowered by the seated passengers; non-rattle fasteners hold these upper panes and simply turning screw heads causes these to free the glass and allow it to slide down in velvet-covered channels and rest on rubber bumpers, which also support the bottom glass. Practically any desired kind of ventilation can be obtained by opening the door-windows in combination with the windshield. The tonneau is illuminated by means of a rosette dome light.

In spring or fall all the sides may be removed, or the rear window panels may be left in place for back seat protection. As a summer car the Rex-topped automobile has sides unobstructed from windshield to the broad back window, giving a fine free effect of clean lines and complete ventilation.

The Rex top is specially designed and built for each different make of car on which it appears—to harmonize with the body lines and preserve the individuality of every model. Otherwise, the actual construction of the top, its mechanical features and general appointments are largely standard.

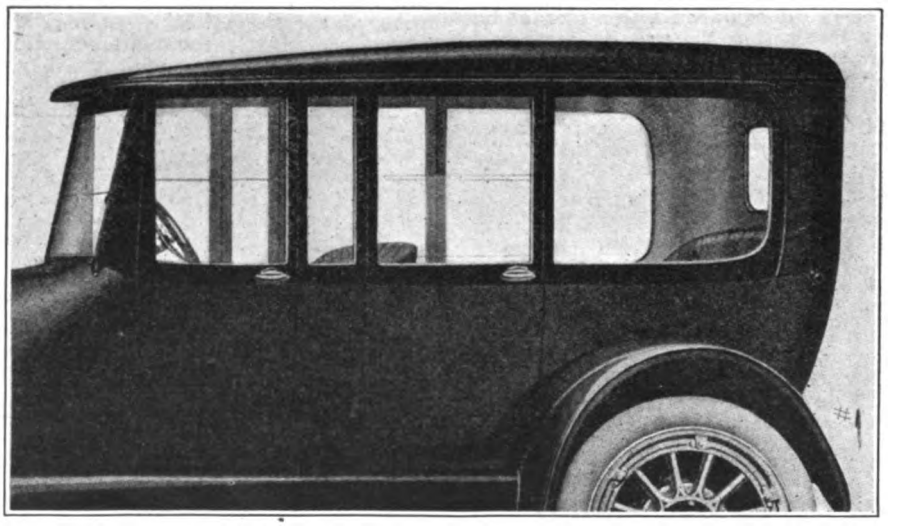
The Rex top is built of hard wood, is mitred and mortised, glued and screwed together and substantially ironed and braced. The deck is constructed of transverse bows which are covered with light wood strips. The back and rear section of the roof are reinforced with sheet steel.

The hard wood panel frames receive a rich satin finish as the result of many operations, including painting, varnishing and hand-rubbing. Door windows are of polished plate glass—stationary windows of crystal sheet glass—or furnished according to the specifications of buyer. Interior linings are made to match leather upholstery, gray cloth, or as specified. These are edged with braid or lace.

An Interview With F. C. Milhoff.

"Why should the motorist have his buying pervaded with the gambling element any more than any other type of buyer? Certain well-known brands of shoes, for instance, are known to give a definite service. Not one pair out of a hundred, possibly, falls short of expectations. We buy certain types of cars with the knowledge that a given mileage may be expected of them. Why potshot luck with tires? If you are fortunate you may get a tire that runs 5,000 miles. The next may close its career with a paltry thousand to its credit."

This was the vein in which Frank C. Milhoff, general sales manager of the Miller Rubber Co., Akron O., was discussing the tire situation of today. He justified the motorist in expecting tires of the same kind, subjected to like conditions, to render approximately the same mileage. He said that just such tires as these was Miller announcing in its big, powerful, national campaign. He said:



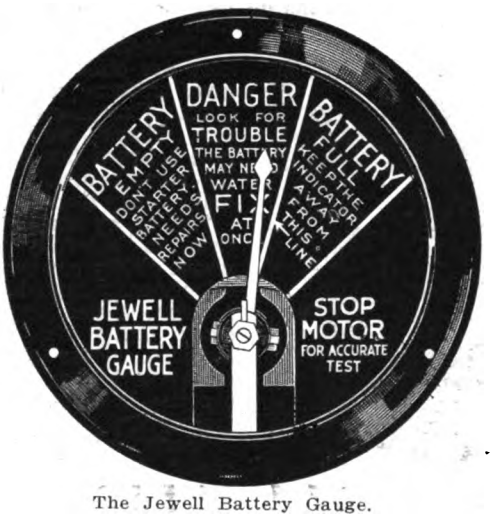
"Tires that are built uniformly, and as they are built in the Miller factory, do give uniform mileage—and the maximum. Exceptions may be found in any line. They're the lucky tires. They may give between five and 10,000 miles. But the manufacturer's problem has been to make every tire as good as his best.

"Miller, by confining the building of its tires to carefully recruited men, men whose ability has been proven by records scientifically kept, has at last solved the problem of making uniform tires. Now every Miller tire is made by master builders, whose average personal efficiency is 96 per cent. Not more than one tire in a hundred ever calls for adjustment.

"Such tires," the "Miller Man" concluded, "are indeed down to the instant tires. They are tiredom's finest example of conservation."

Hudson Motor Specialties.

An unusually useful and attractive line of automobile specialties is made by the Hudson Motor Specialties Co., 1606 Real Estate Trust building, Philadelphia, Pa. This line includes the Hudson universal jointed valve grinder, which is especially useful in grinding the valves on the fourth cylinder of the Ford engine, which is very difficult to reach with the ordinary grinder. Another Hudson specialty is the Hudson crankcase repair arm for Ford cars, which is a great time and money saver in making crankcase repairs. The Hudson automatic manifold air adjuster, made by the same company, automatically adjusts the air supply through the manifold, at all speeds from idling to highest engine speed. The Hudson demountable hub enables the car owner to change four demountable hub wheels while one demountable rim is being changed. The Hudson specialties were exhibited at the New York and Chicago shows and they will also be shown at the Boston show at the booth of the Motor Car Equipment Co.



The Rex Equipped Sedan Completely Enclosed for Winter Driving.

Jewell Battery Gauge.

Among the many automobile conveniences offered there is none so near an actual necessity as is the Jewell Battery Gauge, made by the Jewell Electrical Instrument Co., of Chicago, Ill.

The purpose of this instrument is to keep the car user constantly informed of the condition of the storage battery. This it does, not in a technical statement of volts and amperes, but in plain English that quickly warns the car user of any approach of trouble from any cause.

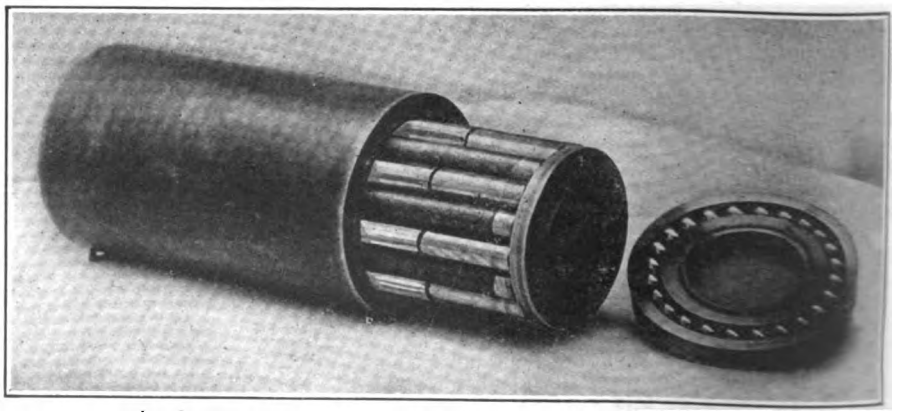
The Jewell Battery Gauge.

It also notes any discrepancy in the charging current. Indicates the existence of a short circuit, or insufficient water in the battery.

The instrument is made either flush or extension type, and can be located at any convenient point on the car, either on the instrument board or elsewhere. The wiring necessitates only connecting the two terminals on the instrument to the two poles of the battery. The current passing through the instrument is so slight (less than one-hundredth ampere) that the storage battery standing idle will discharge through the atmosphere faster than it could through the Jewell battery gauge. That this gauge is needed is clearly indicated by the warnings posted in every car equipped with a storage battery instructing the user to inspect the battery at least twice a month. The Jewell battery gauge gives this information constantly without the trouble of hydrometer tests and with far greater accuracy than is possible with such tests.

Electric Soldering Iron.

If any of our readers have had unsatisfactory experiences with an electric soldering iron, it can be confidently predicted that it was not made by the Dover Mfg. Co., Dover, O., New York office, 30 Church street. The Dover electric soldering irons are thoroughly practical and entirely reliable. See their announcement on another page and write for descriptive circular.



Important Correction.

In the January issue, also in a few copies of the December number, a very regrettable error was made in the advertisement of Chas. E. Miller, Anderson, Ind. In this announcement the price of the new 1918 model "4 Cavity" Miller vulcanizer was given as $50.00, although the correct price is $150.00. Of course Mr. Miller has been considerably annoyed by the replies to this advertisement and naturally he could not afford to sell this excellent vulcanizer for one-third of the regular price. This is one of the best tire vulcanizers for tire repair shops ever placed on the market, and it is only one of the 53 kinds and styles made by this manufacturer. Readers who are interested should write for price list and full particulars, also new 80-page catalog, to Chas. E. Miller, Anderson, Indiana, Dept. H.

Planetary Rubber Bearings.

A new type of bearing, one consisting of rollers operating without lubricant, and a construction that is claimed eliminates friction, is being marketed by the Planetary Roller Bearing Co., 53 West Jackson blvd., Chicago, Ill.

This roller bearing in its construction involves simplest mechanical principles. It consists of a number of plain bearing rolls, divided and fitted end to end, which revolve within a casing or box and bearing upon a shaft, spindle or axle. These rolls are alternated with an equal number of idlers, floating or separating rolls of a slightly less diameter at ends, and reduced to a still less diameter between each end, affording space for free circulation of air through the bearing, also reducing friction to the minimum, eliminating sliding contact with shaft and boxing, and making the bearing practically dust-proof.

The Planetary Roller Bearing Operating Without Lubricant and Held to Be Free from Friction.

The bearing works equally well at any rate of speed or under any load necessary. The load rests upon a small proportion of the rollers, which are constantly turning when in operation, rotating forward with the direction of travel of the wheel or shaft, the intermediate idlers, or separating rolls, revolving in an opposite direction without contact with shaft or axle, and lightly rolling upon the inner surface of the box. It will be understood from this that there is merely a contact at points upon which all parts revolve.

The bearing has been subjected to severe tests in all kinds of service, from motor vehicles to locomotives, and has proven efficient. The annual capacity of the Planetary Roller Bearing Co. is 500,000 bearings annually, but it is understood that plans have been perfected whereby the production will be greatly increased.

Panvar for Refinishing Automobiles.

H. A. Meyercord, Bulletin building, Philadelphia, Pa., is making a great campaign in the interest of Panvar, which is a wonderful refinishing flow-on material that anyone can apply to an automobile with assurance of complete success. Panvar is similar to the high gloss finishing varnish which body builders use as a final coat to give the car its luster. Unlike varnish, however, Panvar can, it is claimed, be applied by any amateur with assurance of complete success, as it is quick flowing, self-leveling and no experience is required. Panvar will not discolor from water or steam and is not affected by weather changes. It will not crack, craze or peel, and resists heat, acid and rust. It can be applied with a brush, spray or cloth and dries with a hard glossy finish in from six to eight hours. Panvar is a great seller and many dealers who read this will be interested. Mr. Meyercord is also pushing a carbon remover called Auto Power, which will be described later.

Carborundum Valve Grinding Compound.

This is a mixture of carborundum which is the hardest, sharpest and fastest cutting material known, and a high-grade grease. The manufacturers state that this compound is clean and free-cutting and that it quickly and easily cuts away the carbon and pit marks. It grinds with absolute uniformity, leaving a true, clean and unscored valve seat. This compound is put up in one and five-pound tins, coarse, medium and fine. A sample can will be sent on request if you write to the manufacturers, the Carborundum Co., Niagara Falls, N. Y.

The Minute Wheel.

This picture shows "The Minute Man" in the act of removing a "Minute Wheel."

"One nut to unscrew"
That's all you do."

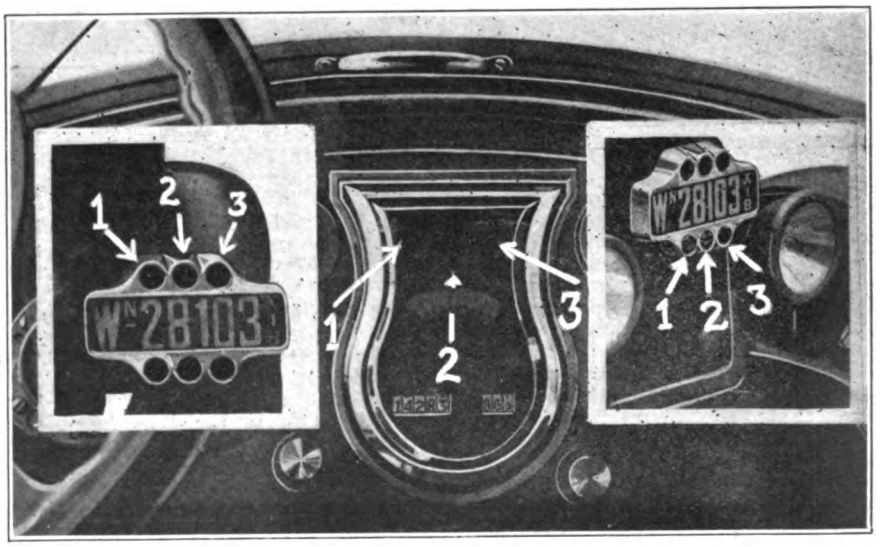
Does it sound too good to be true? However, with Minute Wheel equipment, the tires can be shifted very quickly. Only one tool is used—a large wrench.

Demountable rims drove out the old clincher rims. Now comes something better. By removing one nut, a spare wheel can be brought into action instantly. A tire can be changed in a minute—hence the name—Minute Wheel.

"The Minute Man" Removing the "Minute Wheel."

Instead of pounding, tugging and getting covered with dirt, Minute Wheels can be shifted by a boy or girl in a few seconds—no bother, no ruffled temper, no vexatious delay.

The new wheel is made by the Hill-Smith Metal Goods Co., Boston, Mass., to whom all inquiries should be addressed.



Benson Automatic Speedometer Signal.

A novel application of the block signal so successful in railway service is noted in the device being marketed by the Motors Appliance Co., East Moline, Ill. It is known as the Benson signal speedometer and permanent license number and has a number of useful features.

Not only is it a traffic signal, but it incorporates a speedometer, a bumper, and a transparent license number, above and below which are two series of eyes which indicate the speed at which the car is traveling at all times. Since there is nothing intricate to the signal, all the wiring being within a cable, installation is simple. A housing of sufficient size to accommodate a license number with enough margin above and below for the colored bull's-eyes is made for both the front and rear of the car. The speed-indicating part of the device attaches to the dash the same as any speedometer. The lower end of the arrow, which indicates the speed, travels across electric fields as the speed increases and lights the bulbs back of the bull's-eyes. Thus, when the speed reaches five miles per hour the light in the upper left burns and when the speed increases to 10 miles per hour the one beneath burns also. The same action takes place for varying speeds up to six lights, the last light coming on when the speed gets up to 40 or 50 miles per hour, according to the setting. Lights can be arranged to cover a wide range of speeds to conform with statutory limits.

Another feature which is in the interest of the car operator is an attachment to the bumper which, when pressure is put upon the bumper, closes an electric circuit and locks the pointer of the speedometer as well as the lights indicating the speed at which the car was traveling when the impact came. Only the traffic officer's master key can open the speedometer and release the pointer. Thus, when an accident occurs the operator of the car is protected if he is innocent and exposed if he is guilty of excessive speed.

The permanent license plate feature is designed to bring about a reduction in the theft of cars. Not only would it save the State a large amount of monev in the annual making of license plates, but if all cars once were given a permanent number, then none but new cars would have to be licensed and no one could get a number for a car that once had been registered without proving ownership.

Showing the Benson Signal Attached to Rear of Car at Left and In Front at Right. Center Illustration Shows the Device.

Important Consolidation.

There has been a consolidation of the Moline Automobile Co., makers of the Moline-Knight cars, and the Root & Van Dervoort Engineering Co. into Root & Van Dervoort Engineering Co., East Moline, Ill. The officers and management remains the same and there is no change whatever other than in the name of the company. In the past these two companies have always been virtually synonymous, operating, however, under the two firm names under the control of the same general officers.

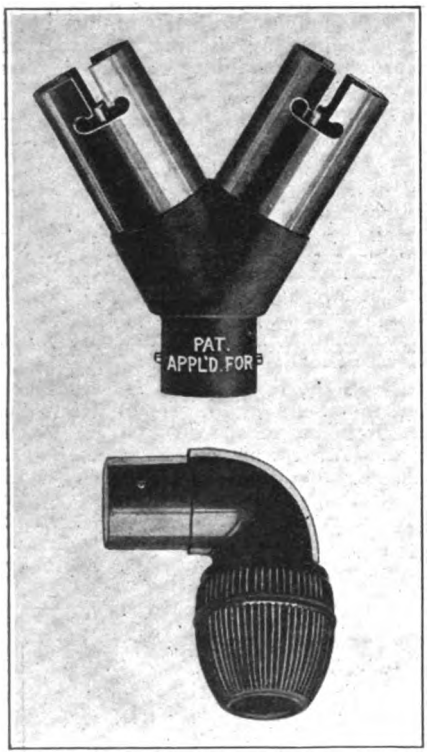
The Root & Van Dervoort Engineering Co. was established in 1898, and since then has been extensively engaged in producing high-grade gasoline and kerosene engines known as "R. & V." engines.

The officials of the Root & Van Dervoort Engineering Co., realizing in 1904 that there was a big future for the automobile, took advantage of their extensive gasoline engine experience and founded the Moline Automobile Co. that same year. The product of this company was known as the Moline and later as the Dreadnought Moline, winning fame for the makers by winning a number of the prominent reliability contests in this country.

In 1913 the Moline Automobile Company adopted the Knight Sleeve valve motor as the power plant for their passenger cars, using the trade name "Moline-Knight." This car sprang quickly into prominence as the result of a public test under the auspices of the Automobile Club of America at New York in December, 1913. World records for power, endurance and economy were made during this 337 hour non-stop run under full load.

In 1916 the Root & Van Dervoort Engineering Company branched out into the manufacturing of special munition lathes and also filled a large contract on 8 inch high explosive shells for the British Government. When the United States entered the war, Mr. W. H. Van Dervoort, President and General Manager of Root & Van Dervoort Engineering Company, immediately offered to turn his entire plant over to the Government. This offer was accepted in part so today the huge factory is turning out large quan-

Digitized by Google



tities of necessary war material for the Government.

For the season of 1918 Root & Van Dervoort Engineering Company in addition to building Moline-Knight automobiles will have a big production of stationary engines, tractor and automobile motors, besides filling large United States Government contracts.

The Moline-Knight automobiles will be built in two chassis, one 40-H.P. and the other 50-H.P. known as the Models "C" and "G" respectively, with prices running from $1,650 to $2,280.

A Unique Accessory for All Cars.

The Metal Specialties Mfg. Co., Chicago, Ill., have again surprised the accessory trade by placing on the market the new and unique article illustrated herewith known as the 3P Double Outlet Y plug socket for automobile dashboards. This article has already demonstrated its usefulness and merits to many automobile owners. Unlike the straight plug socket, the little member of the well-

The 3P Double Outlet Socket.

known Presto accessory family is made in a Y shape. This shape converts a single outlet into a double outlet. By using this Y plug socket the owner uses his single dash lamp socket for two purposes at the same time; for example, one side of the plug may be used for spotlight and the other side either for an inspection lamp, regular dash lamp or cigar lighter.

The Presto Y plug has a standard Ediswan type plug connection on one end which can be plunged into any dash lamp socket on the dashboard of an automobile. The Y plug is neat and ornamental with the exposed parts handsomely nickel plated. It is made in the following styles: double contact, single contact, and double to single contact.

The factory of the Metal Specialties Mfg. Co. is located at 338-352 North Kedzie avenue, Chicago, and is the home of all the 101 useful Presto accessories.

A Large and Growing Wholesale House.

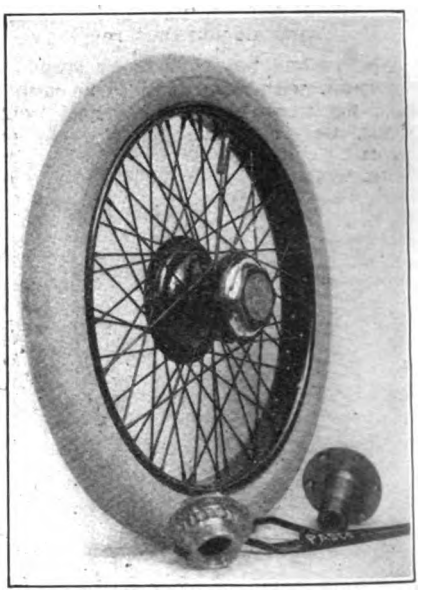
A. J. Picard & Co., Inc., who started business in a small way at 1720 Broadway, New York City, many years ago, and who have grown to be one of the largest automobile accessory jobbing and distributing houses in the United States, announce the discontinuance of their retail store at 1700 Broadway. Their business in future will be exclusively wholesale, and will be handled in their new building, Sixty-first street and Broadway. A. J. Picard, head of the company, has been identified with the automobile industry for 20 years and is the dean of the dealers. He at one time was the representative for the Darracq, when the motor car was looked upon as a curiosity, and drove one of the first road races ever held in this country. He has remained in the business continually and has seen it grow to be the second largest industry in America.

Picard & Co. cover all of the Eastern part of the United States with a sales force of 24 men, handling the entire line of motor car accessories, serving several thousand dealers. They are also Eastern distributors for the Stromberg carburetor, Gabriel snubber, Apollo Rubber Co., besides being national distributors of the Genemotor starting and lighting system for Ford cars, manufactured by the General Electric Co.

Worm Drive Axle.

The Standard Worm Drive Axle Co., 1801-1809 Belmont avenue, Chicago, Ill., is placing on the market a worm drive axle in two types. Type A being suitable for Ford truck attachments converting the Ford into a 1½-ton truck, and type B being suitable for trucks of any type of 1 to 1¼ ton capacity. These axles are made of the best materials and up to the highest engineering standards. Any of our readers who may be interested should write for quotations direct to the manufacturers.

Pasco Wheel Good Investiment.



"Pasco" quick-change wire wheels prove of unusual appeal because of the three following distinct qualities claimed by the makers, the National Wire Wheel Works, Geneva, N. Y.:

First—The "Pasco" wire wheel has a patented method of rim punching and spoke lacing which makes it stronger than any other wire wheel and 60 per cent. stronger than wooden wheels. All spokes cross four others in both the front and rear rows, forming a strong double web in the spoke lacing of the wheel hub and rims. Previous methods only allowed two or three crossed spokes.

Second—The "Pasco" hub cap is made of a strong indestructible metal that stands up in crowded traffic collisions, where aluminum, brass, and other soft metal compositions will strain or break.

Third—The "Pasco" patented safe-locking hub cap positively locks itself and wheel on to the threads of inner fixed hub and axle and will never work loose or allow wheel to come off moving car under any circumstances. To remove the cap a safety lock must first be released, and then a wrench used.

"Pasco" wire wheels may be considered an investment. Due to their heat radiation, their lightness at the rim, and their resiliency, they are a great saver of tires and gasoline. They are designed for beauty as well as durability, and on account of the large beautiful hub used, they add a great deal to the appearance of the Ford car. The wheels are interchangeable on all hubs of the car, and the hub caps all have right-hand threads,

Pasco Quick-Change Wire Wheel.

making it very simple and easy to change a wheel.

A complete set is comprised of five 30 x 3½ plain clincher wheels, together with four inner hubs, four hub caps, dust cover for spare wheel and wrenches—everything needed for immediate installment on the car. Bearings are included with front inner hubs.

For details, etc., write Dept. K of the maker.

The Mayhew Curtain.

The Sutter-Mayhew Co., Detroit, Mich., is marketing the Mayhew adjustable curtain for motor vehicles, which presents a number of interesting as well as practical features. The device enables the driver to control the temperature of the engine by so adjusting the curtain that the amount of radiator surface ex-

The Mayhew Adjustable Curtain Regulating from the Seat the Amount of Radiator Surface Exposed to the Air.

posed to the air is regulated. The curtain is controlled from the seat, the actuating member being attached to the dash and out of sight. The curtain

Saves Ford Rear End

Rear end trouble! That's a big bugaboo with Ford owners. One of the chief contributing causes is inefficient transmission lining. It gets hard and polished —then grabs and slips—and *then* there's *trouble to pay*. The Ford comes to a stop amid heavy vibration and noisy chattering. The back end vigorously jumps up and down. The *direct shock* of this vibration is communicated through the drive shaft and gearing to the rear axle. No mechanism can stand such strain indefinitely. Rear end trouble is the *natural result*. Cork Insert Transmission Linings stop the grab and slip—eliminate the chatter and permit velvety smooth transmission action. They *save* the Ford rear end—prolong greatly the life and efficiency of the car. This alone would make the use of these linings economical and advisable. In addition they outwear two to three sets of ordinary linings.

A Non-Slip Fan Belt for Fords

Cork Insert Products Exhibited at New York and Chicago Shows

One Dollar for 1917 Fords
85c for preceding models

Authorities say that up to 50% of the "drive" goes to waste from slippage in the ordinary Ford fan belt. It gets so hard and glassy that the fan speed is reduced, the engine is not properly cooled and overheats. Cork Insert Fan Belts do not slip—they keep the fan fanning, keep the engine cool, are very long lived and economical.

proper is mounted on a neat bracket that is attached quickly and easily to the front of the car by means of two simple brackets. As may be noted by the accompanying illustration, the curtain when installed is hardly noticeable. This device is not for winter use alone, but can be employed on cool days. Details and prices of the Mayhew adjustable curtain will be supplied by the makers.

Noreca Grease Cups.

We wish to call the special attention of the trade to the Noreca grease cups manufactured by the Greist Mfg. Co. New Haven, Conn. The illustration shows the Noreca Gun-Kup, style A, showing plunger. It is a grease gun as well as a grease cup. When open it holds twice as much grease as closed. The act of closing it, which is a simple half turn, forces one cupful of grease at once into the bearing, leaving a cupful to be injected with the plunger as needed. The same company also manufactures several styles of plain cups. The Noreca, as illustrated, has several exclusive features, including a non-removable

Noreca Gun-Kup Grease Cup.

cap, half turn to open or close, cam action; no threads, positive lock, fills from the side, grease gun action in closing, multiple seal with expanding sleeve and opening for filling is in the most convenient position. Many of our readers are likely to be interested in this product and all such should write for prices and particulars direct to the manufacturers.

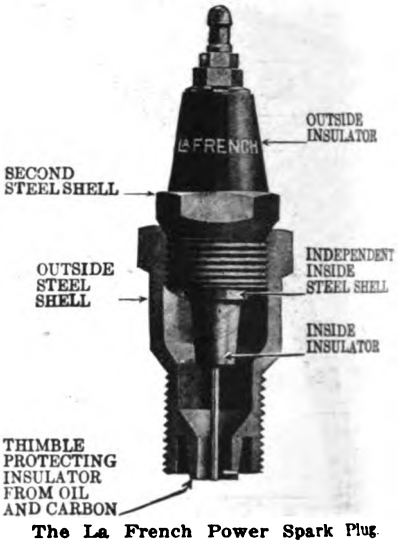
New Compound for Preventing and Removing Carbon.

A new preparation has been recently put on the market by Grace & Co., 3205 W. Washington street, Los Angeles, Cal. This compound, it is claimed, when mixed with the lubricating oil in an internal combustion engine will positively remove and prevent the further accumulation of carbon. It provides a harmless film on pistons, rings and cylinder walls, thereby increasing compression, and keeping the lubricating oil and fuel separate prolongs the usefulness of both.

Where this compound is used it is said to obviate the frequent cleaning of spark plugs, grinding valves, etc., as well as increase the power and mileage and save oil and fuel. This compound contains no acids, alkalis or chemical ingredients, and it is absolutely guaranteed to have no action on metals of any kind. The manufacturers are willing to send a sufficient amount of this compound to neutralize five gallons of lubricating oil for the small sum of $1.00 with simple directions for using, and they state that while this five gallons lasts there will be no trouble with carbon in the engine.

The Roof-Peugeot Cylinder Heads for Fords.

This is a cylinder head designed to increase the speed and pulling power of the Ford engine. Every Ford owner is a likely prospect for this specialty and dealers, garage men and repairmen throughout the country are selling a large number of these heads. The Roof-Peugeot cylinder head can be quickly and easily installed by any mechanic. It replaces the old cylinder head and has rocker arms, which are operated by the regular or Ford camshaft. Readers who are interested should write for prices and particulars direct to the Roof Auto Specialty Co., Union building, Anderson, Indiana.



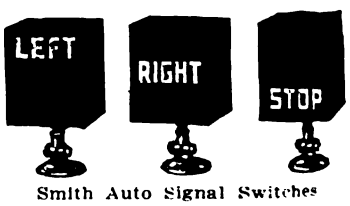
A Million Dollar Organization.

The Acme Motor Truck Co., Cadillac, Mich., formerly known as the Cadillac Auto Truck Co., manufacturers of the Acme truck, has increased its capital stock to $1,000,000. A very substantial dividend on the old capitalization was recently declared which is indicative of the company's growth in 1917. This company plans to double its production in 1918. Substantial additions to its present well designed plant are contemplated in the early spring. The affairs of the company are being conducted on a safe, sane basis. Every dollar of its capitalization has represented a dollar paid in. There has been no stock exploitation and no solicitation of stock sales. It is a home-owned organization and as the company has developed, each succeeding stock issue was quickly taken with local capital.

A program of building and expansion covering a period of five years has been mapped out by the officials of the organization. The Acme line consists of 1, 2, 3½ and 4-ton worm drive trucks. The company also specializes in body building in its own plants.

The LaFrench Spark Plug.

An accompanying illustration shows in detail the LaFrench power spark plug which has just been placed on the market. This plug is of unusual design and is built with telescopic tapered fittings which are assembled from the bottom up by hydraulic pressure, making the plug absolutely compression tight. The insulator is a mica composition, perfectly compressed and confined and which the manufacturers claim is not affected by heat, moisture or oil. It is stated that this plug produces the hottest spark ever produced by a plug; that it ignites the maximum amount of pocketed gas, thereby developing a remarkably increased power and mileage. The LaFrench has an independent inside steel shell which likens the plug to a dynamo and creates an electrical current that is transmitted with the least possible resistance. At the bottom of the plug there is a unique thimble arrangement which is devised to reduce to a minimum the accumulation of carbon within the plug. The complete plug is of two independent parts which can be taken down and cleaned in the most simple manner. On actual tests in engines of all kinds, LaFrench has proven a remarkable success even when used with very low test gasoline. After a motor boat test was made at Minneapolis



The La French Power Spark Plug.

recently, one of the engineers stated that he believed LaFrench will revolutionize ignition. Interested parties can secure additional information regarding this new accessory by writing the LaFrench Power Spark Plug Co., E. First avenue, Columbus, O.

Smith Auto Signal.

We illustrate herewith the new Auto Signal, which has recently been brought out by the Smith Signal Corp., 5355 West 66th street, New York City. This signal is not automatic, signalling electrically only when you want it to, giving definite information and warning when needed in ample time to guide both those in front and back of you. It operates from plainly marked, single handle, three-way switch, as shown in the illustration.

A front view of the car with the Smith Auto Signal installed is also

Smith Auto Signal Switches

Front View of Car Showing Smith Signal.

shown. This device provides cheap insurance known against accident and the fear of accidents. This is a quick seller and readers who are interested should write direct to the Smith Signal Corp. for prices and full particulars.

Now Travel in Safety

Your journey is safeguarded. There's comfort in the knowledge that delay and accident will not befall. As you choose the railroad which assures you greatest safety, so insure against serious trouble and delay when motoring by insisting on guaranteed Titanic Springs.

Three out of four automobile springs break in the center—because center bolt holes or center nibs weaken the spring at this vital point. Tuthill Titanic Springs have no center hole bolt or nib, and are guaranteed *forever* against center breakage. If you value safety and economy, replace with

TUTHILL TITANIC SPRINGS
LUBRICATED

More replacements are made with Tuthill Titanics than with any other makes of springs combined. There is a Titanic dealer within your easy call. Nowhere in the United States can a garage man or motorist be more than thirty minutes to three hours away from a stock of these better springs.

Strongest Where Others Are Weakest

Our new stock room maintains constantly the largest and most complete stock of automobile springs in the world. We carry in stock springs for all leading makes of cars and can supply in a very short time, springs on almost any car made.

Don't take a long chance on springs weakened by center bolt or nib holes. Replace with Tuthill Titanic Springs now—before that accident occurs.

DISTRIBUTORS AND DEALERS: Write at once for complete new price list. Tuthill Titanics mean quick money and the lasting confidence of your customers. Complete list of Distributors in Chiltons and Auto Trade Directory.

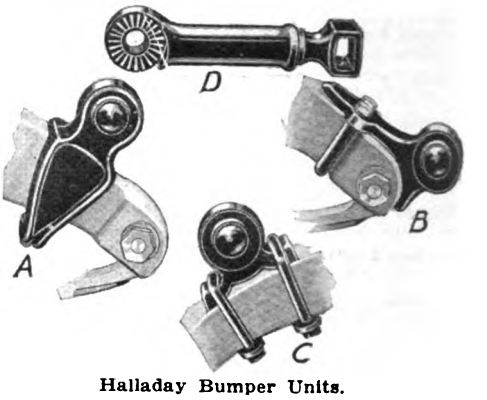
Tuxedo Tires.

The Tuxedo Auto Tire Exchange, 304-K West 54th street, New York City, has an announcement in this issue in which they state that big money can be earned by live dealers by handling their line of Tuxedo tires. These tires are guaranteed for 3,500 miles, but they are low in price. A complete stock of these tires is always carried in all sizes, plain and non-skid. Only one dealer in each town is allowed to handle this product and dealers who are interested should write for prices, discounts and full particulars.

Halladay Standardized Bumper Unit.

The small dealer has heretofore been confronted with a serious problem in the way of meeting the immediate requirements of his trade without carrying an extensive and consequently expensive stock. Numerous bumpers have been produced with an idea of universal adaptability, but with only limited success.



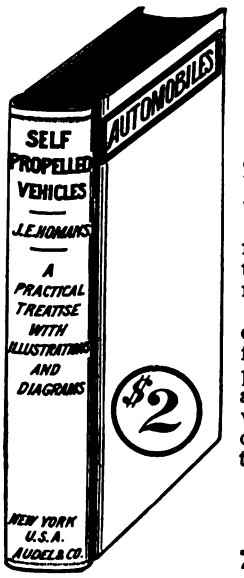
The Halladay standardized unit is not a single bumper built with an attempt to fit any kind of car, but consists of four fittings, three frame clamps, and a bar support. One of these clamps, fitting A, is designed for use on any frame the outside of which is exposed for a distance of four inches or more back of the spring connections, regardless of splash aprons on the outside.

The next fitting, B, is an under thrust support, and may be used on any frame on which there is room for a single clip, directly back of the spring connections.

The third fitting, C, is primarily designed as a rear fitting and works equally well on three-quarter elliptic springs and rear frame extensions. On rear frame extensions placed so close to the gasoline tank that no room is allowed for the clip part of fitting C, fitting A will often be found to work perfectly. The bar support, D, fits all these frame connections and, being pivoted, may be adjusted to any frame angle. This support fitting is furnished in both eight and 16-inch extensions for cars carrying one or two tires.

The small dealer provided with these four fittings, and a stock of Halladay bars, is in a position to meet the requirements of practically all cars provided with front frame extensions, and with a decided selling advantage from attempts at universal adaptability, that the bumper to his customer becomes one special design for that car.

The Halladay line also includes special



Halladay Bumper Units.

bumpers, designed for the front and rear of cars such as the Briscoe, Buick, Cadillac, Chevrolet, Cole, Dodge, Overland, Packard, Saxon, and others of such distinctive frame constructions as to require bars especially and exclusively therefor.

For prices and particulars write to L. P. Halladay Co., Chicago, Ill., or branches.

Auto. Educator.

EVERY OWNER, OPERATOR AND INTENDING PURCHASER SHOULD HAVE THIS WORK.

This book was written to meet the need for a simple but comprehensive treatise of motor car construction and care—a book that is not only a necessity to the motor car owner, but also useful to the skilled engineer and mechanic.

Being clear and concise in its treatment of the subject, and is comprehensible to the most inexperienced man. At the same time it is so thorough and detailed that the expert will learn much from its pages.

The treatise on gasoline cannot fail to prove valuable to any one interested in explosive motors, which are daily coming to the front as the readiest and most convenient source of power. ¶The price of this popular edition is $2.00, and as an insurance against accidents, caused by ignorance of the principles of operation—of which there are a lamentable number recorded every day—no one interested in the subject can afford to do without a copy of this timely volume.

Locks and protects coil units with hardened steel band. (Patent pending.)

A beautiful, polished, solid Aluminum case locks over switch. (Patent pending.)

DEFENDER LOCK For Fords $3.50

and costs no more than others

Operates against the ignition by special grounding device. (Patent pending.)

Guaranteed for the entire life of a car, and backed by a company fulfilling every sound business principle to the last ditch.

Recognized and used as a standard of perfection by Insurance Underwriters, and saves 15% on insurance.

The DEFENDER Lock is a double protection for FORD cars left at the curb, or in an unprotected garage. Its hold is secure. Yet it in no way changes the equipment, ignition or wiring of the car.

Locks the Ignition Off and the Coil Box Shut

It takes less than 10 minutes to install the DEFENDER Lock on any Ford car. There are no holes to drill or bolts to fasten, and when the lock is on no screws are exposed. It is indestructible, and cannot be broken with a hammer.

No automobile thief—regardless of how well he may know the mechanism of a Ford car—can tamper with this lock and beat it. It is the simplest, yet the strongest lock made. With it more than a million combinations are possible.

The DEFENDER key gives you easy access to the coil box for adjusting vibrators—but this access is obtainable in only one way, WITH THE DEFENDER KEY.

DEFENDER LOCK SELLS FAST

DEALERS know what lock sales are once they handle the DEFENDER. The price is right for Ford cars. The protection is complete. Ford owners demand DEFENDER. Thousands are ready for Spring sales.

Write for free illustrated literature and complete details.

No gap!

Gas cannot get through or past the Inland.

Expands in a perfect circle

against the cylinder wall, making a complete seal.

It seats quickly

because the elliptical ends are bent in.

The Inland is not only mechanically perfect, but its simple one-piece construction allows a low selling price, so that dealers can save car owners $5 to $10 per set over any other type of gas-tight piston ring. This exclusive combination of advantages featured in our full pages and half page ads in

The Saturday Evening Post
Literary Digest **Collier's**

is making the Inland the biggest seller everywhere—already 1,500,000 in use.

INLAND
1 PIECE PISTON RING

If you are not handling Inlands, you are not getting the big business that would come to you if you had the Inland sign on your store. *Get it there.* Write for our proposition today.

Inland Machine Works,
802 Mound St.,
St. Louis,
U.S.A.

Low priced

because of its simple one-piece construction.

Its Spiral Cut is patented—

its advantages cannot be duplicated in any other ring at *any* price.

Strongest and most durable

because equal width and thickness all around.

SHALER Roadlighters on Either Car Would Insure Safety

Prevents Accidents Like This

The danger of night driving is banished because *the other fellow's glare can't blind you* and your light cannot bother him, if your car is equipped with SHALER Roadlighters. You have intense light from fence to fence that enables you to pick the best part of the road and drive at daylight speed in perfect safety.

The SHALER Roadlighter throws concentrated beams on the edges of the road such as could only be obtained by using a spotlight on each side of the car. This beam is so strong that it counteracts the glare from approaching headlights and enables one to keep a clear view of the edges of the road while passing.

ROADLIGHTER

Pierces the Glare of Approaching Headlights
Illuminates the Ditches
Accurate Focusing Unnecessary
Easy to Keep Clean

Shoots the Light Far Ahead
Legal Everywhere
Rays Penetrate Fog and Dust
Easy to Install

Limited Offer to DEALERS ONLY

Regular retail prices of the SHALER Roadlighter are $2.75 per pair for Ford size and smaller; $3.50 for larger sizes. Packed ten in a carton.

We want every automobile accessory dealer in the United States to try out a pair of SHALER Roadlighters on his own car—*at our expense.*

Mail the coupon for full particulars regarding this big offer. There is no obligation—don't put it off—clip and mail coupon *now.*

9802 Fourth St.
Wisconsin

Dealers' Offer Coupon

DREADNAUGHT TIRES

NEVER in the history of this country has conservatism been so forcibly urged. In all walks of life the individual is seeking the utmost for the dollar expended. The DREADNAUGHT TIRE is a supreme example of the spirit of the times. Its very name proclaims its ruggedness, doggedness and its ability to withstand the hardest wear and tear.

GUARANTEED 5,000 MILES

but good for many hundreds more.

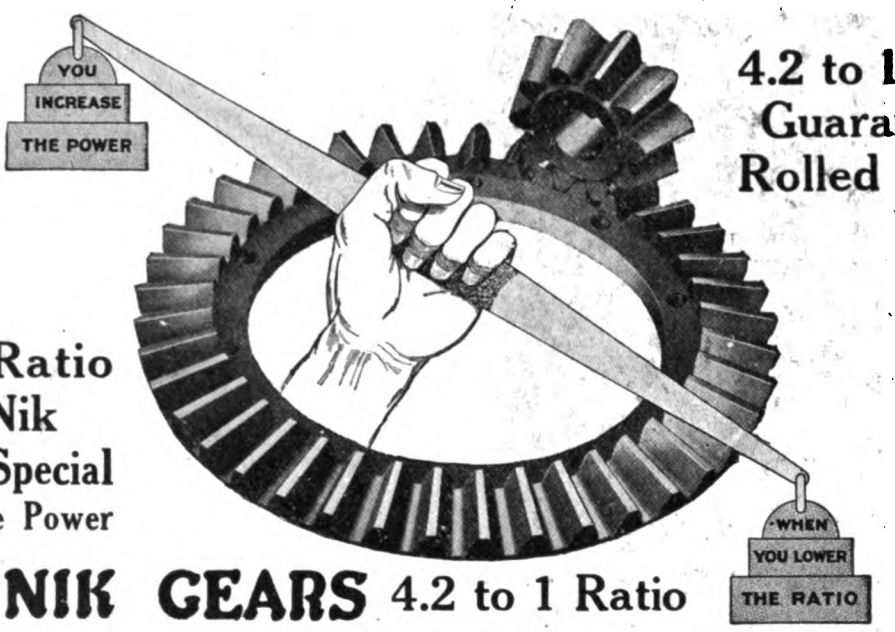
Made in two treads—the DREADNAUGHT VACUUM and the DREADNAUGHT RIBBED.

SUPER-DREADNAUGHT RED INNER TUBES are likewise the best buy on the market.

MANUFACTURED BY

The Dreadnaught Tire and Rubber Company

Baltimore, Maryland



We have an exceptional proposition for dealers and assure excellent service and territorial protection with intensive co-operation from our organization. Write or wire, Department "I."

EASILY 20% MORE POWER FOR FORD CARS

Price $12.00

4.2 to 1 Ratio Guaranteed Rolled Gears

4.2 to 1 Ratio Krom-Nik Anderson Special Gears Increase Power

KROM-NIK GEARS 4.2 to 1 Ratio

There are profits to be earned in your territory from the sale of Krom-Nik-Anderson 4.2 1 ratio special gears.

Every Ford owner is a prospect. The price is low—$12 retail, with liberal discount to dealers.

You can actually show the Ford owner how this device will add 20 per cent to his car's power. The Krom-Nik-Anderson 4.2 to 1 gear ratio is a special type of tooth—unlike any other—which gives it additional strength and efficiency when needed. The 4.2 to 1 ratio offered in the Krom-Nik is the lowest gear reduction possible in a Ford axle.

It will save any Ford driver many dollars in repairs and loss of time and accomplish work impossible with the standard gear.

It solves the rear axle problems for Ford trucks, increases the life of your heavy duty Ford two to five times.

Special Racing Gear 3 to 1 Ratio $12.00

M & S Locking Differential

This differential is standard equipment on some of the best known trucks in the country. It is used in Government trucks, Nash trucks, Republic trucks, and many others. Prevents skidding and spinning of wheels, keeps the truck going when the roads are slippery and muddy.

Further information will be sent on request. Send for Sample—Liberal discount to dealers. Price - - **$20.00**

KROM-NIK GEAR COMPANY, 910 Michigan Avenue, Chicago, Illinois

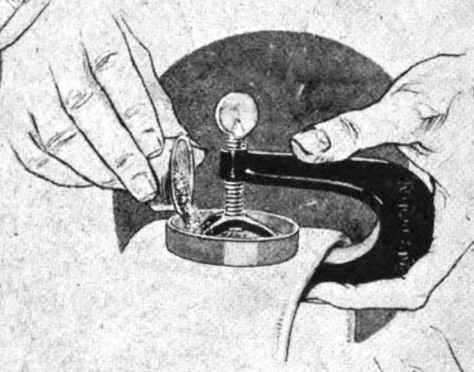
NEW—DRY FUEL ADAMSON

MODEL "E"



5-MINUTE VULCANIZER

For Tube Punctures

NO FLAME IT GLOWS

Fill the measure with Dry Fuel—

Empty it into the Vulcanizer—

Touch a match and the Dry Fuel burns with a hot glow—no flame. Gasoline can be used instead of Dry Fuel if desired.

$1.00

Complete Outfit includes 5-Minute Vulcanizer, can of Dry Fuel, box of 12 Patches, Measuring Cup, and directions for repairs. Extra box of 12 Patches, 25c. Extra Fuel, 12 charges, 50c.

AND NOW—the only vulcanizer for tube punctures that is sure in its work, whether you use common gasoline or dry fuel. Vulcanizes a patch ***permanently*** in five minutes. Adamson Dry Fuel is flameless; it burns with hot glow; is furnished in a handy can; does not absorb dampness; and remains uniform under all conditions. This handy outfit weighs, complete, only one pound. Every motorist will want a New Adamson 5-Minute Vulanizer.

NEW PRICES ON

ADAMSON VULCANIZERS

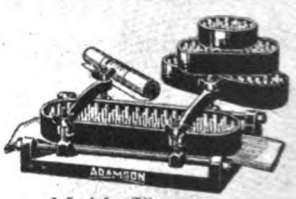
Model "U" For Cases and Tubes. **$2**

Model "T" For inner tubes only. **$1.50**

Greatly Increased Production

and the fact that we make Adamson Vulcanizers complete in our own plant, has cut down our manufacturing costs and enables us to make a substantial reduction in prices.

Adamson Vulcanizers are universally known as the simplest and surest in operation. More than a million motorists are now using and recommending them today.



At the old prices, they outsold all competing makes. At these new prices, and with the Dry Fuel feature of Model "E," Adamsons will sell faster than ever. They will pay you a handsome profit.

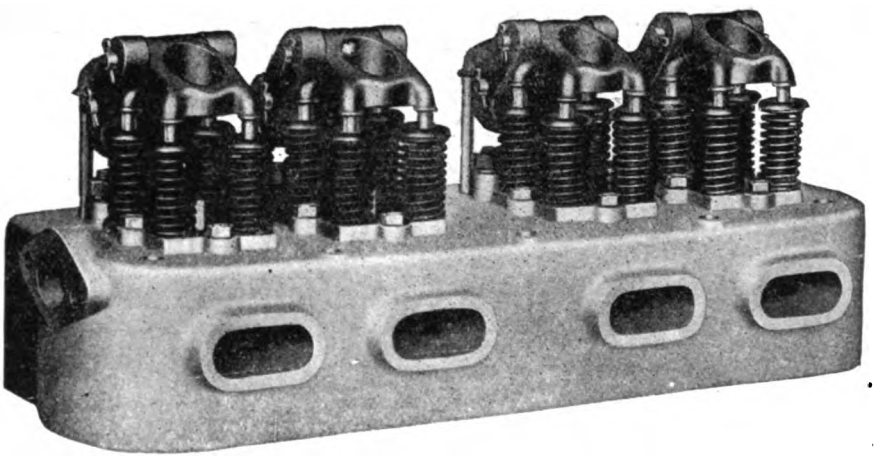
Ask your Jobber for Adamson Vulcanizers, and Adamson Repair Gum. Write us for Adamson Catalogs, Displays, and Selling Helps.

ADAMSON MFG. CO.

EAST PALESTINE, OHIO

We also make Adamson Ford Brake Shoes, Lined and Unlined.

Model "S" For private garages and repair shops. **$12**



Adamson Repair Gum for all portable vulcanizers

Photograph of converted Ford truck owned by Shapiro & Lemdowski, stock buyers of Joliet, Ill., after just returning from an eighteen mile trip and carrying 3600 lbs. of live hogs. Most of the drive was over roads that had not been broken and had snow up to the radiator, yet truck was continuously on high gear during the entire trip. Motor carries Roof sixteen over-head valve equipment. The pictures of Messrs. Shapiro and Lemdowski, and of Mr. Shea of the Shea Auto Company of Joliet, Central Illinois distributors, are also shown.

Price $95

16 Overhead Valves for Fords

Double the Value of Your CONVERTED FORD TRUCK

By Equipping with Roof's Peugeot Type Sixteen Over-Head Valve Equipment

Speed—with special gears, all the way up to 87 miles per hour—with regular gears, normal to 57 M. P. H., is as easy to get in a ROOF-equipped Ford as it is in any high-priced, high-power car on the road or race course.

Or in place of speed, there is extra power—reserve force for trucks and passenger cars—that takes you up hills and through mud or sand without a wheeze or falter, and at a distinct saving in fuel.

Actual test shows a reduction of one-fourth to one-third in gasoline consumption on touring cars and trucks and the most surprising increase in power.

ROOF-equipped Fords won race after race last summer. They brought back to life hundreds of old Ford passenger and commercial cars, and put new dealers on the map.

The demand for ROOF 16 Overhead Valves for Fords increases every day and so does the supply. They put new pep into Ford motors.

Complete equipment for installation goes with every head. Installation is easy and any good mechanic can make the change in a few hours. $95 gets the complete equipment, furnishing Ford owners with 16-Valve service for which buyers are glad to pay thousands of dollars in other cars.

DEALERS—Know this all-winter, all-year seller. The demand for use on passenger Fords and trucks is enough to put over big and growing profits now, and every day. The racing demand alone swamps dealers in season.

Write or Wire for Territory and Complete Details

HALLADAY BUMPERS

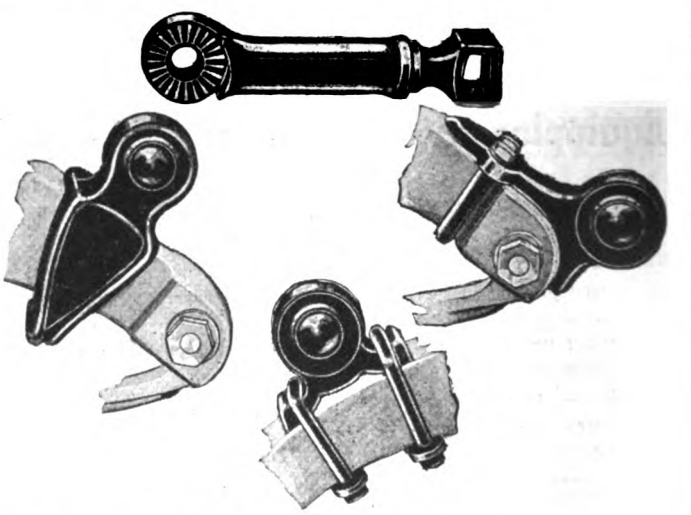
TWO BIG LEADERS FOR 1918

The New Halladay Multiple Spring Bar

The last word in Bumper Bar Strength, Elasticity and Efficiency.

Absorbs the Shock and Saves the Car.

Handsome in appearance; positively non-rattling.



Supplied with special fittings, as illustrated, or with any Halladay fitting front or rear.

The Halladay Standardized Bumper Units

The greatest bumper proposition ever offered the dealer.

By carrying a stock of these four parts, and a supply of our bumper bars, that dealer can assemble and fit perfectly 90% of all the cars on the market with front frame extensions and for the rear of practically all cars with rear extensions of three-quarter elliptic springs.

Write for our new catalog fully describing the Halladay line.

YOU CAN FIGURE IT OUT FOR YOURSELF

TOOLS For Repairing Automobiles

The possible curtailment of the manufacture of passenger cars will naturally bring all cars now in use more often to the Repair Shop. This puts a responsibility upon the Repair Man that must be met – more and more automobile repair tools will be required—are required right now—you can figure it out for yourself.

G. T. D. Tools are favorites the world over because of their easy cutting and lasting qualities.

Our line includes the following:

Taps and Dies, for both hand and machine use.

Screw Plates, both U. S. standard and S. A. E. standard threads, including combination assortments containing both standards.

Threading machines for bolts and nuts.

Reamers, all kinds, single and in sets. Also special Reamer for Ford Cars.

FOR THE MANUFACTURER

We have developed several new and decidedly better tools for machine threading. These are the "Gun" Tap—the "Shear-Cutting Tap," the "Acorn" Die and the Wells Self-Opening Die. These tools will positively boost production and reduce threading costs.

Send for catalog and booklets showing these and other tools for machine use. Ask for Gauge Bulletin "How to Measure Screw Threads."

PECK'S SUPER HEAT MANIFOLDS

Are Doing Their Bit

Enable Your Car to Meet War Time Requirements of Economy and Fuel Conservation.

Some of the things that PECK'S Super Heat Manifolds are guaranteed to do:

Type for Fords $7.50

West of Rocky Mountains, $8.50

If your car is not equipped with a PECK'S Super Heat Manifold, order one today. It is guaranteed to give you from 40 to 60% more miles per gallon, with the same efficiency that could be obtained with high-test gasoline.

Cut fuel costs; increase mileage; eliminate carbon; give more flexibility, greater power; stop over-heat of motor; prevent fouled spark plugs; save trouble and satisfy owners.

With the increased cost of gasoline and with the poor quality, it is necessary to use some means that will vaporize the fuel, so the highest efficiency may be obtained. PECK'S Super Heat is the way.

If Your Dealer Can Not Furnish You, Write to Us Direct.

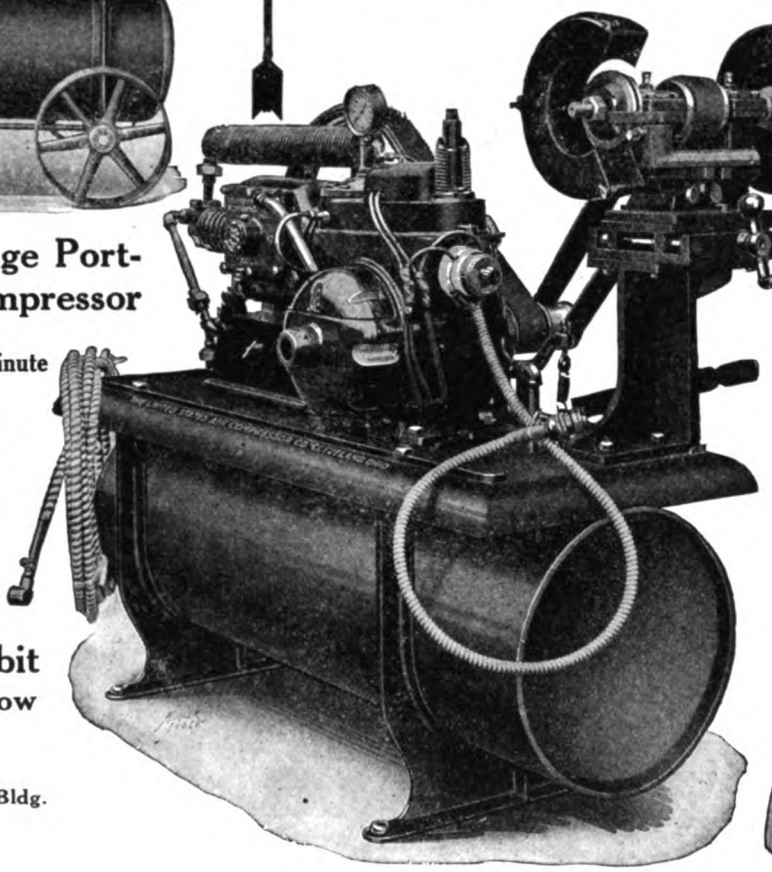
This buffing or grinder head is made according to the most approved design and is suitable for handling tire roughing wheels, and polishing or grinding wheels.

It will handle two wheels of 8-inch diameter and the construction is as strong and rigid as could be desired or required.



The motor is of sufficient capacity and the entire machine so designed as to permit the compressor and wheel head to be operated together or singly. Automatic controls prevent overcharging of the air tank and the entire construction of the unit is as near fool-proof as possible.

U. S. Two Stage Portable Air Compressor

EQUIPMENT 35

Cap. 4 Cu. Ft. Per Minute

Easily moved from place to place. Adapted for garages where it is sometimes desirable to take the air to the car or for factory use in blowing dust from motors, generators, etc.

See Our Exhibit At the Auto Show

BOSTON
Space 518, Mechanics Bldg.
March 2 to 9

U. S. Single Stage Automatic Air Unit

EQUIPMENT D22

(Illustrated Below)

Cap. 2½ Cu. Ft. Per Minute

An automatic single stage outfit for maintaining a supply of air ready for use at any time. Suitable for garage, free air service, etc.

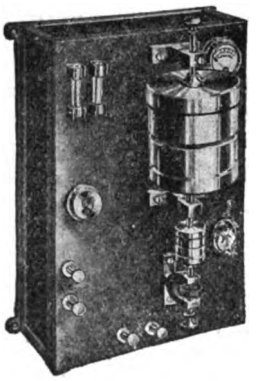
A New Money Saver for Garage and Tire Shop

AT the New York Auto Show tire repair and garage men saw, for the first time, a machine that exactly meets a crying need they had experienced for a long time. This machine was the **DeLuxe Combined Two Stage Automatic Air Compressor and Buffing or Grinder Head—Two Valuable Machines in One.**

Having known the DeLuxe Air Unit for several years as an unequalled success, and seeing the new improvements incorporated in a manner that assured absolutely satisfactory results, it is needless to say that an unprecedented number of orders were placed at once.

Before the addition of the valuable unit described above the DeLuxe Two Stage Air Compressor was recognized as the most highly refined and improved compressor in existence. With the incorporation of this very necessary unit its advantages are increased manifoldly, which places it in a class unapproached by any similar machine.

Every tire shop requires air facilities and tire roughing equipment, while every garage must have free air service and grinding wheel facilities. The practice has necessarily been to buy an air compressor with a motor and a buffing head with a motor or countershaft equipment from which to run it.



This new DeLuxe unit combines all this necessary equipment in one machine, to the definite and valuable advantage of purchasers. It saves the cost of an extra motor, avoids the necessity of buying a countershaft, conserves valuable floor space, saves expense in installation and gives results not only equal but superior to the old method.

The many advantages of the DeLuxe Combined Two Stage Automatic Air Compressor and Buffing or Grinder Head are described in detail in a special circular just issued. Write for a copy today.

THE BRECO ELECTRIC CO.

206 Huron Street Toledo, Ohio, U. S. A.

SOLE LICENCEES

900 Pages instead of 824 **1918—SIXTH EDITION** 3362 Illustrations instead of 2000

STILL $3.32 prepaid **Dyke's Auto Encyclopedia.** STILL $3.32 prepaid

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 **Instructions**—Simplified and practical.

3362 **Illustrations**—the kind you understand at a glance.

2 **Supplements**, parts printed in colors, treating on the construction operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc.

775 **Illustrations** and 279 pages on **Electric Ignition, Electric Starters and Generators**, etc.

51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on **Repairing.** Oxy-Acetylene Welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 180 illustrations on **Tires** and **Tire Repairing.**

44 pages and 119 illustrations on **Carburetion.**

89 pages and 291 illustrations on **Engine** and **Parts.**

16 pages on **Digest of Troubles.**

6000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. Index begins on colored paper, easy to refer to.

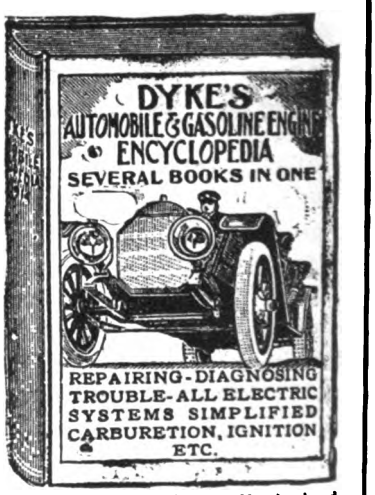
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

You must see this SIXTH Edition in order to appreciate just how complete a book it really is—Order N-O-W.

Price—Although a much larger and better book the price for the present remains **$3.00** (or **$3.28** prepaid, express).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand **Aviation, Truck and Tractor Engines** as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

WONDER WORKER

LIQUO-SEAL

A WONDERFUL CEMENT FOR LEAKY RADIATORS

LIQUO-SEAL not only finds leaks in radiators and fixes them, but prevents rust and scale from forming.

A small quantity is poured into the radiator and upon contact with the air it forms into cement, *immediately stopping the leak.*

Contains nothing to injure or clog up cooling system in finest honey-comb radiators.

Will automatically stop any new leaks from forming.

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar. Address:

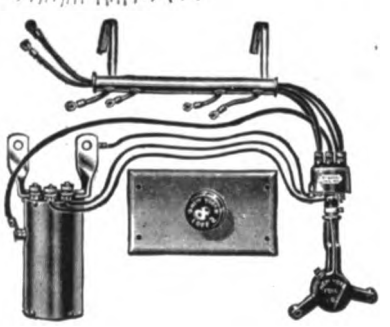
I AM PLEASING THOUSANDS
AND I CAN PLEASE YOU!

OUR **Double-Service Tire** is **Two Standard Make** tires bound together so that each strengthens the other—so that the two will give **More than Double** the service that either one alone could give. This joining together of **Two A-No. 1 Tires** by our process makes a tire that has **Double the Strength, Double the Fabric** and **Rubber,** and **Double** the **Thickness and Protection** for the inner tube, against the accidents and mishaps of the road, makes it **Absolutely Puncture-Proof and Cut-Proof.**

Our **Double Service** Tires are giving upwards of 6,500 miles of wear and service to Automobile Owners all over the United States, and they will give YOU that too, and with added security from punctures and cuts of all kinds.

Make sure when ordering tires to state whether Q. D., Straight bead or Clincher type.



We carry a full line of New First and New Second Tires at a big saving. Write for prices, mentioning sizes. Prices upon request.

Terms: 10% Deposit, Balance C. O. D.

SHALER
5 Minute Vulcanizer

Mends Tubes in 5 Minutes

Easy to Use— Easy to Sell

Every buyer of a SHALER 5-Minute Vulcanizer becomes a booster! Every motorist who buys one shows it to his friends—gives them a demonstration—because it is such a wonderful thing.

This means big sales for you. As soon as you start selling the SHALER 5-Minute Vulcanizer, your customers will spread the news. You will quickly notice new faces in your store—new customers passing their money across your counters.

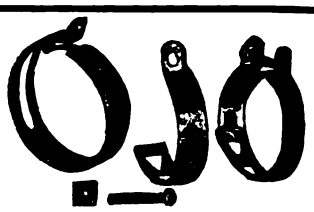
Complete Outfit **$1.50**
Including 12 Patch & Heat Units

The six round and oblong patches and combustible discs that go with the vulcanizer are soon used up—and the motorist comes back to you for more. He pays you 75 cents for every dozen of these units. You make a good profit.

Can you realize what a big repeat business this means for you? Can't you see how it will bring car owners into your place for additional "ammunition"—who will also buy other goods? And that is what you need to build up your business!

Place Your Order with Your Jobber NOW

Don't delay! The enormous demand for SHALER 5-Minute Vulanizers has exceeded our factory capacity to make deliveries. We are building a large 3-story addition to our plant. But—to make sure of prompt shipments—place your order with your jobber now—specifying date of shipment desired.



Complete Catalog of full line of SHALER Vulcanizers for Motorists, Garages and Repair Shops Mailed on Request.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much or all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything in for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the Pocket Edition at 50 cents, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

A JOURNAL OF PRACTICAL MOTORING

THE MOTOR VEHICLE PUBLISHING CO. - - - - 71-73 Murray Street, New York

Vol. 23, No. 3. NEW YORK, MAY, 1917 Monthly, $1.00 per year Single Copy 10 Cents

2¢ Will TIRE-DOH-ize The Ordinary Puncture

Copyright 1917, Atlas Auto Supply Co., Chicago

¶ Ten thousand dealers endorse Tire-Doh. They have learned that Tire-Doh is the most economical tire repair on the market. They know that it makes perfect repairs at small cost and leaves the repaired part stronger and better than the rest of the tire—that it does not require vulcanizing—that it eliminates the danger of overcuring or burning of the tube or casing—that it makes *permanent* repairs.

¶ They will tell how Tire-Doh repairs the most difficult kinds of inner tube tears, blowouts and punctures and how it can be used to fill up casing cuts, holes and sand blisters and add many extra miles to life of casings.

— NOT A TIRE FILLER —

¶ Tire-Doh is not a filler to replace air. It is a scientifically compounded preparation that becomes a permanent part of the tire. It requires no heat and no tools.

750,000 Users Now—And More to Follow

¶ In seven years of wonderful growth the sales of Tire-Doh have advanced to huge proportions. Merit and nation-wide advertising have made this possible. This year The Saturday Evening Post, Literary Digest, Christian Herald, Sunset Magazine, and other well known publications will tell the merits of Tire-Doh to several million more people.

¶ Almost any dealer can supply Tire-Doh. If yours can't, order direct and send us his name.

Dealers! All good jobbers recommend Tire-Doh. ***Send for handsome new window trims and hangers.*** Also specify quantity of circulars and blotters you desire imprinted with your name.

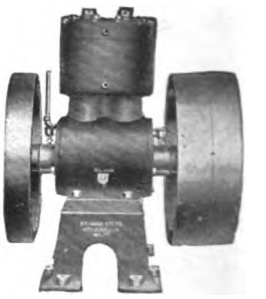
Along the roads macadamized
The Motorist who is Brunner-wised—
Speeds smooth-with danger minimized
Because his tires are Brunner-ized—

The pleasures of motoring are enhanced and the dangers are minimized when tires are properly inflated—smooth rides with danger of blow-outs lessened are insured by Brunner Service—and that is why the Brunnerwise Motorist patronizes the garage displaying the Brunner Sign.

Ever since the garage business has been a business the Brunner Air Compressor has been consistently demonstrating its sterling worth to the garageman **—in the garage.** Year after year the demand for Brunner Air Compressor Equipment has been doubling over, simply because the Brunner Air Compressor has always stood up and given satisfactory service. The motorist who patronizes the garage displaying the Brunner Sign always finds an ample supply of clean, cool air at the proper pressure to inflate his tires correctly at his disposal.

The Brunner Sign Attracts the Trade of the Brunnerwise Motorist

Because he knows that the garage displaying the Brunner Sign is always prepared to render him prompt and efficient compressed air service—he knows that when he pulls up under the Brunner Sign he never has to drive away disappointed.



He realizes that clean, cool air, such as he always finds at his disposal under the Brunner Sign, will increase his tire mileage and will reduce the dangers of motoring to a minimum. That is why the trade of the Brunnerwise Motorist follows the Brunner Sign.

The Safe Way Is the Brunner Way

The Brunner Air Compressor has always proven true to the Jobber who sells it—the Garageman who buys it—and the motorist who uses it—are you Brunnerwise?

The Garageman who buys Brunner Equipment is never disappointed for the reason that it has never been necessary to resort to misleading advertising claims in order to bolster up the sale of Brunner Equipment and the garageman purchasing Brunner Equipment always receives just what he expects and "a little bit more."

INVESTIGATE THE BRUNNER AIR COMPRESSOR

Be honest with yourself and investigate the garage air compressor question thoroughly before deciding on your new equipment. The Brunner will stand investigation and the more thorough the investigation the more certain will be your decision in favor of Brunner Service, because it not only insures compressed air efficiency of the very highest order, but it also insures that very desirable and liberal patronage of the Brunnerwise Motorist, which follows the Brunner Sign.

We will be glad to send you the name of the Brunner Jobber who covers your town, also our catalogue and Garageman's Handbook on Compressed Air—a book which every garageman should read carefully. They are all free for the asking.

Prismolite

The Perfected Lens

—Is Backed by the Laws

New York, Maryland, Ohio, Indiana, Iowa, Texas, Kansas, Nebraska, and South Dakota—have just passed laws restricting automobile headlights. Many other states are falling in line. The demand that the legislation is creating for special lenses that will meet the requirements is enormous—and—

Prismolite is the only convex diffusing lens that has been universally approved they meet every requirement—they are legally as well as mechanically perfect.

Prompt Shipment Guaranteed

Prismolite lens are produced by gigantic interests that already make more automobile lens than all other glass manufacturers combined—their capacity for production is enormous—for that reason prompt shipment is absolutely guaranteed on all orders.

4,000,000 Cars in Use

In the United States there are almost 4,000,000 automobiles in use today. Every owner of one of these cars is a prospective Prismolite customer. He must equip his headlights with a lens that is legally approved and *that means Prismolite.* Don't overlook this opportunity to cash in big from a nation-wide demand. Both jobbers and dealers should be stocked with Prismolite lens NOW. The sales are *certain*—the profit is large. Write or wire, today, for unusual Co-operative Sales Plan.

20,000 Perfect Prisms break up the rays—so that you see all the road—all the time.

Manufactured by Admirers of the FORD

The Truck That Hauls for Half

Make a 3000 Lb. Truck Out of Your Ford With a $350 Phenix

A GROUP of admirers of Henry Ford, all veterans in the motor field, have organized the PHENIX TRUCK MAKERS INC. for the purpose of manufacturing a truck attachment fully worthy of the Ford Chassis.

The Phenix Truck Maker is built to make the best possible 3000 to 4000 lb. truck out of the Ford. Carefully designed with this end in view, and having heavy frame, ball-bearing sprocket housings, alloy steel springs, and special brakes, it has proved its sturdiness under severest tests by delivering its pay load at a cost of only 5⅔ cents per ton mile.

The Phenix has a guaranteed capacity of 3000 pounds.

The Phenix organization is amply financed, and is backed by business men of undoubted standing. Its purpose is to produce heavy duty truck makers for long service, and to give not only the users but also its dealers the solid satisfaction of good goods and sincere dealings throughout.

A word from you will bring fullest details.

DEALERS: Allow us to present our proposition to you.

WHY TAKE A CHANCE?

Adjustable **METAL** Radiator Cover for All Model Ford Cars.

Attach this wonderful **metal** radiator cover and enjoy the pleasures of winter motoring without the troubles and discomforts.

No danger of water freezing with consequent breaking of radiator and cracking of cylinders. No cranking for twenty or thirty minutes in the cold and slush and snow. No fumbling with numbed fingers at a frozen leather roll or blanket.

Drive Your Ford All Winter

In the coldest weather—zero days. Let it stand for hours in the street, then start your engine at once. H-M Adjustable **Metal** Radiator Covers are operated from **the seat**. **When riding** set at quarter, half, three-quarter or fully open. When about to stop, turn the handle in the dash and the cover is tightly closed and your motor and radiator will be warm for hours.

It is made of sheet metal and will last many seasons. One winter's saving in fuel will more than pay for it. Attach it yourself in a few minutes.

Price $5.00

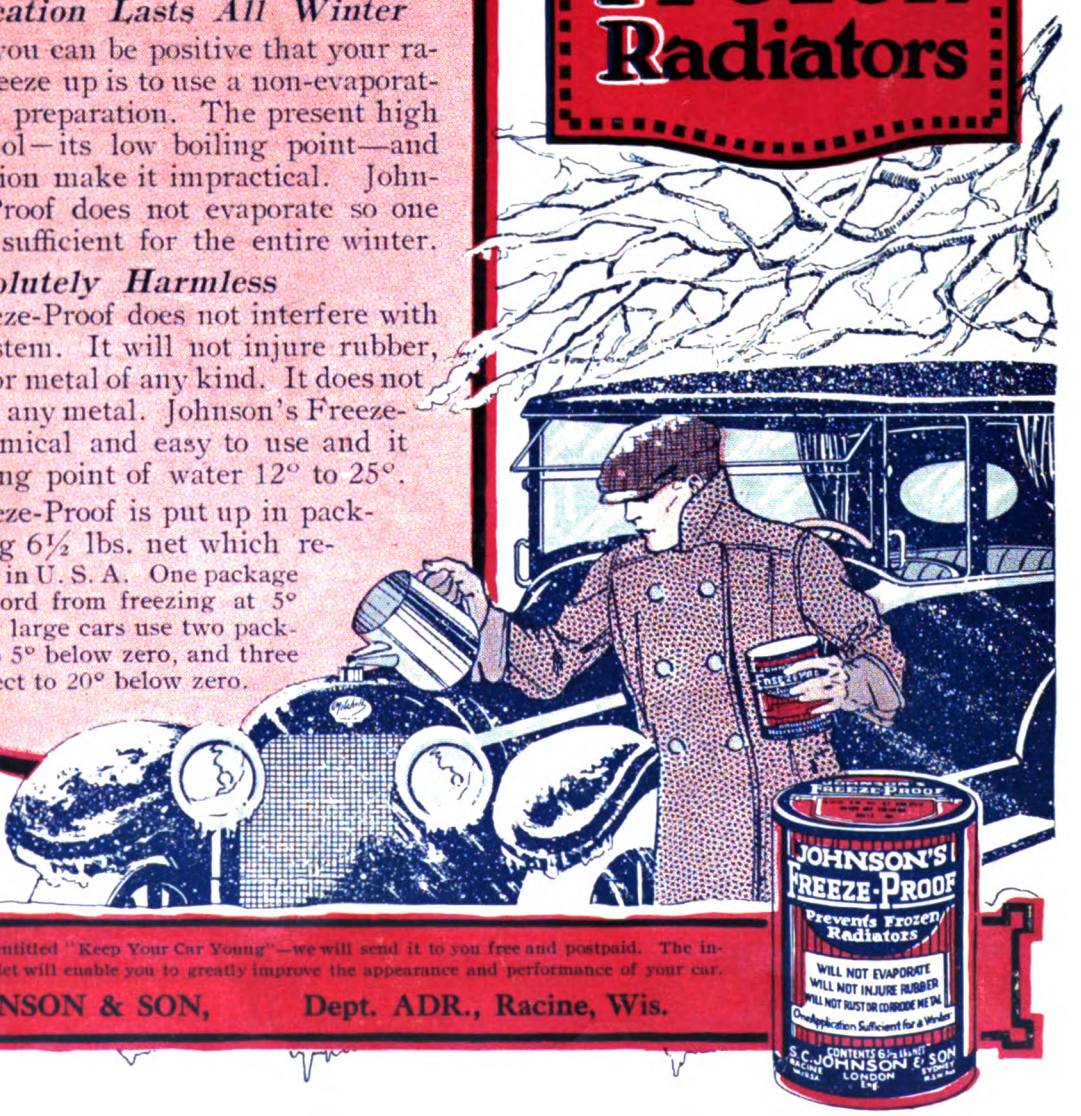
JOHNSON'S FREEZE-PROOF

One Application Lasts All Winter



The only way you can be positive that your radiator won't freeze up is to use a non-evaporating, anti-freeze preparation. The present high price of Alcohol—its low boiling point—and quick evaporation make it impractical. Johnson's Freeze-Proof does not evaporate so one application is sufficient for the entire winter.

Absolutely Harmless

Johnson's Freeze-Proof does not interfere with the cooling system. It will not injure rubber, cloth, packing or metal of any kind. It does not rust or corrode any metal. Johnson's Freeze-Proof is economical and easy to use and it raises the boiling point of water 12° to 25°.

Johnson's Freeze-Proof is put up in packages containing 6½ lbs. net which retail at $1.50 each in U. S. A. One package will protect a Ford from freezing at 5° below zero. For large cars use two packages to protect to 5° below zero, and three packages to protect to 20° below zero.

Prevents Frozen Radiators

Write for our booklet entitled "Keep Your Car Young"—we will send it to you free and postpaid. The information in this booklet will enable you to greatly improve the appearance and performance of your car.

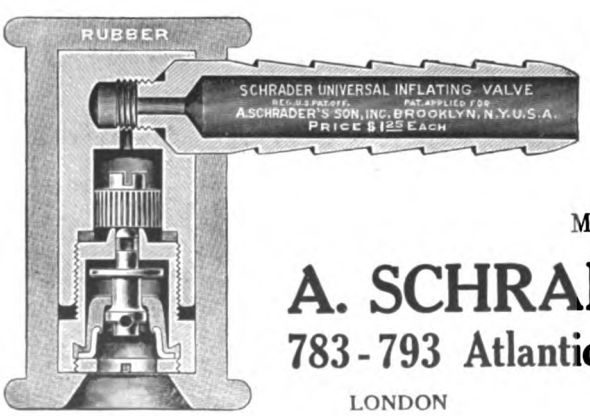
Garage Men!

FREE AIR COSTS MONEY

when the customers for whose convenience you provide an air station forget to turn off the flow after they have filled their tires.



Guard against this waste by attaching a

SCHRADER AUTOMATIC INFLATING VALVE

to your air hose

The Schrader Inflating Valve automatically locks the bottled air into the tank the minute it is taken off the tire valve. You turn on the air by pressing the nozzle of the inflating valve against the tire valve, and you turn it off by removing the device from the tire valve.

It is made to fit any diameter of stock sizes of hose, from one-quarter inch to five-eighths.

WITCHELL AIR GAUGE

Tires and Gasoline are War Necessities

Economy of These is a Patriotic Duty

THE LESS YOU USE THE MORE THERE WILL BE FOR SUPPLY TRAINS AND ARMY AMBULANCES.

When you run your car on insufficiently inflated tires you are wasting tires and gasoline.

You can help the boys in the trenches and be in a nice little sum of money besides if you'll make it a point never to run on under-inflated tires.

The way to know when your tires are inflated up to the correct pressure is to measure the air in them with a

TWITCHELL AIR GAUGE

at your dealer's or

The Twitchell Gauge Co., 1516 So. Wabash Ave., Chicago

PRICE $1.25

TO DEALERS

The Twitchell Gauge is now packed in dozen lots for mounting on an attractive counter display easel. Dealers having used this rack for the presentation of Twitchell Gauges report their sales very materially increased thereby.
The Twitchell is as easy to sell as it is to use. We advertise it in a dozen magazines, including the Saturday Evening Post, Collier's, The Literary Digest, Life and Leslie's, and it enjoys in addition even more valuable word-of-mouth advertising which thousands of enthusiastic purchasers have been giving it for the past seven years.

Stop that Leak

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, motor head gaskets, hose connections, etc., is to use Johnson's Radiator Cement. This will stop the leaks in just a few minutes, without laying up the car. No mechanical experience is required—all you have to do is to remove the cap and pour the cement into the radiator. It will ordinarily seal a leak in from two to ten minutes.

JOHNSON'S RADIATOR CEMENT

Quick—Efficient—Harmless

Johnson's Radiator Cement contains no powders, cement or anything which can coat or clog the cooling system. It blends perfectly with the water until it reaches the leak—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water, making a permanent seal.

If your dealer cannot supply you, send us $1.00 and we will forward you by prepaid express a pint can of Johnson's Radiator Cement.

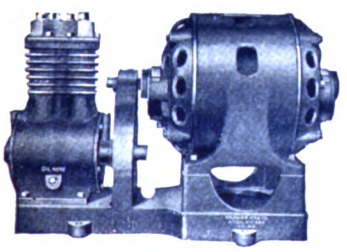
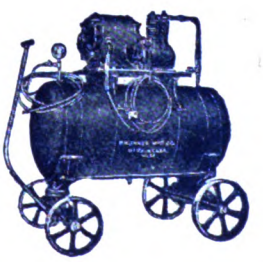
With pleasing smile and twinkling eyes
The garagemen who are Brunnerwise
Will tell you where the secret lies
Of an air supply which satisfies—



Yes; the Garagemen using Brunner Air Compressors will tell you that Brunner Service satisfies and they will tell you that all of their bothersome compressed air troubles have been eliminated since they have installed the Brunner Air Compressor in their garage. Drop into the first garage you see displaying the Brunner sign and see if this is not so.

A Brunner Air Compressor in your garage would eliminate all of your compressed air troubles—and it would enable you to render your patrons a highly efficient, absolutely reliable compressed air service such as they would appreciate.



A Brunner Service Sign on your garage would advertise the fact that your garage is strictly up-to-date—it would bring to your door the trade of the Brunnerwise Motorist who recognizes the Brunner Sign as a sure sign of prompt and efficient service.

INVESTIGATE THE BRUNNER AIR COMPRESSOR

The Brunner is the pioneer of all Garage Air Compressors—it has been making good in the garage ever since the garage business has been a business—the Brunner Air Compressor is properly designed and built to suit the garageman's special requirements. No freakish attachments and no restriction of the lubrication to invite disaster but simply the same good substantial business proposition it has always been for the garageman who progresses with the times.

Our new No. 15 Catalogue is the most complete and comprehensive book of its kind ever published. We will be glad to send you the catalogue and the name of the Brunner Jobber who covers your territory.

Increases Power

Saves Gasoline

JOHNSON'S CARBON REMOVER

REGULAR use of Johnson's Carbon Remover —once every 500 or 1000 miles—will cure 80% of your engine troubles, and keep the engine right up to the top notch of efficiency all the time. It will increase your power, save 12% to 25% of the gasoline and reduce maintenance expense.

Johnson's Carbon Remover puts new life in your engine. It cleans out carbon, stops knocking and pounding, gives more power on hills, improves the "pick-up" and restores the original "pep" and smoothness.

With proper carbon removal, you'll have better compression and less valve grinding, less ignition trouble and lower oil consumption. Johnson's Carbon Remover is easier, quicker, less expensive, and more effective than any other method — more effective because it is thorough and because you won't neglect to use it often after the first trial.

Do It Yourself—No Trouble

Simply pour an ounce of Johnson's Carbon Remover into each cylinder in the evening. Over night it soaks into the accumulated carbon and leaves it a soft inflammable mass. When you start your engine the next morning this mass burns, pulverizes and is blown out with the exhaust in powder form.
